

Welcome to [E-XFL.COM](#)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Obsolete
Core Processor	ARM9®
Core Size	16/32-Bit
Speed	96MHz
Connectivity	CANbus, I ² C, IrDA, Microwire, SPI, SSP, UART/USART, USB
Peripherals	Brown-out Detect/Reset, DMA, POR, PWM, WDT
Number of I/O	40
Program Memory Size	2MB (2M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	96K x 8
Voltage - Supply (Vcc/Vdd)	1.65V ~ 2V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	80-LQFP
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/stmicroelectronics/str911fam47x6t

1 Description

STR91xFA is a series of ARM®-powered microcontrollers which combines a 16/32-bit ARM966E-S RISC processor core, dual-bank Flash memory, large SRAM for data or code, and a rich peripheral set to form an ideal embedded controller for a wide variety of applications such as point-of-sale terminals, industrial automation, security and surveillance, vending machines, communication gateways, serial protocol conversion, and medical equipment. The ARM966E-S core can perform single-cycle DSP instructions, good for speech processing, audio algorithms, and low-end imaging.

3.5 SRAM (64 Kbytes or 96 Kbytes)

A 32-bit wide SRAM resides on the CPU's Data TCM (D-TCM) interface, providing single-cycle data accesses. As shown in [Figure 1](#), the D-TCM shares SRAM access with the Advanced High-performance Bus (AHB). Sharing is controlled by simple arbitration logic to allow the DMA unit on the AHB to also access the SRAM.

3.5.1 Arbitration

Zero-wait state access occurs for either the D-TCM or the AHB when only one of the two is requesting SRAM. When both request SRAM simultaneously, access is granted on an interleaved basis so neither requestor is starved, granting one 32-bit word transfer to each requestor before relinquishing SRAM to the other. When neither the D-TCM or the AHB are requesting SRAM, the arbiter leaves access granted to the most recent user (if D-TCM was last to use SRAM then the D-TCM will not have to arbitrate to get access next time).

The CPU may execute code from SRAM through the AHB. There are no wait states as long as the D-TCM is not contending for SRAM access and the AHB is not sharing bandwidth with peripheral traffic. The ARM966E-S CPU core has a small pre-fetch queue built into this instruction path through the AHB to look ahead and fetch instructions during idle bus cycles.

3.5.2 Battery backup

When a battery is connected to the designated battery backup pin (VBATT), SRAM contents are automatically preserved when the operating voltage on the main digital supplies (VDD and VDDQ) are lost or sag below the LVD threshold. Automatic switchover to SRAM can be disabled by firmware if it is desired that the battery will power only the RTC and not the SRAM during standby.

3.6 DMA data movement

DMA channels on the Advanced High-performance Bus (AHB) take full advantage of the separate data path provided by the Harvard architecture, moving data rapidly and largely independent of the instruction path. There are two DMA units, one is dedicated to move data between the Ethernet interface and SRAM, the other DMA unit has eight programmable channels with 14 request signals to service other peripherals and interfaces (USB, SSP, ADC, UART, Timers, EMI, and external request pins). Both single word and burst DMA transfers are supported. Memory-to-memory transfers are supported in addition to memory-peripheral transfers. DMA access to SRAM is shared with D-TCM accesses, and arbitration is described in [Section 3.5.1](#). Efficient DMA transfers are managed by firmware using linked list descriptor tables. Of the 16 DMA request signals, two are assigned to external inputs. The DMA unit can move data between external devices and resources inside the STR91xFA through the EMI bus.

3.7 Non-volatile memories

There are two independent 32-bit wide burst Flash memories enabling true read-while-write operation. The Flash memories are single-voltage erase/program with 20 year minimum data retention and 100K minimum erase cycles. The primary Flash memory is much larger than the secondary Flash.

Both Flash memories are blank when devices are shipped from ST. The CPU can boot only from Flash memory (configurable selection of which Flash bank).

Flash memories are programmed half-word (16 bits) at a time, but are erased by sector or by full array.

3.7.1 Primary Flash memory

Using the STR91xFA device configuration software tool and 3rd party Integrated Developer Environments, it is possible to specify that the primary Flash memory is the default memory from which the CPU boots at reset, or otherwise specify that the secondary Flash memory is the default boot memory. This choice of boot memory is non-volatile and stored in a location that can be programmed and changed only by JTAG In-System Programming. See [Section 6: Memory mapping](#), for more detail.

The primary Flash memory has equal length 64K byte sectors. See [Table 3](#) for number of sectors per device type.

