Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

[1] See Table 2.

Devices in the MPC8280 family are available in four packages—the standard ZU and VV packages and the alternate VR or ZQ packages—as shown in Table 2. Note that throughout this document, references to the MPC8280 and the MPC8270 are inclusive of VR and ZQ package devices unless otherwise specified. For more information on VR and ZQ packages, contact your Freescale sales office. For package ordering information, see Section 10, “Ordering Information.”

    - Provides management for BRI devices as general-circuit interface (GCI) controllers in time-division-multiplexed (TDM) channels
    - Transparent
    - UART (low-speed operation)
  - One serial peripheral interface identical to the MPC860 SPI
  - One I^2C controller (identical to the MPC860 I^2C controller)
    - Microwire compatible
    - Multiple-master, single-master, and slave modes
  - Up to eight TDM interfaces (four on the MPC8270)
    - Supports two groups of four TDM channels for a total of eight TDMs (one group of four on the MPC8270 and the MPC8275)
    - 2,048 bytes of SI RAM
    - Bit or byte resolution
    - Independent transmit and receive routing, frame synchronization
    - Supports T1, CEPT, T1/E1, T3/E3, pulse code modulation highway, ISDN basic rate, ISDN primary rate, Freescale interchip digital link (IDL), general circuit interface (GCI), and user-defined TDM serial interfaces
  - Eight independent baud rate generators and 20 input clock pins for supplying clocks to FCCs, SCCs, SMCs, and serial channels
  - Four independent 16-bit timers that can be interconnected as two 32-bit timers
- Inverse multiplexing for ATM capabilities (IMA) (MPC8280 only). Supported by eight transfer transmission convergence (TC) layers between the TDMs and FCC2.
- Transmission convergence (TC) layer (MPC8280 only)

2 Operating Conditions

This table shows the maximum electrical ratings.

Table 3. Absolute Maximum Ratings[1]

Rating	Symbol	Value	Unit
Core supply voltage[2]	VDD	–0.3 – 2.25	V
PLL supply voltage[2]	VCCSYN	–0.3 – 2.25	V
I/O supply voltage[3]	VDDH	–0.3 – 4.0	V
Input voltage[4]	VIN	GND(–0.3) – 3.6	V
Junction temperature	T_j	120	°C
Storage temperature range	T_{STG}	(–55) – (+150)	°C

[1] Absolute maximum ratings are stress ratings only; functional operation (see Table 4) at the maximums is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage.

6.2 SIU AC Characteristics

This table lists SIU input characteristics.

NOTE: CLKIN Jitter and Duty Cycle

The CLKIN input to the SoC should not exceed +/– 150 psec of jitter (peak-to-peak). This represents total input jitter—the combination of short term (cycle-to-cycle) and long term (cumulative). The duty cycle of CLKIN should not exceed the ratio of 40:60. The rise/file time of CLKIN should adhere to the typical SDRAM device AC clock requirement of 1 V/ns to meet SDRAM AC specs.

NOTE: Spread Spectrum Clocking

Spread spectrum clocking is allowed with 1% input frequency down-spread at maximum 60 KHz modulation rate regardless of input frequency.

NOTE: PCI AC Timing

The SoC meets the timing requirements of *PCI Specification Revision 2.2*. See Section 7, “Clock Configuration Modes,” and “Note: Tval (Output Hold)” to determine if a specific clock configuration is compliant.

[1] The “low” values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The “high” values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not violate the frequency rating of the user’s device. The minimum CPM frequency is 120 MHz. Minimum CPU frequency is determined by the clock mode. For modes with a CPU multiplication factor <= 3, the minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. For modes with a CPU multiplication factor >= 3.5: for Rev0.1 the minimum CPU frequency is 250 MHz; for Rev A or later the minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices.

[2] As Table 17 shows, PCI_MODCK determines the PCI clock frequency range. See Table 20 for lower configurations.

[3] MODCK_H = hard reset configuration word [28–31]. MODCK[1-3] = three hardware configuration pins.

[4] 60x and local bus frequency. Identical to CLKIN.

[5] CPM multiplication factor = CPM clock/bus clock

[6] CPU multiplication factor = Core PLL multiplication factor

[3] Must be pulled down or left floating.

[4] If PCI is not desired, must be pulled up or left floating.

[5] Sphere is not connected to die.

[6] GNDSYN (B18): This pin exists as a separate ground signal in MPC826x(A) devices; it does not exist as a separate ground signal on the MPC8275/MPC8270. New designs must connect B18 to GND and follow the suggestions in Section 4.6, “Layout Practices.” Old designs in which the MPC8275/MPC8270 is used as a drop-in replacement can leave the pin connected to GND with the noise filtering capacitors.

[7] XFC (A18) pin: This pin is used in MPC826x(A) devices; it is not used in MPC8275/MPC8270 because there is no need for external capacitor to operate the PLL. New designs should connect A18 (XFC) pin to GND. Old designs in which the MPC8275/MPC8270 is used as a drop-in replacement can leave the pin connected to the current capacitor.

9.1 Package Parameters

This table provides package parameters.

