Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	1536
Total RAM Bits	18432
Number of I/O	71
Number of Gates	60000
Voltage - Supply	1.14V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-20°C ~ 85°C (TJ)
Package / Case	100-TQFP
Supplier Device Package	100-VQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/agln060v2-vq100

User Nonvolatile FlashROM

IGLOO nano devices have 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications:

- Internet protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, set-top boxes)
- Secure key storage for secure communications algorithms
- Asset management/tracking
- Date stamping
- Version management

The FlashROM is written using the standard IGLOO nano IEEE 1532 JTAG programming interface. The core can be individually programmed (erased and written), and on-chip AES decryption can be used selectively to securely load data over public networks (except in the AGLN030 and smaller devices), as in security keys stored in the FlashROM for a user design.

The FlashROM can be programmed via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing. Note that the FlashROM can only be programmed from the JTAG interface and cannot be programmed from the internal logic array.

The FlashROM is programmed as 8 banks of 128 bits; however, reading is performed on a byte-by-byte basis using a synchronous interface. A 7-bit address from the FPGA core defines which of the 8 banks and which of the 16 bytes within that bank are being read. The three most significant bits (MSBs) of the FlashROM address determine the bank, and the four least significant bits (LSBs) of the FlashROM address define the byte.

The IGLOO nano development software solutions, Libero® System-on-Chip (SoC) and Designer, have extensive support for the FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature enables the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using Microsemi Libero SoC and Designer software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

SRAM and FIFO

IGLOO nano devices (except the AGLN030 and smaller devices) have embedded SRAM blocks along their north and south sides. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro (except in the AGLN030 and smaller devices).

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal Empty and Full flags. The embedded FIFO control unit contains the counters necessary for generation of the read and write address pointers. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

PLL and CCC

Higher density IGLOO nano devices using either the two I/O bank or four I/O bank architectures provide designers with very flexible clock conditioning capabilities. AGLN060, AGLN125, and AGLN250 contain six CCCs. One CCC (center west side) has a PLL. The AGLN030 and smaller devices use different CCCs in their architecture (CCC-GL). These CCC-GLs contain a global MUX but do not have any PLLs or programmable delays.

For devices using the six CCC block architecture, these are located at the four corners and the centers of the east and west sides. All six CCC blocks are usable; the four corner CCCs and the east CCC allow simple clock delay operations as well as clock spine access.

PLL Behavior at Brownout Condition

Microsemi recommends using monotonic power supplies or voltage regulators to ensure proper power-up behavior. Power ramp-up should be monotonic at least until VCC and VCCPLX exceed brownout activation levels (see Figure 2-1 and Figure 2-2 on page 2-5 for more details).

When PLL power supply voltage and/or VCC levels drop below the VCC brownout levels (0.75 V ± 0.25 V for V5 devices, and 0.75 V ± 0.2 V for V2 devices), the PLL output lock signal goes LOW and/or the output clock is lost. Refer to the "Brownout Voltage" section in the "Power-Up/-Down Behavior of Low Power Flash Devices" chapter of the *IGLOO nano FPGA Fabric User's Guide* for information on clock and lock recovery.

Internal Power-Up Activation Sequence

1. Core
2. Input buffers
3. Output buffers, after 200 ns delay from input buffer activation

To make sure the transition from input buffers to output buffers is clean, ensure that there is no path longer than 100 ns from input buffer to output buffer in your design.

