

Welcome to [E-XFL.COM](#)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Active
Core Processor	MIPS32® M4K™
Core Size	32-Bit Single-Core
Speed	40MHz
Connectivity	CANbus, I²C, IrDA, LINbus, PMP, SPI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	49
Program Memory Size	128KB (128K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 3.6V
Data Converters	A/D 28x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-VFQFN Exposed Pad
Supplier Device Package	64-QFN (9x9)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mx530f128ht-i-mr

PIC32MX1XX/2XX/5XX 64/100-PIN FAMILY

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

Pin Name	Pin Number		Pin Type	Buffer Type	Description
	64-pin QFN/ TQFP	100-pin TQFP			
MCLR	7	13	I	ST	Master Clear (Reset) input. This pin is an active-low Reset to the device.
AVDD	19	30	P	P	Positive supply for analog modules. This pin must be connected at all times.
AVss	20	31	P	P	Ground reference for analog modules
VDD	10, 26, 38, 57	2, 16, 37, 46, 62, 86	P	—	Positive supply for peripheral logic and I/O pins
VCAP	56	85	P	—	Capacitor for Internal Voltage Regulator
VSS	9, 25, 41	15, 36, 45, 65, 75	P	—	Ground reference for logic and I/O pins
VREF+	16	29	P	Analog	Analog Voltage Reference (High) Input
VREF-	15	28	P	Analog	Analog Voltage Reference (Low) Input

Legend: CMOS = CMOS compatible input or output Analog = Analog input I = Input O = Output
 ST = Schmitt Trigger input with CMOS levels TTL = TTL input buffer P = Power

- Note 1:** This pin is only available on devices without a USB module.
2: This pin is only available on devices with a USB module.
3: This pin is not available on 64-pin devices with a USB module.
4: This pin is only available on 100-pin devices without a USB module.

2.0 GUIDELINES FOR GETTING STARTED WITH 32-BIT MCUS

Note: This data sheet summarizes the features of the PIC32MX1XX/2XX/5XX 64/100-pin family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the "PIC32 Family Reference Manual", which is available from the Microchip web site (www.microchip.com/PIC32).

2.1 Basic Connection Requirements

Getting started with the PIC32MX1XX/2XX/5XX 64/100-pin family of 32-bit Microcontrollers (MCUs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and Vss pins (see **2.2 "Decoupling Capacitors"**)
- All AVDD and AVss pins, even if the ADC module is not used (see **2.2 "Decoupling Capacitors"**)
- VCAP pin (see **2.3 "Capacitor on Internal Voltage Regulator (VCAP)"**)
- MCLR pin (see **2.4 "Master Clear (MCLR) Pin"**)
- PGECx/PGEDx pins, used for In-Circuit Serial Programming (ICSP™) and debugging purposes (see **2.5 "ICSP Pins"**)
- OSC1 and OSC2 pins, when external oscillator source is used (see **2.7 "External Oscillator Pins"**)

The following pins may be required:

VREF+/VREF- pins, used when external voltage reference for the ADC module is implemented.

Note: The AVDD and AVss pins must be connected, regardless of ADC use and the ADC voltage reference source.

2.2 Decoupling Capacitors

The use of decoupling capacitors on power supply pins, such as VDD, Vss, AVDD and AVss is required. See Figure 2-1.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A value of 0.1 μ F (100 nF), 10-20V is recommended. The capacitor should be a low Equivalent Series Resistance (low-ESR) capacitor and have resonance frequency in the range of 20 MHz and higher. It is further recommended that ceramic capacitors be used.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended that the capacitors be placed on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high frequency noise:** If the board is experiencing high frequency noise, upward of tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 μ F to 0.001 μ F. Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 μ F in parallel with 0.001 μ F.
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum thereby reducing PCB track inductance.

3.0 CPU

Note: This data sheet summarizes the features of the PIC32MX1XX/2XX/5XX 64/100-pin family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 2. "CPU"** (DS60001113) in the "*PIC32 Family Reference Manual*", which is available from the Microchip web site (www.microchip.com/PIC32). Resources for the MIPS32® M4K® Processor Core are available at <http://www.imgtec.com>.