Table 3. Sectoring of primary Flash memory

Size of primary Flash	256 Kbytes	512 Kbytes	1 Mbyte	2 Mbytes
Number of sectors	4	8	16	32
Size of each sector	64 Kbytes		64 Kbytes	

3.7.2 Secondary Flash memory

The smaller of the two Flash memories can be used to implement a bootloader, capable of storing code to perform robust In-Application Programming (IAP) of the primary Flash memory. The CPU executes code from the secondary Flash, while updating code in the primary Flash memory. New code for the primary Flash memory can be downloaded over any of the interfaces on the STR91xFA (USB, Ethernet, CAN, UART, etc.)

Additionally, the secondary Flash memory may also be used to store small data sets by emulating EEPROM through firmware, eliminating the need for external EEPROM memories. This raises the data security level because passcodes and other sensitive information can be securely locked inside the STR91xFA device.

The secondary Flash memory is sectorized as shown in [Table 4](#) according to device type.

Both the primary Flash memory and the secondary Flash memory can be programmed with code and/or data using the JTAG In-System Programming (ISP) channel, totally independent of the CPU. This is excellent for iterative code development and for manufacturing.

Each of 4 remaining interrupt requests generated by the wake-up unit (IRQ26 in [Table 6](#)) are derived from groupings of 8 interrupt sources. One group is from GPIO pins P3.2 to P3.7 plus the RTC interrupt and the USB Resume interrupt; the next group is from pins P5.0 to P5.7; the next group is from pins P6.0 to P6.7; and last the group is from pins P7.0 to P7.7. This allows individual pins to be assigned directly to vectored IRQ interrupts or one pin assigned directly to the non-vectored FIQ interrupt.

Table 6. VIC IRQ channels

IRQ channel hardware priority	VIC input channel	Logic block	Interrupt source
0 (high priority)	VIC0.0	Watchdog	Timeout in WDT mode, Terminal Count in Counter Mode
1	VIC0.1	CPU Firmware	Firmware generated interrupt
2	VIC0.2	CPU Core	Debug Receive Command
3	VIC0.3	CPU Core	Debug Transmit Command
4	VIC0.4	TIM Timer 0	Logic OR of ICI0_0, ICI0_1, OCI0_0, OCI0_1, Timer overflow
5	VIC0.5	TIM Timer 1	Logic OR of ICI1_0, ICI1_1, OCI1_0, OCI1_1, Timer overflow
6	VIC0.6	TIM Timer 2	Logic OR of ICI2_0, ICI2_1, OCI2_0, OCI2_1, Timer overflow
7	VIC0.7	TIM Timer 3	Logic OR of ICI3_0, ICI3_1, OCI3_0, OCI3_1, Timer overflow
8	VIC0.8	USB	Logic OR of high priority USB interrupts
9	VIC0.9	USB	Logic OR of low priority USB interrupts
10	VIC0.10	CCU	Logic OR of all interrupts from Clock Control Unit
11	VIC0.11	Ethernet MAC	Logic OR of Ethernet MAC interrupts via its own dedicated DMA channel.
12	VIC0.12	DMA	Logic OR of interrupts from each of the 8 individual DMA channels
13	VIC0.13	CAN	Logic OR of all CAN interface interrupt sources
14	VIC0.14	IMC	Logic OR of 8 Induction Motor Control Unit interrupts
15	VIC0.15	ADC	End of AtoD conversion interrupt
16	VIC1.0	UART0	Logic OR of 5 interrupts from UART channel 0
17	VIC1.1	UART1	Logic OR of 5 interrupts from UART channel 1
18	VIC1.2	UART2	Logic OR of 5 interrupts from UART channel 2
19	VIC1.3	I2C0	Logic OR of transmit, receive, and error interrupts of I2C channel 0
20	VIC1.4	I2C1	Logic OR of transmit, receive, and error interrupts of I2C channel 1
21	VIC1.5	SSP0	Logic OR of all interrupts from SSP channel 0
22	VIC1.6	SSP1	Logic OR of all interrupts from SSP channel 1
23	VIC1.7	BROWNOUT	LVD warning interrupt
24	VIC1.8	RTC	Logic OR of Alarm, Tamper, or Periodic Timer interrupts

Table 6. VIC IRQ channels (continued)

