Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC G2_LE
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	333MHz
Co-Processors/DSP	Communications; RISC CPM
RAM Controllers	DRAM, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100Mbps (3)
SATA	-
USB	USB 2.0 (1)
Voltage - I/O	3.3V
Operating Temperature	-40°C ~ 105°C (TA)
Security Features	-
Package / Case	480-LBGA Exposed Pad
Supplier Device Package	480-TBGA (37.5x37.5)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc8280czuqlda

  - Common on-chip processor (COP) test interface
  - High-performance (SPEC95 benchmark at 450 MHz; 855 Dhrystones MIPS at 450 MHz)
  - Supports bus snooping
  - Support for data cache coherency
  - Floating-point unit (FPU)
- Separate power supply for internal logic and for I/O
- Separate PLLs for G2_LE core and for the communications processor module (CPM)
  - G2_LE core and CPM can run at different frequencies for power/performance optimization
  - Internal core/bus clock multiplier that provides ratios 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 4.5:1, 5:1, 6:1, 7:1, 8:1
  - Internal CPM/bus clock multiplier that provides ratios 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 5:1, 6:1, 8:1 ratios
- 64-bit data and 32-bit address 60x bus
  - Bus supports multiple master designs
  - Supports single- and four-beat burst transfers
  - 64-, 32-, 16-, and 8-bit port sizes controlled by on-chip memory controller
  - Supports data parity or ECC and address parity
- 32-bit data and 18-bit address local bus
  - Single-master bus, supports external slaves
  - Eight-beat burst transfers
  - 32-, 16-, and 8-bit port sizes controlled by on-chip memory controller
- 60x-to-PCI bridge
  - Programmable host bridge and agent
  - 32-bit data bus, 66.67/83.3/100 MHz, 3.3 V
  - Synchronous and asynchronous 60x and PCI clock modes
  - All internal address space available to external PCI host
  - DMA for memory block transfers
  - PCI-to-60x address remapping
- PCI bridge
  - PCI Specification Revision 2.2 compliant and supports frequencies up to 66 MHz
  - On-chip arbitration
  - Support for PCI-to-60x-memory and 60x-memory-to-PCI streaming
  - PCI host bridge or peripheral capabilities
  - Includes 4 DMA channels for the following transfers:
    - PCI-to-60x to 60x-to-PCI
    - 60x-to-PCI to PCI-to-60x
    - 60x-to-PCI to 60x-to-PCI

4 V_{IL} for IIC interface does not match IIC standard, but does meet IIC standard for V_{OL} and should not cause any compatibility issue.
5 MPC8280, MPC8275VR, MPC8275ZQ only.

4 Thermal Characteristics

This table describes thermal characteristics for both the packages. See Table 2 for information on a given SoC's package. Discussions of each characteristic are provided in Section 4.1, "Estimation with Junction-to-Ambient Thermal Resistance," and Section 4.5, "Experimental Determination." For the these discussions, $P_D = (V_{DD} \times I_{DD}) + PI/O$, where PI/O is the power dissipation of the I/O drivers.

Table 6. Thermal Characteristics

Characteristic	Symbol	Value		Unit	Air Flow
		480 TBGA	516 PBGA		
Junction to ambient—single-layer board[1]	$R_{\theta JA}$	16	27	°C/W	Natural convection
		11	21		1 m/s
Junction to ambient—four-layer board	$R_{\theta JA}$	12	19	°C/W	Natural convection
		9	16		1 m/s
Junction to board[2]	$R_{\theta JB}$	6	11	°C/W	—
Junction to case[3]	$R_{\theta JC}$	2	8	°C/W	—
Junction-to-package top[4]	Ψ_{JT}	2	2	°C/W	—

1 Assumes no thermal vias
2 Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
3 Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
4 Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

4.1 Estimation with Junction-to-Ambient Thermal Resistance

An estimation of the chip junction temperature, T_J, in °C can be obtained from the following equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

T_A = ambient temperature (°C)
$R_{\theta JA}$ = package junction-to-ambient thermal resistance (°C/W)
P_D = power dissipation in package

The junction-to-ambient thermal resistance is an industry standard value that provides a quick and easy estimation of thermal performance. However, the answer is only an estimate; test cases have demonstrated that errors of a factor of two (in the quantity $T_J - T_A$) are possible.