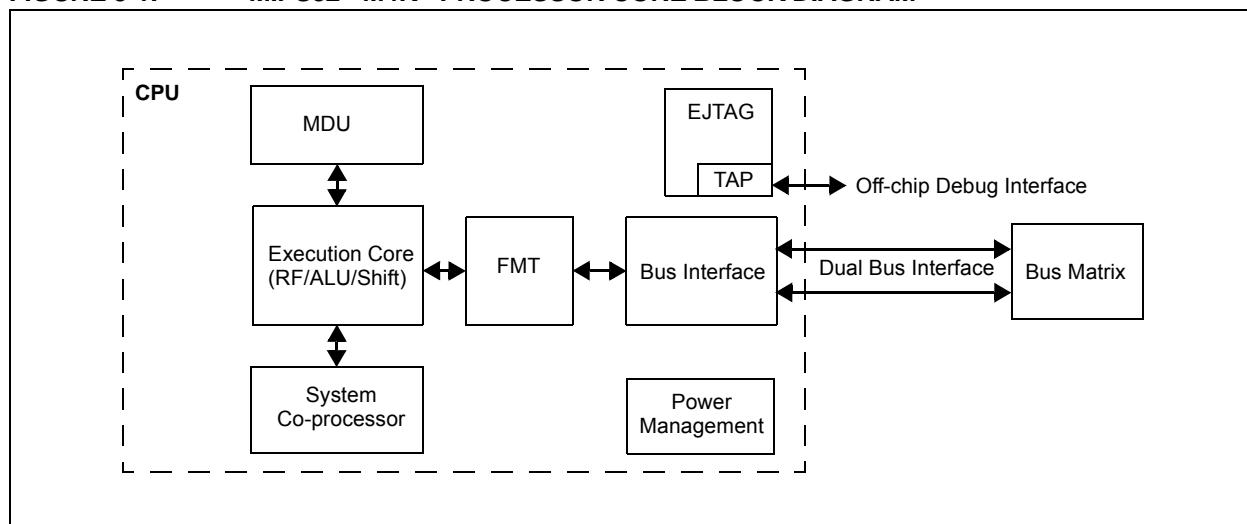

The the MIPS32® M4K® Processor Core is the heart of the PIC32MX1XX/2XX/5XX 64/100-pin device processor. The CPU fetches instructions, decodes each instruction, fetches source operands, executes each instruction and writes the results of instruction execution to the proper destinations.

3.1 Features

- 5-stage pipeline
- 32-bit address and data paths
- MIPS32® Enhanced Architecture (Release 2):
 - Multiply-accumulate and multiply-subtract instructions
 - Targeted multiply instruction
 - Zero/One detect instructions
 - WAIT instruction
 - Conditional move instructions (MOVN, MOVZ)
 - Vectored interrupts
 - Programmable exception vector base
 - Atomic interrupt enable/disable
 - Bit field manipulation instructions

- MIPS16e® Code Compression:
 - 16-bit encoding of 32-bit instructions to improve code density
 - Special PC-relative instructions for efficient loading of addresses and constants
 - SAVE and RESTORE macro instructions for setting up and tearing down stack frames within subroutines
 - Improved support for handling 8 and 16-bit data types
- Simple Fixed Mapping Translation (FMT) Mechanism:
- Simple Dual Bus Interface:
 - Independent 32-bit address and data buses
 - Transactions can be aborted to improve interrupt latency
- Autonomous Multiply/Divide Unit (MDU):
 - Maximum issue rate of one 32x16 multiply per clock
 - Maximum issue rate of one 32x32 multiply every other clock
 - Early-in iterative divide. Minimum 11 and maximum 33 clock latency (dividend (*rs*) sign extension-dependent)
- Power Control:
 - Minimum frequency: 0 MHz
 - Low-Power mode (triggered by WAIT instruction)
 - Extensive use of local gated clocks
- EJTAG Debug:
 - Support for single stepping
 - Virtual instruction and data address/value
 - Breakpoints

	DCRCRDATA<15:8>							
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	DCRCRDATA<7:0>							

Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared
		x = Bit is unknown

bit 31:0 DCRCRDATA<31:0>: CRC Data Register bits

Writing to this register will seed the CRC generator. Reading from this register will return the current value of the CRC. Bits greater than PLEN will return '0' on any read.