IRQ channel hardware priority	VIC input channel	Logic block	Interrupt source
25	VIC1.9	Wake-Up (all)	Logic OR of all 32 inputs of Wake-Up unit (30 pins, RTC, and USB Resume)
26	VIC1.10	Wake-up Group 0	Logic OR of 8 interrupt sources: RTC, USB Resume, pins P3.2 to P3.7
27	VIC1.11	Wake-up Group 1	Logic OR of 8 interrupts from pins P5.0 to P5.7
28	VIC1.12	Wake-up Group 2	Logic OR of 8 interrupts from pins P6.0 to P6.7
29	VIC1.13	Wake-up Group 3	Logic OR of 8 interrupts from pins P7.0 to P7.7
30	VIC1.14	USB	USB Bus Resume Wake-up (also input to wake-up unit)
31 (low priority)	VIC1.15	PFQ-BC	Special use of interrupts from Prefetch Queue and Branch Cache

3.10 Clock control unit (CCU)

The CCU generates a master clock of frequency f_{MSTR} . From this master clock the CCU also generates individually scaled and gated clock sources to each of the following functional blocks within the STR91xFA.

- CPU, f_{CPUCLK}
- Advanced High-performance Bus (AHB), f_{HCLK}
- Advanced Peripheral Bus (APB), f_{PCLK}
- Flash Memory Interface (FMI), f_{FMICLK}
- External Memory Interface (EMI), f_{BCLK}
- UART Baud Rate Generators, f_{BAUD}
- USB, f_{USB}

3.10.1 Master clock sources

The master clock in the CCU (f_{MSTR}) is derived from one of three clock input sources. Under firmware control, the CPU can switch between the three CCU inputs without introducing any glitches on the master clock output. Inputs to the CCU are:

- Main Oscillator (f_{OSC}). The source for the main oscillator input is a 4 to 25 MHz external crystal connected to STR91xFA pins X1_CPU and X2_CPU, or an external oscillator device connected to pin X1_CPU.
- PLL (f_{PLL}). The PLL takes the 4 to 25 MHz oscillator clock as input and generates a master clock output up to 96 MHz (programmable). By default, at power-up the master clock is sourced from the main oscillator until the PLL is ready (locked) and then the CPU may switch to the PLL source under firmware control. The CPU can switch back to the main oscillator source at any time and turn off the PLL for low-power operation. The PLL is always turned off in Sleep mode.
- RTC (f_{RTC}). A 32.768 kHz external crystal can be connected to pins X1_RTC and X2_RTC, or an external oscillator connected to pin X1_RTC to constantly run the real-time clock unit. This 32.768 kHz clock source can also be used as an input to the CCU to run the CPU in slow clock mode for reduced power.

As an option, there are a number of peripherals that do not have to receive a clock sourced from the CCU. The USB interface can receive an external clock on pin P2.7, TIM timers TIM0/ TIM1 can receive an external clock on pin P2.4, and timers TIM2/TIM3 on pin P2.5.

Figure 2. Clock control

3.10.2 Reference clock (RCLK)

The main clock (f_{MSTR}) can be divided to operate at a slower frequency reference clock (RCLK) for the ARM core and all the peripherals. The RCLK provides the divided clock for the ARM core, and feeds the dividers for the AHB, APB, External Memory Interface, and FMI units.

3.10.3 AHB clock (HCLK)

The RCLK can be divided by 1, 2 or 4 to generate the AHB clock. The AHB clock is the bus clock for the AHB bus and all bus transfers are synchronized to this clock. The maximum HCLK frequency is 96 MHz.

3.10.4 APB clock (PCLK)

The RCLK can be divided by 1, 2, 4 or 8 to generate the APB clock. The APB clock is the bus clock for the APB bus and all bus transfers are synchronized to this clock. Many of the peripherals that are connected to the AHB bus also use the PCLK as the source for external bus data transfers. The maximum PCLK frequency is 48 MHz.

3.11.2 Idle mode

In this mode the CPU suspends code execution and the CPU and FMI clocks are turned off immediately after firmware sets the Idle Bit. Various peripherals continue to run based on the settings of the mask registers that exist just prior to entering Idle Mode. There are 3 ways to exit Idle Mode and return to Run Mode:

- Any reset (external reset pin, watchdog, low-voltage, power-up, JTAG debug command)
- Any interrupt (external, internal peripheral, RTC alarm or interval)
- Input from wake-up unit on GPIO pins

Note: It is possible to remain in Idle Mode for the majority of the time and the RTC can be programmed to periodically wake up to perform a brief task or check status.