6 AC Electrical Characteristics

The following sections include illustrations and tables of clock diagrams, signals, and CPM outputs and inputs for 66.67/83.33/100 MHz devices. Note that AC timings are based on a 50-pf load for MAX Delay and 10-pf load for MIN delay. Typical output buffer impedances are shown in this table.

Table 8. Output Buffer Impedances[1]

Output Buffers	Typical Impedance (Ω)
60x bus	45 or 27[2]
Local bus	45
Memory controller	45 or 27[2]
Parallel I/O	45
PCI	27

1 These are typical values at 65° C. Impedance may vary by ±25% with process and temperature.

2 On silicon revision 0.0 (mask #: 0K49M), selectable impedance is not available. Impedance is set at 45 Ω.
On all other revisions, impedance value is selected through the SIUMCR[20,21]. See the SoC reference manual.

6.1 CPM AC Characteristics

This table lists CPM output characteristics.

Table 9. AC Characteristics for CPM Outputs[1]

Spec Number		Characteristic	Value (ns)					
			Maximum Delay			Minimum Delay		
Max	Min		66 MHz	83 MHz	100 MHz	66 MHz	83 MHz	100 MHz
sp36a	sp37a	FCC outputs—internal clock (NMSI)	6	5.5	5.5	0.5	0.5	0.5
sp36b	sp37b	FCC outputs—external clock (NMSI)	8	8	8	2	2	2
sp38a	sp39a	SCC/SMC/SPI/I2C outputs—internal clock (NMSI)	10	10	10	0	0	0
sp38b	sp39b	SCC/SMC/SPI/I2C outputs—external clock (NMSI)	8	8	8	2	2	2
sp40	sp41	TDM outputs/SI	11	11	11	2.5	2.5	2.5
sp42	sp43	TIMER/IDMA outputs	11	11	11	0.5	0.5	0.5
sp42a	sp43a	PIO outputs	11	11	11	0.5	0.5	0.5

1 Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.

Table 16. JTAG Timings[1] (continued)

Parameter	Symbol[2]	Min	Max	Unit	Notes
Input hold times Boundary-scan data TMS, TDI	 t_{JTDXKH} t_{JTIXKH}	 10 10	 — —	 ns ns	 4, 7 4, 7
Output valid times Boundary-scan data TDO	 t_{JTKLDV} t_{JTKLOV}	 — —	 10 10	 ns ns	 5, 7 5, 7
Output hold times Boundary-scan data TDO	 t_{JTKLDX} t_{JTKLOX}	 1 1	 — —	 ns ns	 5, 7 5, 7
JTAG external clock to output high impedance Boundary-scan data TDO	 t_{JTKLDZ} t_{JTKLOZ}	 1 1	 10 10	 ns ns	 5, 6 5, 6

1 All outputs are measured from the midpoint voltage of the falling/rising edge of t_{TCLK} to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50-Ω load. Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.

2 The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{JTDVKH} symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{JTG} clock reference (K) going to the high (H) state or setup time. Also, t_{JTDXKH} symbolizes JTAG timing (JT) with respect to the time data input signals (D) went invalid (X) relative to the t_{JTG} clock reference (K) going to the high (H) state. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

3 TRST is an asynchronous level sensitive signal. The setup time is for test purposes only.

4 Non-JTAG signal input timing with respect to t_{TCLK}.

5 Non-JTAG signal output timing with respect to t_{TCLK}.

6 Guaranteed by design.

7 Guaranteed by design and device characterization.

7 Clock Configuration Modes

This SoC includes the following clocking modes:

- Local
- PCI host
- PCI agent

The clocking mode is set according to the following input pins as shown in the following table:

- PCI_MODE
- PCI_CFG[0]
- PCI_MODCK

Table 17. SoC Clocking Modes

Pins			Clocking Mode	PCI Clock Frequency Range (MHZ)	Reference
PCI_MODE	PCI_CFG[0]	PCI_MODCK[1]			
1	—	—	Local bus	—	Table 18
0	0	0	PCI host	50–66	Table 19
0	0	1		25–50	Table 20
0	1	0	PCI agent	50–66	Table 21
0	1	1		25–50	Table 22

[1] Determines PCI clock frequency range. See Section 7.2, "PCI Host Mode," and Section 7.3, "PCI Agent Mode."

