What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

REGISTER 21-1: RTCCON: RTC CONTROL REGISTER (CONTINUED)

bit 3 **RTCWREN:** RTC Value Registers Write Enable bit(4)
- 1 = RTC Value registers can be written to by the user
- 0 = RTC Value registers are locked out from being written to by the user

bit 2 **RTCSYNC:** RTCC Value Registers Read Synchronization bit
- 1 = RTC Value registers can change while reading, due to a rollover ripple that results in an invalid data read If the register is read twice and results in the same data, the data can be assumed to be valid
- 0 = RTC Value registers can be read without concern about a rollover ripple

bit 1 **HALFSEC:** Half-Second Status bit(5)
- 1 = Second half period of a second
- 0 = First half period of a second

bit 0 **RTCOE:** RTCC Output Enable bit
- 1 = RTCC clock output enabled – clock presented onto an I/O
- 0 = RTCC clock output disabled

Note 1: The ON bit is only writable when RTCWREN = 1.

2: When using the 1:1 PBCLK divisor, the user software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

3: Requires RTCOE = 1 (RTCCON<0>) for the output to be active.

4: The RTCWREN bit can be set only when the write sequence is enabled.

5: This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).

Note: This register is reset only on a Power-on Reset (POR).

24.0 COMPARATOR

Note: This data sheet summarizes the features of the PIC32MX1XX/2XX/5XX 64/100-pin family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. "Comparator"** (DS60001110) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

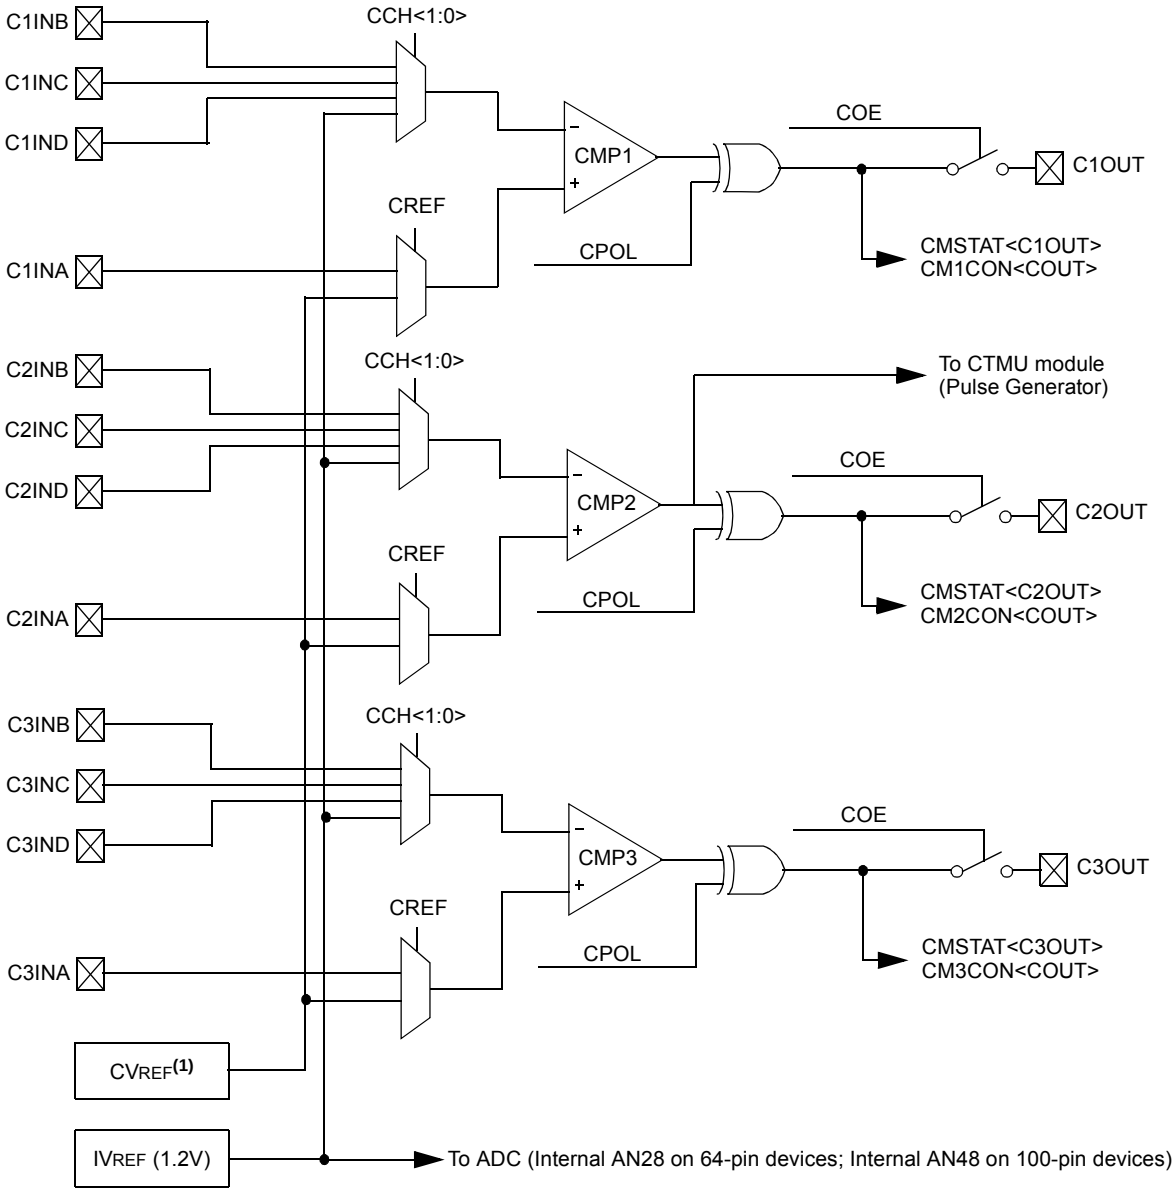
The Analog Comparator module contains three comparators that can be configured in a variety of ways.

The following are the key features of this module:

- Selectable inputs available include:
  - Analog inputs multiplexed with I/O pins
  - On-chip internal absolute voltage reference (IVREF)
  - Comparator voltage reference (CVREF)
- Outputs can be inverted
- Selectable interrupt generation

A block diagram of the comparator module is provided in Figure 24-1.

FIGURE 24-1: COMPARATOR BLOCK DIAGRAM



Note 1: Internally connected. See **Section 25.0 "Comparator Voltage Reference (CVREF)"** for more information.

bit 25 **EDG2STAT:** Edge 2 Status bit

1 = Edge 2 has occurred
0 = Edge 2 has not occurred

Note 1: When this bit is set for Pulse Delay Generation, the EDG2SEL<3:0> bits must be set to '1110' to select C2OUT.

2: The ADC module Sample and Hold capacitor is not automatically discharged between sample/conversion cycles. Software using the ADC as part of a capacitive measurement, must discharge the ADC capacitor before conducting the measurement. The IDISSEN bit, when set to '1', performs this function. The ADC module must be sampling while the IDISSEN bit is active to connect the discharge sink to the capacitor array.

3: Refer to the CTMU Current Source Specifications (Table 31-41) in **Section 31.0 "40 MHz Electrical Characteristics"** for current values.

4: This bit setting is not available for the CTMU temperature diode.