3.11.3 Sleep mode

In this mode all clock circuits except the RTC are turned off and main oscillator input pins X1_CPU and X2_CPU are disabled. The RTC clock is required for the CPU to exit Sleep Mode. The entire chip is quiescent (except for RTC and wake-up circuitry). There are three means to exit Sleep Mode and re-start the system:

- Some resets (external reset pin, low-voltage, power-up, JTAG debug command)
- RTC alarm
- Input from wake-up unit

3.12 Voltage supplies

The STR91xFA requires two separate operating voltage supplies. The CPU and memories operate from a 1.65V to 2.0V on the VDD pins, and the I/O ring operates at 2.7V to 3.6V on the VDDQ pins.

In Standby mode, both VDD and VDDQ must be shut down. Otherwise the specified maximum power consumption for Standby mode (I_{RTC_STBY} and I_{SRAM_STBY}) may be exceeded. Leakage may occur if only one of the voltage supplies is off.

3.12.1 Independent A/D converter supply and reference voltage

The ADC unit on 128-pin and 144-ball packages has an isolated analog voltage supply input at pin AVDD to accept a very clean voltage source, independent of the digital voltage supplies. Additionally, an isolated analog supply ground connection is provided on pin AVSS only on 128-pin and 144-ball packages for further ADC supply isolation. On 80-pin packages, the analog voltage supply is shared with the ADC reference voltage pin (as described next), and the analog ground is shared with the digital ground at a single point in the STR91xFA device on pin AVSS_VSSQ.

A separate external analog reference voltage input for the ADC unit is available on 128-pin and 144-ball packages at the AVREF pin for better accuracy on low voltage inputs. For 80-pin packages, the ADC reference voltage is tied internally to the ADC unit supply voltage at pin AVREF_AVDD, meaning the ADC reference voltage is fixed to the ADC unit supply voltage.

See [Table 11: Operating conditions](#), for restrictions to the relative voltage levels of VDDQ, AVDD, AVREF, and AVREF_AVDD.

7.11 External memory bus timings

$V_{DDQ} = 2.7 - 3.6 \text{ V}$, $V_{DD} = 1.65 - 2 \text{ V}$, $T_A = -40 / 85 \text{ }^{\circ}\text{C}$, $C_L = 30 \text{ pF}$ unless otherwise specified.

Table 32. EMI bus clock period

Symbol	Parameter ⁽¹⁾	Value ⁽²⁾
t_{BCLK}	EMI bus clock period	$1 / (f_{HCLK} \times \text{EMI_ratio})$

1. The internal EMI Bus clock signal is available externally only on LFBGA144 packages (ball M8), and not available on LQFP packages.
2. EMI_ratio = 1/ 2 by default (can be programmed to be 1 by setting the proper bits in the SCU_CLKCNTR register)

7.11.1 Asynchronous mode

Non Mux Write

Figure 18. Non-mux write timings

Table 33. EMI non-mux write operation

Symbol	Parameter	Value	
		Min	Max
t_{WCR}	WRn to CSn inactive	$(t_{BCLK}/2) - 2 \text{ ns}$	$(t_{BCLK}/2) + 2 \text{ ns}$
t_{WAS}	Write address setup time	$((\text{WSTWEN} + 1/2) \times t_{BCLK}) - 2 \text{ ns}$	$((\text{WSTWEN} + 1/2) \times t_{BCLK}) + 1 \text{ ns}$
t_{WDS}	Write data setup time	$((\text{WSTWEN} + 1/2) \times t_{BCLK}) - 5 \text{ ns}$	$((\text{WSTWEN} + 1/2) \times t_{BCLK})$
t_{WP}	Write pulse width	$(\text{WSTWR} - \text{WSTWEN} + 1) \times t_{BCLK} - 1 \text{ ns}$	$(\text{WSTWR} - \text{WSTWEN} + 1) \times t_{BCLK} + 1.5 \text{ ns}$

Ethernet MII management timings

Figure 27. Ethernet MII management timing diagram

Table 42. Ethernet MII management timing table

Symbol	Parameter	Symbol	Value		Unit
			Min	Max	
1	MDIO delay from rising edge of MDC	$t_c(\text{MDIO})$		2.83	ns
2	MDIO setup time to rising edge of MDC	$T_{su}(\text{MDIO})$	2.70		ns
3	MDIO hold time from rising edge of MDC	$T_h(\text{MDIO})$	-2.03		ns