When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):

Only the lower 16 bits contain IP header checksum information. The upper 16 bits are always '0'. Data written to this register is converted and read back in 1's complement form (i.e., current IP header checksum value).

When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):

Bits greater than PLEN will return '0' on any read.

REGISTER 9-6: DCRCXOR: DMA CRCXOR ENABLE REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	CSF<1:0> ⁽²⁾		ALP ⁽²⁾	CS2P ⁽²⁾	CS1P ⁽²⁾	—	WRSP	RDSP

Legend:

HC = Hardware cleared

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23 **RDSTART:** Start a Read on the PMP Bus bit⁽³⁾

1 = Start a read cycle on the PMP bus

0 = No effect

This bit is cleared by hardware at the end of the read cycle when the BUSY bit (PMMODE<15>) = 0.

bit 22-18 **Unimplemented:** Read as '0'

bit 17 **DUALBUF:** Parallel Master Port Dual Read/Write Buffer Enable bit

This bit is only valid in Master mode.

1 = PMP uses separate registers for reads and writes

Reads: PMRADDR and PMRDIN

Writes: PMRWADDR and PMDOUT

0 = PMP uses legacy registers for reads and writes

Reads/Writes: PMADDR and PMRDIN

bit 16 **Unimplemented:** Read as '0'

bit 15 **ON:** Parallel Master Port Enable bit⁽¹⁾

1 = PMP enabled

0 = PMP disabled, no off-chip access performed

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit

1 = Discontinue module operation when device enters Idle mode

0 = Continue module operation in Idle mode

bit 12-11 **ADRMUX<1:0>:** Address/Data Multiplexing Selection bits

11 = Lower 8 bits of address are multiplexed on PMD<15:0> pins

10 = All 16 bits of address are multiplexed on PMD<7:0> pins

01 = Lower 8 bits of address are multiplexed on PMD<7:0> pins, upper bits are on PMA<15:8>

00 = Address and data appear on separate pins

bit 10 **PMPTTL:** PMP Module TTL Input Buffer Select bit

1 = PMP module uses TTL input buffers

0 = PMP module uses Schmitt Trigger input buffer

bit 9 **PTWREN:** Write Enable Strobe Port Enable bit

1 = PMWR/PMENB port enabled

0 = PMWR/PMENB port disabled

Note 1: When using 1:1 PBCLK divisor, the user software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON control bit.

2: These bits have no effect when their corresponding pins are used as address lines.

PIC32MX1XX/2XX/5XX 64/100-PIN FAMILY

REGISTER 20-2: PMODE: PARALLEL PORT MODE REGISTER (CONTINUED)

bit 5-2 **WAITM<3:0>**: Data Read/Write Strobe Wait States bits⁽¹⁾

1111 = Wait of 16 TPB

.

.

.

0001 = Wait of 2 TPB

0000 = Wait of 1 TPB (default)

bit 1-0 **WAITE<1:0>**: Data Hold After Read/Write Strobe Wait States bits⁽¹⁾

11 = Wait of 4 TPB

10 = Wait of 3 TPB

01 = Wait of 2 TPB

00 = Wait of 1 TPB (default)

For Read operations:

11 = Wait of 3 TPB

10 = Wait of 2 TPB

01 = Wait of 1 TPB

00 = Wait of 0 TPB (default)

Note 1: Whenever WAITM<3:0> = 0000, WAITB and WAITE bits are ignored and forced to 1 TPBCLK cycle for a write operation; WAITB = 1 TPBCLK cycle, WAITE = 0 TPBCLK cycles for a read operation.

2: Address bits, A15 and A14, are not subject to automatic increment/decrement if configured as Chip Select CS2 and CS1.

3: These pins are active when MODE16 = 1 (16-bit mode).