NOTE: Temperature Reflow for the VR Package

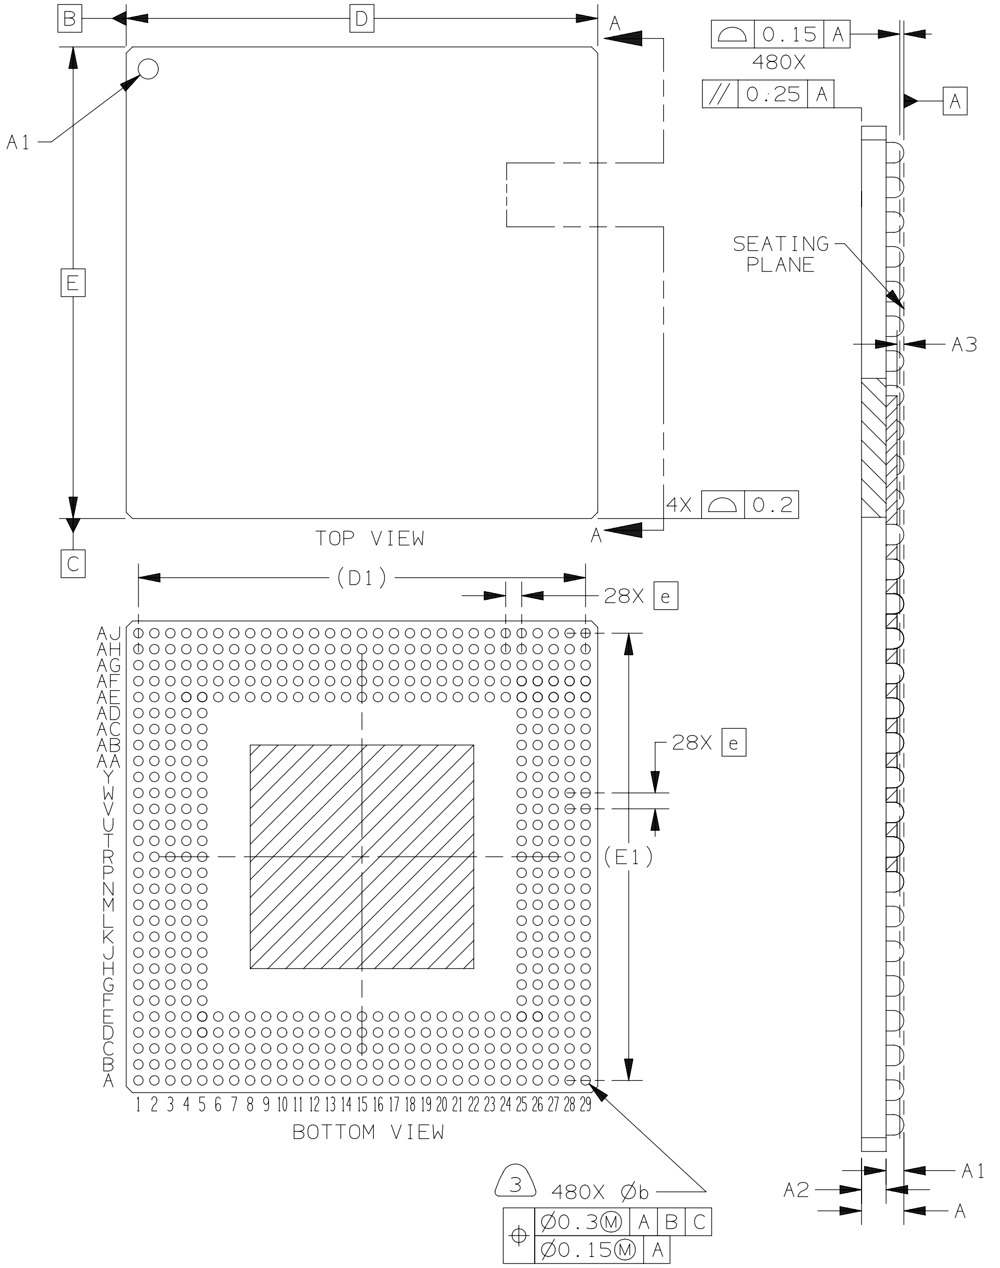
In the VR package, sphere composition is lead-free (see Table 2). This requires higher temperature reflow than what is required for other PowerQUICC II packages. Consult “Freescale PowerQUICC II Pb-Free Packaging Information” (MPC8250PBFREEPKG) available on www.freescale.com.

Table 26. Package Parameters

Package	SoCs	Outline (mm)	Type	Interconnects	Pitch (mm)	Nominal Unmounted Height (mm)
ZU	MPC8280 MPC8270	37.5 × 37.5	TBGA	480	1.27	1.55
VV	MPC8280 MPC8270	37.5 × 37.5	TBGA	480	1.27	1.55
VR	MPC8275VR MPC8270VR	27 × 27	PBGA	516	1	2.25
ZQ	MPC8275ZQ MPC8270ZQ	27 × 27	PBGA	516	1	2.25

9.2 Mechanical Dimensions

This figure provides the mechanical dimensions and bottom surface nomenclature of the 480 TBGA (ZU/VV) package. See Table 2, “HiP7 PowerQUICC II Device Packages.”



Dim	Millimeters	
	Min	Max
A	1.45	1.65
A1	0.60	0.70
A2	0.85	0.95
A3	0.25	—
b	0.65	0.85
D	37.50 BSC	
D1	35.56 REF	
e	1.27 BSC	
E	37.50 BSC	
E1	35.56 REF	

Notes:

1. Dimensions and Tolerancing per ASME Y14.5M-1994.
2. Dimensions in millimeters.
3. Dimension b is measured at the maximum solder ball diameter, parallel to primary data A.
4. Primary data A and the seating plane are defined by the spherical crowns of the solder balls.