Within each mode, the configuration of bus, core, PCI, and CPM frequencies is determined by seven bits during the power-on reset—three hardware configuration pins (MODCK[1–3]) and four bits from hardware configuration word[28–31] (MODCK_H). Both the PLLs and the dividers are set according to the selected clock operation mode as described in the following sections.

7.1 Local Bus Mode

This table lists clock configurations for the SoC in local bus mode. The frequencies listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device.

NOTE

Clock configurations change only after $\overline{\text{PORESET}}$ is asserted.

Table 18. Clock Configurations for Local Bus Mode[1]

Mode[2]	Bus Clock[3] (MHz)		CPM Multiplication Factor[4]	CPM Clock (MHz)		CPU Multiplication Factor[5]	CPU Clock (MHz)	
MODCK_H-MODCK[1:3]	Low	High		Low	High		Low	High
Default Modes (MODCK_H= 0000)								
0000_000	37.5	133.3	3	112.5	400.0	4	150.0	533.3

Table 23. MPC8280 and MPC8270 (ZU and VV Packages) Pinout List (continued)

Pin Name		Ball
MPC8280/MPC8270	MPC8280 only	
Core power		U28, U29, K28, K29, A9, A19, B19, M1, M2, Y1, Y2, AC1, AC2, AH19, AJ19, AH10, AJ10, AJ5
Ground		AA5, AB1[6], AB2[7], AF21, AF14, AF8, AE7, AF11, AE17, AE23, AC26, AB25, Y26, V25, T26, R25, P26, M25, K27, H25, G26, D7, D10, D14, D16, D20, D23, C9, E11, E13, E15, E19, E22, B3, G5, H4, K5, M3, P5, T4, Y5, AA2, AC3

1 Should be tied to VDDH via a 2K Ω external pull-up resistor.

2 The default configuration of the CPM pins (PA[0–31], PB[4–31], PC[0–31], PD[4–31]) is input. To prevent excessive DC current, it is recommended to either pull unused pins to GND or VDDH, or to configure them as outputs.

3 Must be pulled down or left floating.

4 If PCI is not desired, must be pulled up or left floating.

5 Sphere is not connected to die.

6 GNDSYN (AB1): This pin exists as a separate ground signal in MPC826x(A) devices; it does not exist as a separate ground signal on the SoC. New designs must connect AB1 to GND and follow the suggestions in Section 4.6, "Layout Practices." Old designs in which the MPC8280 is used as a drop-in replacement can leave the pin connected to GND with the noise filtering capacitors.

7 XFC (AB2) pin: This pin is used in MPC826x(A) devices; it is not used in MPC8280 because there is no need for external capacitor to operate the PLL. New designs should connect AB2 (XFC) pin to GND. Old designs in which the SoC is used as a drop-in replacement can leave the pin connected to the current capacitor.

This table describes symbols used in Table 23.

Table 24. Symbol Legend

Symbol	Meaning
$\overline{\text{OVERBAR}}$	Signals with overbars, such as $\overline{\text{TA}}$, are active low.
UTM	Indicates that a signal is part of the UTOPIA master interface.
UTS	Indicates that a signal is part of the UTOPIA slave interface.
UT8	Indicates that a signal is part of the 8-bit UTOPIA interface.
UT16	Indicates that a signal is part of the 16-bit UTOPIA interface.
MII	Indicates that a signal is part of the media independent interface.
RMII	Indicates that a signal is part of the reduced media independent interface.

8.2 VR and ZQ Packages—MPC8275 and MPC8270

The following figures and table represent the alternate 516 PBGA package. For information on the standard package for the MPC8280 and the MPC8270, see Section 8.1, "ZU and VV Packages—MPC8280 and MPC8270.