TABLE 31-6: DC CHARACTERISTICS: IDLE CURRENT (I_{IDLE})

DC CHARACTERISTICS			Standard Operating Conditions: 2.3V to 3.6V (unless otherwise stated)			
Parameter No.	Typical ⁽²⁾	Max.	Units	Conditions		
Idle Current (I_{IDLE}): Core Off, Clock on Base Current (Notes 1, 4)						
DC30a	1.5	5	mA	4 MHz (Note 3)		
DC31a	3	8	mA	10 MHz		
DC32a	5	12	mA	20 MHz (Note 3)		
DC33a	6.5	15	mA	30 MHz (Note 3)		
DC34a	8	20	mA	40 MHz		
DC37a	75	100	µA	-40°C	3.3V	LPRC (31 kHz) (Note 3)
DC37b	180	250	µA	+25°C		
DC37c	280	380	µA	+85°C		

Note 1: The test conditions for I_{IDLE} current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
 - OSC2/CLKO is configured as an I/O input pin
 - USB PLL oscillator is disabled if the USB module is implemented, PBCLK divisor = 1:8
 - CPU is in Idle mode (CPU core Halted), and SRAM data memory Wait states = 1
 - No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared
 - WDT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
 - All I/O pins are configured as inputs and pulled to V_{SS}
 - MCLR = V_{DD}
 - RTCC and JTAG are disabled
- 2:** Data in the “Typical” column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
- 3:** This parameter is characterized, but not tested in manufacturing.
- 4:** I_{IDLE} electrical characteristics for devices with 256 KB Flash are only provided as Preliminary information.

			400 kHz mode	TPB * (BRG + 2)	—	μs
			1 MHz mode (Note 2)	TPB * (BRG + 2)	—	μs
IM31	THD:STA	Start Condition Hold Time	100 kHz mode	TPB * (BRG + 2)	—	μs
			400 kHz mode	TPB * (BRG + 2)	—	μs
			1 MHz mode (Note 2)	TPB * (BRG + 2)	—	μs
IM33	TSU:STO	Stop Condition Setup Time	100 kHz mode	TPB * (BRG + 2)	—	μs
			400 kHz mode	TPB * (BRG + 2)	—	μs
			1 MHz mode (Note 2)	TPB * (BRG + 2)	—	μs
IM34	THD:STO	Stop Condition Hold Time	100 kHz mode	TPB * (BRG + 2)	—	ns
			400 kHz mode	TPB * (BRG + 2)	—	ns
			1 MHz mode (Note 2)	TPB * (BRG + 2)	—	ns

Note 1: BRG is the value of the I²C Baud Rate Generator.

2: Maximum pin capacitance = 10 pF for all I²Cx pins (for 1 MHz mode only).

3: The typical value for this parameter is 104 ns.

PIC32MX1XX/2XX/5XX 64/100-PIN FAMILY

32.1 DC Characteristics

TABLE 32-1: OPERATING MIPS VS. VOLTAGE

Characteristic	VDD Range (in Volts) ⁽¹⁾	Temp. Range (in °C)	Max. Frequency
			PIC32MX1XX/2XX/5XX 64/100-pin Family
MDC5	V _{BOR} -3.6V	-40°C to +85°C	50 MHz

Note 1: Overall functional device operation at $V_{BORMIN} < VDD < VDDMIN$ is tested, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below $VDDMIN$. Refer to parameter BO10 in Table 31-10 for BOR values.

TABLE 32-2: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

DC CHARACTERISTICS		Standard Operating Conditions: 2.3V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial		
Parameter No.	Typical ⁽³⁾	Max.	Units	Conditions
Operating Current (IDD) (Note 1, 2)				
MDC24	25	40	mA	50 MHz

Note 1: A device's IDD supply current is mainly a function of the operating voltage and frequency. Other factors, such as PBCLK (Peripheral Bus Clock) frequency, number of peripheral modules enabled, internal code execution pattern, execution from Program Flash memory vs. SRAM, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.

2: The test conditions for IDD measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL oscillator is disabled if the USB module is implemented, PBCLK divisor = 1:8
- CPU, Program Flash, and SRAM data memory are operational, SRAM data memory Wait states = 1
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared
- WDT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to V_{SS}
- MCLR = V_{DD}
- CPU executing while(1) statement from Flash

3: RTCC and JTAG are disabled

4: Data in "Typical" column is at 3.3V, 25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.

33.0 DC AND AC DEVICE CHARACTERISTICS GRAPHS

Note: The graphs provided following this note are a statistical summary based on a limited number of samples and are provided for design guidance purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore, outside the warranted range.
