What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

bit 7	TXEN: TX/RX Buffer Selection bit 1 = FIFO is a Transmit FIFO 0 = FIFO is a Receive FIFO
bit 6	TXABAT: Message Aborted bit ⁽²⁾ 1 = Message was aborted 0 = Message completed successfully
bit 5	TXLARB: Message Lost Arbitration bit ⁽³⁾ 1 = Message lost arbitration while being sent 0 = Message did not lose arbitration while being sent

bit 3	TXREQ: Message Send Request <u>TXEN = 1:</u> (FIFO configured as a Transmit FIFO) Setting this bit to '1' requests sending a message. The bit will automatically clear when all the messages queued in the FIFO are successfully sent. Clearing the bit to '0' while set ('1') will request a message abort. <u>TXEN = 0:</u> (FIFO configured as a receive FIFO) This bit has no effect.
bit 2	RTREN: Auto RTR Enable bit 1 = When a remote transmit is received, TXREQ will be set 0 = When a remote transmit is received, TXREQ will be unaffected
bit 1-0	TXPR<1:0>: Message Transmit Priority bits 11 = Highest message priority 10 = High intermediate message priority 01 = Low intermediate message priority 00 = Lowest message priority

Note 1: These bits can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> bits (C1CON<23:21>) = 100).

2: This bit is updated when a message completes (or aborts) or when the FIFO is reset.

3: This bit is reset on any read of this register or when the FIFO is reset.