1 Should be tied to VDDH via a 2K Ω external pull-up resistor.

2 The default configuration of the CPM pins (PA[0–31], PB[4–31], PC[0–31], PD[4–31]) is input. To prevent excessive DC current, it is recommended to either pull unused pins to GND or VDDH, or to configure them as outputs.

This figure provides the mechanical dimensions and bottom surface nomenclature of the 516 PBGA (VR/ZQ) packages.

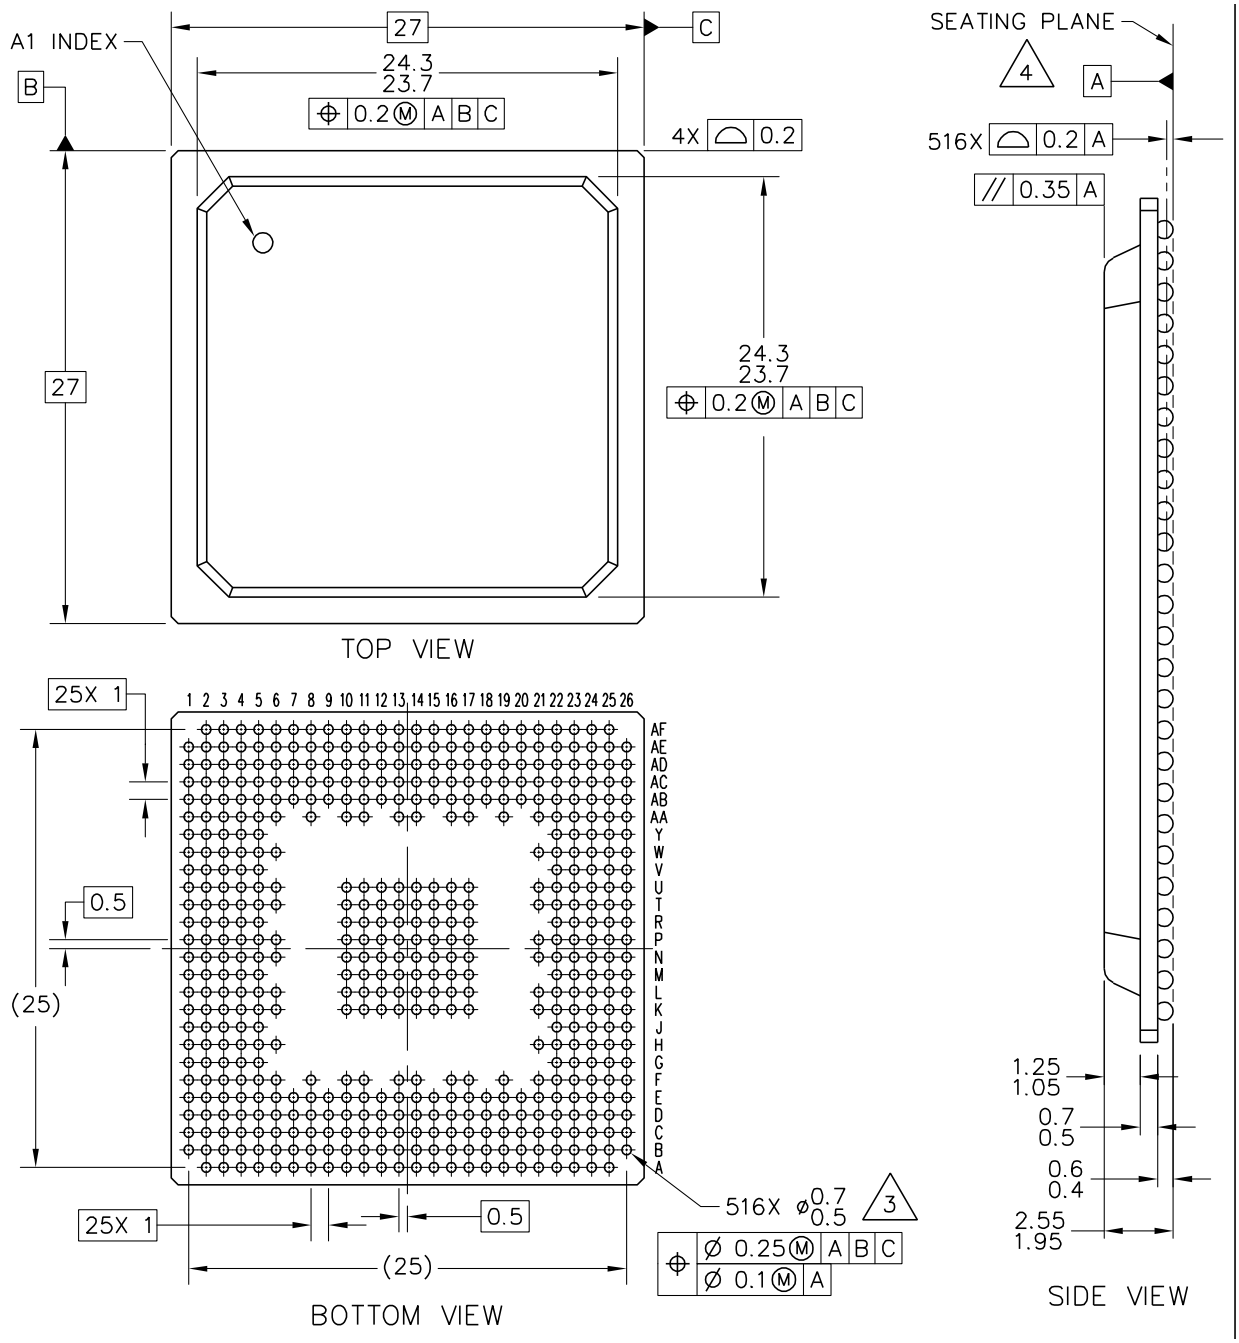

Figure 18. Mechanical Dimensions and Bottom Surface Nomenclature—516 PBGA

10 Ordering Information