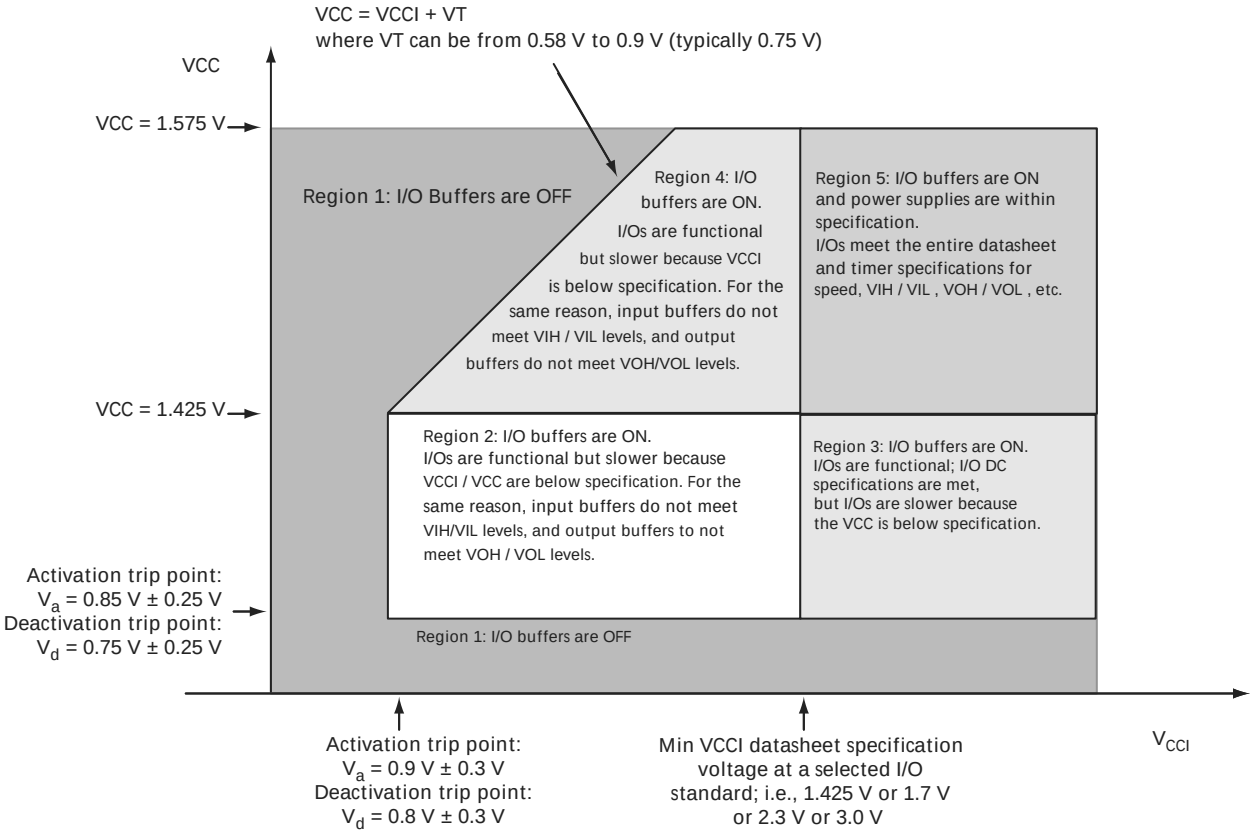

Figure 2-1 • **V5 Devices – I/O State as a Function of VCCI and VCC Voltage Levels**

Applies to IGLOO nano at 1.5 V Core Operating Conditions

Table 2-25 • **Summary of I/O Timing Characteristics—Software Default Settings**
STD Speed Grade, Commercial-Case Conditions: T_J = 70°C, Worst-Case VCC = 1.425 V,
Worst-Case VCCI = 3.0 V

I/O Standard	Drive Strength (mA)	Equivalent Software Default Drive Strength Option[1]	Slew Rate	Capacitive Load (pF)	t_{DOUT}	t_{DP}	t_{DIN}	t_{PY}	t_{PYS}	t_{EOUT}	t_{ZL}	t_{ZH}	t_{LZ}	t_{HZ}	Units

Notes:

1. *The minimum drive strength for any LVCMOS 1.2 V or LVCMOS 3.3 V software configuration when run in wide range is ±100 µA. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.*
2. *All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range, as specified in the JESD8-B specification.*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*

Detailed I/O DC Characteristics

Table 2-27 • **Input Capacitance**

Symbol	Definition	Conditions	Min.	Max.	Units
C_{IN}	Input capacitance	VIN = 0, f = 1.0 MHz		8	pF
C_{INCLK}	Input capacitance on the clock pin	VIN = 0, f = 1.0 MHz		8	pF

Table 2-28 • **I/O Output Buffer Maximum Resistances [1]**

Standard	Drive Strength	$R_{PULL\text{-}DOWN}$ (Ω)[2]	$R_{PULL\text{-}UP}$ (Ω)[3]
3.3 V LVTTL / 3.3V LVCMOS	2 mA	100	300
	4 mA	100	300
	6 mA	50	150
	8 mA	50	150
3.3 V LVCMOS Wide Range	100 µA	Same as equivalent software default drive	
2.5 V LVCMOS	2 mA	100	200
	4 mA	100	200
	6 mA	50	100
	8 mA	50	100
1.8 V LVCMOS	2 mA	200	225
	4 mA	100	112
1.5 V LVCMOS	2 mA	200	224
1.2 V LVCMOS [4]	1 mA	315	315
1.2 V LVCMOS Wide Range [4]	100 µA	315	315

Notes:

1. *These maximum values are provided for informational reasons only. Minimum output buffer resistance values depend on VCCI, drive strength selection, temperature, and process. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models posted at http://www.microsemi.com/soc/download/ibis/default.aspx.*
2. $R_{(PULL\text{-}DOWN\text{-}MAX)}$ *= (VOLspec) / IOLspec*
3. $R_{(PULL\text{-}UP\text{-}MAX)}$ *= (VCCImax – VOHspec) /* I_{OHspec}
4. *Applicable to IGLOO nano V2 devices operating at VCCI ≥ VCC.*

Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard–dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-70. Table 2-88 to Table 2-96 on page 2-68 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

Timing Characteristics

1.5 V DC Core Voltage

Table 2-88 • **AGLN010 Global Resource**
Commercial-Case Conditions: T_J = 70°C, VCC = 1.425 V

Parameter	Description	Std.		Units
		Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	1.13	1.42	ns
t_{RCKH}	Input High Delay for Global Clock	1.15	1.50	ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock	1.40		ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock	1.65		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.35	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*

Table 2-89 • **AGLN015 Global Resource**
Commercial-Case Conditions: T_J = 70°C, VCC = 1.425 V

Parameter	Description	Std.		Units
		Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	1.21	1.55	ns
t_{RCKH}	Input HIgh Delay for Global Clock	1.23	1.65	ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock	1.40		ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock	1.65		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.42	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*

Table 2-90 • **AGLN020 Global Resource**
Commercial-Case Conditions: T_J = 70°C, VCC = 1.425 V

Parameter	Description	Std.		Units
		Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	1.21	1.55	ns
t_{RCKH}	Input High Delay for Global Clock	1.23	1.65	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	1.40		ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	1.65		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.42	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*

Table 2-91 • **AGLN060 Global Resource**
Commercial-Case Conditions: T_J = 70°C, VCC = 1.425 V

Parameter	Description	Std.		Units
		Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	1.32	1.62	ns
t_{RCKH}	Input High Delay for Global Clock	1.34	1.71	ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock	1.40		ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock	1.65		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.38	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*