Ethernet MII transmit timings

Figure 28. Ethernet MII transmit timing diagram

Table 43. Ethernet MII transmit timing table

Symbol	Parameter	Symbol	Value		Unit
			Min	Max	
1	MII_TX_CLK high to MII_TX_EN valid	$t_{VAL}(MII_TX_EN)$		4.20	ns
2	MII_TX_CLK high to MII_TX_EN invalid	$T_{inval}(MII_TX_EN)$		4.86	ns
3	MII_CRS valid to MII_TX_CLK high	$T_{su}(MII_CRS)$	0.61		ns
4	MII_TX_CLK high to MII_CRS invalid	$T_h(MII_CRS)$	0.00		ns
5	MII_COL valid to MII_TX_CLK high	$T_{su}(MII_COL)$	0.81		ns
6	MII_TX_CLK high to MII_COL invalid	$T_h(MII_COL)$	0.00		ns
7	MII_TX_CLK high to MII_TXD valid	$t_{VAL}(MII_TXD)$		5.02	ns
8	MII_TXCLK high to MII_TXD invalid	$T_{inval}(MII_TXD)$		5.02	ns

Ethernet MII receive timings

Figure 29. Ethernet MII receive timing diagram

Table 44. Ethernet MII receive timing table

Symbol	Parameter	Symbol	Value		Unit
			Min	Max	
1	MII_RXD valid to MII_RX_CLK high	$T_{su}(MII_RXD)$	0.81		ns
2	MII_RX_CLK high to MII_RXD invalid	$T_h(MII_RXD)$	0.00		ns

7.12.2 USB electrical interface characteristics

USB 2.0 Compliant in Full Speed Mode

7.12.3 CAN interface electrical characteristics

Conforms to CAN 2.0B protocol specification

9.1 ECOPACK

To meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions, and product status are available at www.st.com.

9.2 Thermal characteristics

The average chip-junction temperature, T_J must never exceed 125 °C.

The average chip-junction temperature, T_J , in degrees Celsius, may be calculated using the following equation:

$$T_J = T_A + (P_D \times \Theta_{JA}) \quad (1)$$

Where:

- T_A is the ambient temperature in °C,
- Θ_{JA} is the package junction-to-ambient thermal resistance, in °C/W,
- P_D is the sum of P_{INT} and $P_{I/O}$ ($P_D = P_{INT} + P_{I/O}$),
- P_{INT} is the product of I_{DD} and V_{DD} , expressed in Watts. This is the Chip Internal Power.

$P_{I/O}$ represents the power dissipation on input and output pins;

Most of the time for the applications $P_{I/O} < P_{INT}$ and may be neglected. On the other hand, $P_{I/O}$ may be significant if the device is configured to drive continuously external modules and/or memories. The worst case P_{INT} of the STR91xFA is 500 mW ($I_{DD} \times V_{DD}$, or 250 mA x 2.0 V).

An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is given by:

$$P_D = K / (T_J + 273 \text{ °C}) \quad (2)$$

Therefore (solving equations 1 and 2):

$$K = P_D \times (T_A + 273 \text{ °C}) + \Theta_{JA} \times P_D^2 \quad (3)$$

Where:

- K is a constant for the particular part, which may be determined from equation (3) by measuring P_D (at equilibrium) for a known T_A . Using this value of K, the values of P_D and T_J may be obtained by solving equations (1) and (2) iteratively for any value of T_A .

Table 53. Thermal characteristics

Symbol	Parameter	Value	Unit
Θ_{JA}	Thermal resistance junction-ambient LQFP 80 - 12 x 12 mm / 0.5 mm pitch	41.5	°C/W
Θ_{JA}	Thermal resistance junction-ambient LQFP128 - 14 x 14 mm / 0.4 mm pitch	38	°C/W
Θ_{JA}	Thermal resistance junction-ambient LFBGA 144 - 10 x 10 x 1.7 mm	36.5	°C/W

10 Ordering information

Table 54. Ordering information scheme

Example:	STR9	1	2	F	A	W	4	4	X	6	T
Family											
ARM9 microcontroller family											
Series											
1 = STR9 series 1											
Feature set											
0 = CAN, UART, IrDA, I2C, SSP											
1 = USB, CAN, UART, IrDA, I2C, SSP											
2 = USB, CAN, UART, IrDA, I2C, SSP, ETHERNET											
Memory type											
F = Flash											
Revision at product level											
A = Revision A											
No. of pins											
M = 80											
W = 128											
Z = 144											
SRAM size											
3 = 64 Kbytes											
4 = 96 Kbytes											
Primary memory size											
2 = 256 Kbytes 6= 1024 Kbytes											
4 = 512 Kbytes 7= 2048 Kbytes											
Package											
X = plastic LQFP											
H = LFBGA											
Temperature range											
6 = -40 to 85 °C											
Shipping option											
T = Tape and reel packing