This figure provides an example of the Freescale part numbering nomenclature for the SoC. In addition to the processor frequency, the part numbering scheme also consists of a part modifier that indicates any enhancement(s) in the part from the original production design. Each part number also contains a revision code that refers to the die mask revision number and is specified in the part numbering scheme for identification purposes only. For more information, contact your local Freescale sales office.

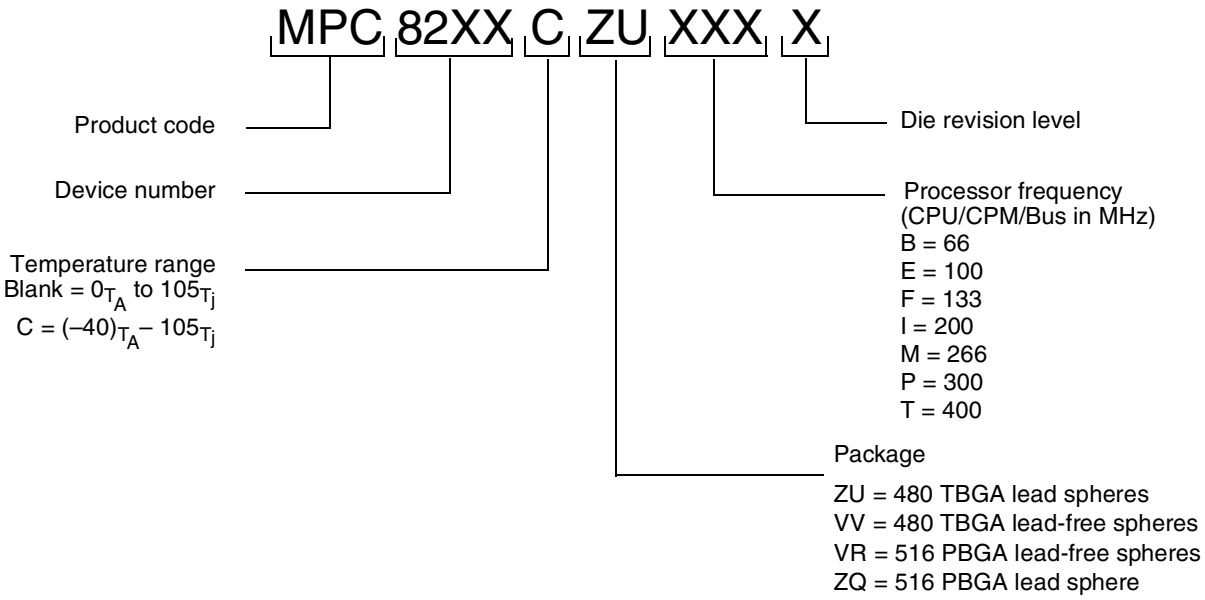

Figure 19. Freescale Part Number Key

11 Document Revision History

This table summarizes changes to this document.