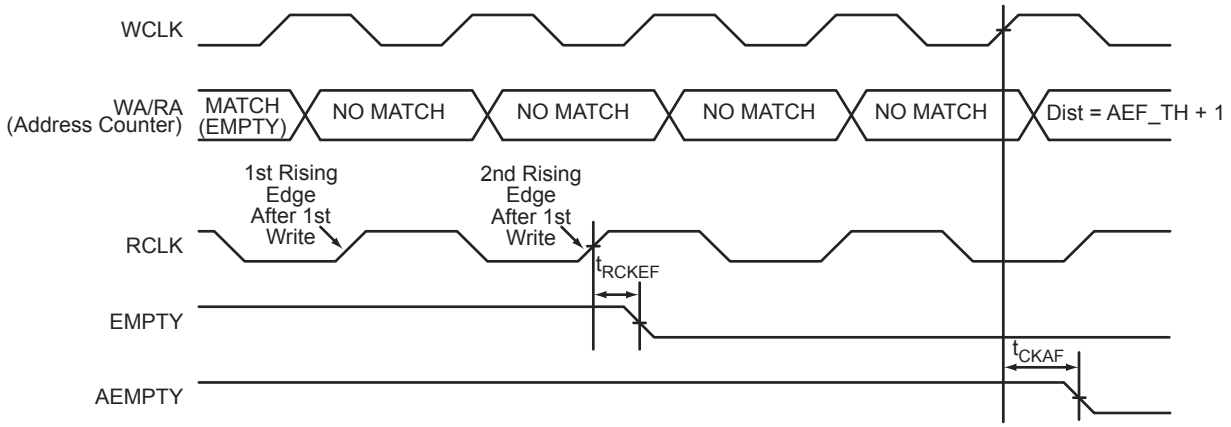

Figure 2-39 • **FIFO EMPTY Flag and AEMPTY Flag Deassertion**

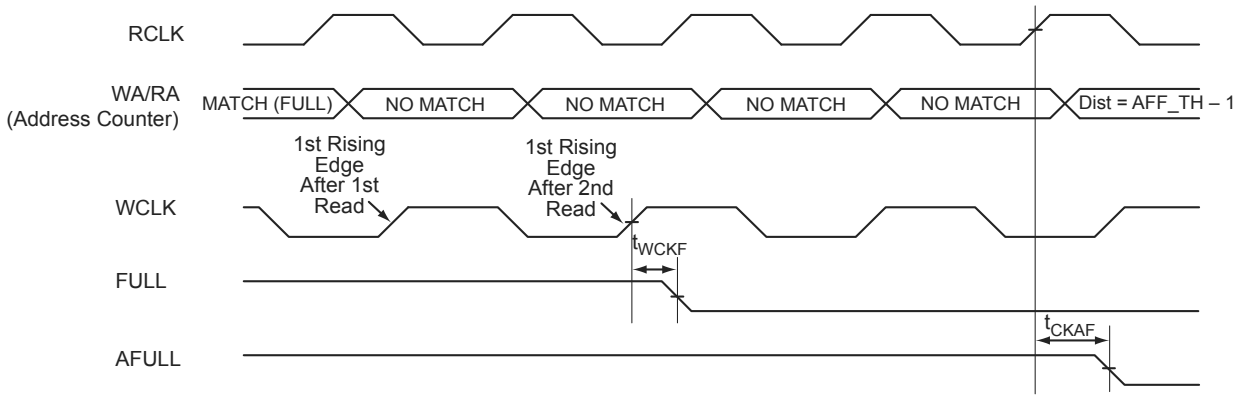

Figure 2-40 • **FIFO FULL Flag and AFULL Flag Deassertion**

3 – Pin Descriptions

Supply Pins

GND **Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

GNDQ **Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

VCC **Core Supply Voltage**

Supply voltage to the FPGA core, nominally 1.5 V for IGLOO nano V5 devices, and 1.2 V or 1.5 V for IGLOO nano V2 devices. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

VCCIBx **I/O Supply Voltage**

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to eight I/O banks on low power flash devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCIBx supply. VCCI can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VCCI pins tied to GND.

VMVx **I/O Supply Voltage (quiet)**

Quiet supply voltage to the input buffers of each I/O bank. *x* is the bank number. Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks. This minimizes the noise transfer within the package and improves input signal integrity. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMVx supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMVx can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCIB0, VMV1 to VCCIB1, etc.).

VCCPLA/B/C/D/E/F **PLL Supply Voltage**

Supply voltage to analog PLL, nominally 1.5 V or 1.2 V.

When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in IGLOO and ProASIC3 Devices" chapter in the *IGLOO nano FPGA Fabric User's Guide* for a complete board solution for the PLL analog power supply and ground.

There is one VCCPLF pin on IGLOO nano devices.

VCOMPLA/B/C/D/E/F **PLL Ground**

Ground to analog PLL power supplies. When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.

There is one VCOMPLF pin on IGLOO nano devices.

VJTAG **JTAG Supply Voltage**

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG

5 – Datasheet Information

List of Changes

The following table lists critical changes that were made in each version of the IGLOO nano datasheet.

Revision	Changes	Page
Revision 19 (October 2015)	Modified the note to include device/package obsoletion information in "Features and Benefits" section (SAR 69724).	1-I
	Added a note under Security Feature "Y" in "IGLOO nano Ordering Information" section (SAR 70553).	1-IV
	Modified AGLN250 pin assignment table to match with I/O Attribute Editor tool from Libero in "CS81" Package (SAR 59049).	4-6
	Modified the nominal area to 25 for CS81 Package in Table 1 (SAR 71127).	1-II
	Modified the title of AGLN125Z pin assignment table for "CS81" Package (SAR 71127).	4-6
Revision 18 (November 2013)	Modified the "Device Marking" section and updated Figure 1 • Example of Device Marking for Small Form Factor Packages to reflect updates suggested per CN1004 published on 5/10/2010 (SAR 52036).	V
Revision 17 (May 2013)	Deleted details related to Ambient temperature from "Enhanced Commercial Temperature Range", "IGLOO nano Ordering Information", "Temperature Grade Offerings", and Table 2-2 • Recommended Operating Conditions [1] to remove ambiguities arising due to the same, and modified Note 2 (SAR 47063).	I, IV, VI, and 2-2
Revision 16 (December 2012)	The "IGLOO nano Ordering Information" section has been updated to mention "Y" as "Blank" mentioning "Device Does Not Include License to Implement IP Based on the Cryptography Research, Inc. (CRI) Patent Portfolio" (SAR 43174).	IV
	The note in Table 2-100 • IGLOO nano CCC/PLL Specification and Table 2-101 • IGLOO nano CCC/PLL Specification referring the reader to SmartGen was revised to refer instead to the online help associated with the core (SAR 42565).	2-70, 2-71
	Live at Power-Up (LAPU) has been replaced with ’Instant On’.	NA
Revision 15 (September 2012)	The status of the AGLN125 device has been modified from ’Advance’ to ’Production’ in the "IGLOO nano Device Status" section (SAR 41416).	III
	Libero Integrated Design Environment (IDE) was changed to Libero System-on-Chip (SoC) throughout the document (SAR 40274).	NA
Revision 14 (September 2012)	The "Security" section was modified to clarify that Microsemi does not support read-back of programmed data.	1-2
Revision 13 (June 2012)	Figure Figure 2-34 • FIFO Read and Figure 2-35 • FIFO Write have been added (SAR 34842).	2-82
	The following sentence was removed from the "VMVx I/O Supply Voltage (quiet)" section in the "Pin Descriptions" section: "Within the package, the VMV plane is decoupled from the simultaneous switching noise originating from the output buffer VCCI domain" and replaced with “Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks” (SAR 38319). The datasheet mentions that "VMV pins must be connected to the corresponding VCCI pins" for an ESD enhancement.	3-1