Table 27. Document Revision History

Revision	Date	Substantive Changes
2	09/2011	In Figure 19, “Freescale Part Number Key,” added speed decoding information below processor frequency information.
1.8	07/2007	• Updated the entire document, adding information on the VV package.
1.7	12/2006	• Section 6, “AC Electrical Characteristics,” removed deratings statement and clarified AC timing descriptions.
1.6	05/2006	• Table 11: Added text to clarify that Data Bus Parity is not supported at 66 Mhz. • Table 11: Added text to clarify that Data Bus ECC is supported at 66 Mhz • Table 11: Added note to DP pins to show it is not supported at 66 MHz • Table 12: Added note to support 1 ns hold time
1.5	03/2006	• Added Section 6.3, “JTAG Timings”

Table 27. Document Revision History (continued)

Revision	Date	Substantive Changes
1.4	11/2005	• In Section 6.2, "SIU AC Characteristics", modified the note on CLKIN Jitter and Duty Cycle. • Modified Figure 17 to display all text.
1.3	01/2005	• Modification for correct display of assertion level ("overbar") for some signals
1.2	12/2004	• Section 2: removed voltage tracking note • Table 3: Note 2 updated regarding VDD/VCCSYN relationship to VDDH during power-on reset • Table 5: Note 2 updated to reflect VIH=2.5 for TCK, TRST, PORESET; request for external pullup removed. • Table 5: Note 4 added regarding IIC compatibility • Section 4.2: New information about jumper-to-case thermal resistance • Section 4.3: New information about jumper-to-board thermal resistance • Section 4.4: New information about estimation with simulation • Section 4.6: Updated description of layout practices • Section 6: Added sentence providing derating factor • Section 6.1, "CPM AC Characteristics": added Note: Rise/Fall Time on CPM Input Pins • Table 9: updated values for following specs: sp42, sp43, sp42a • Table 20: updated values for following specs: sp16b, sp18b, sp20, sp22 • Section 6.2: added spread sprectrum clocking note • Table 11: combined specs sp11 and sp11a • Sections 7.2, 7.3: unit of ns added to Tval notes • Section 7, "Clock Configuration Modes": Updated all table footnotes reflect updated CPU Fmin of 150 MHz commercial temp devices, 175 MHz extended temp; CPM Fmin of 120 MHz.

Table 27. Document Revision History (continued)

Revision	Date	Substantive Changes
0.3	6/2003	• Removal of notes stating “no local bus” on VR-package devices. The MPC8270VR and the MPC8275VR have local bus support. • References to “G2 core” changed to “G2_LE core.” See the *G2 Core Reference Manual* (G2CORERM/D). • Addition of VCCSYN to “Note” below Table 4, and to note 3 of Table 5 • Figure 2: New • Table 5: Addition of note 1 • Table 10: Addition of θ_{JB} and θ_{JC}. Modifications to ZU package values. • Table 12: Addition of various configurations, Modification of values. Addition of note 3. • Table 9: Addition of 66 MHZ and 100 MHz values. Addition of sp42a/sp43a. • Table 20: Addition of 66 MHZ and 100 MHz values • Table 12: sp30 values. sp33b @100 MHz value. Removal of previous note 2. Modification of current note 2. • Figure 5, Figure 6, Figure 7, and Figure 8: Addition of notes • Section 6.2: Addition of note on PCI timing • Table 18, Table 32, Table 33, Table 36, Table 37: Addition of note 1 concerning minimum operating frequencies • Addition of statement before clock tables about selection of clock configuration and input frequency • Table 23 and Table 25: Addition of note 1 to CPM pins
0.2	11/2002	Table 25, “VR Pinout”: Addition of C18 to the Ground (GND) pin list (page 63)
