

Welcome to [E-XFL.COM](#)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Details

Product Status	Active
Core Processor	MIPS32® M4K™
Core Size	32-Bit Single-Core
Speed	40MHz
Connectivity	CANbus, I²C, IrDA, LINbus, PMP, SPI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	81
Program Memory Size	512KB (512K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	64K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 3.6V
Data Converters	A/D 48x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (14x14)

2.7.1 CRYSTAL OSCILLATOR DESIGN CONSIDERATION

The following examples are used to calculate the Primary Oscillator loading capacitor values:

- $C_{IN} = \text{PIC32_OSC2_Pin Capacitance} = \sim 4.5 \text{ pF}$
- $C_{OUT} = \text{PIC32_OSC1_Pin Capacitance} = \sim 4.5 \text{ pF}$
- C_1 and C_2 = XTAL manufacturing recommended loading capacitance
- Estimated PCB stray capacitance, (i.e., 12 mm length) = 2.5 pF

EXAMPLE 2-1: CRYSTAL LOAD CAPACITOR CALCULATION

Crystal manufacturer recommended: $C_1 = C_2 = 15 \text{ pF}$

Therefore:

$$\begin{aligned} C_{LOAD} &= \left\{ \left[(C_{IN} + C_1) * (C_{OUT} + C_2) \right] / [C_{IN} + C_1 + C_2 + C_{OUT}] \right\} \\ &\quad + \text{estimated oscillator PCB stray capacitance} \\ &= \left\{ \left[(5 + 15)[5 + 15] \right] / [5 + 15 + 15 + 5] \right\} + 2.5 \text{ pF} \\ &= \left\{ (20)[20] / [40] \right\} + 2.5 \\ &= 10 + 2.5 = 12.5 \text{ pF} \end{aligned}$$

Rounded to the nearest standard value or 13 pF in this example for Primary Oscillator crystals "C1" and "C2".

The following tips are used to increase oscillator gain, (i.e., to increase peak-to-peak oscillator signal):

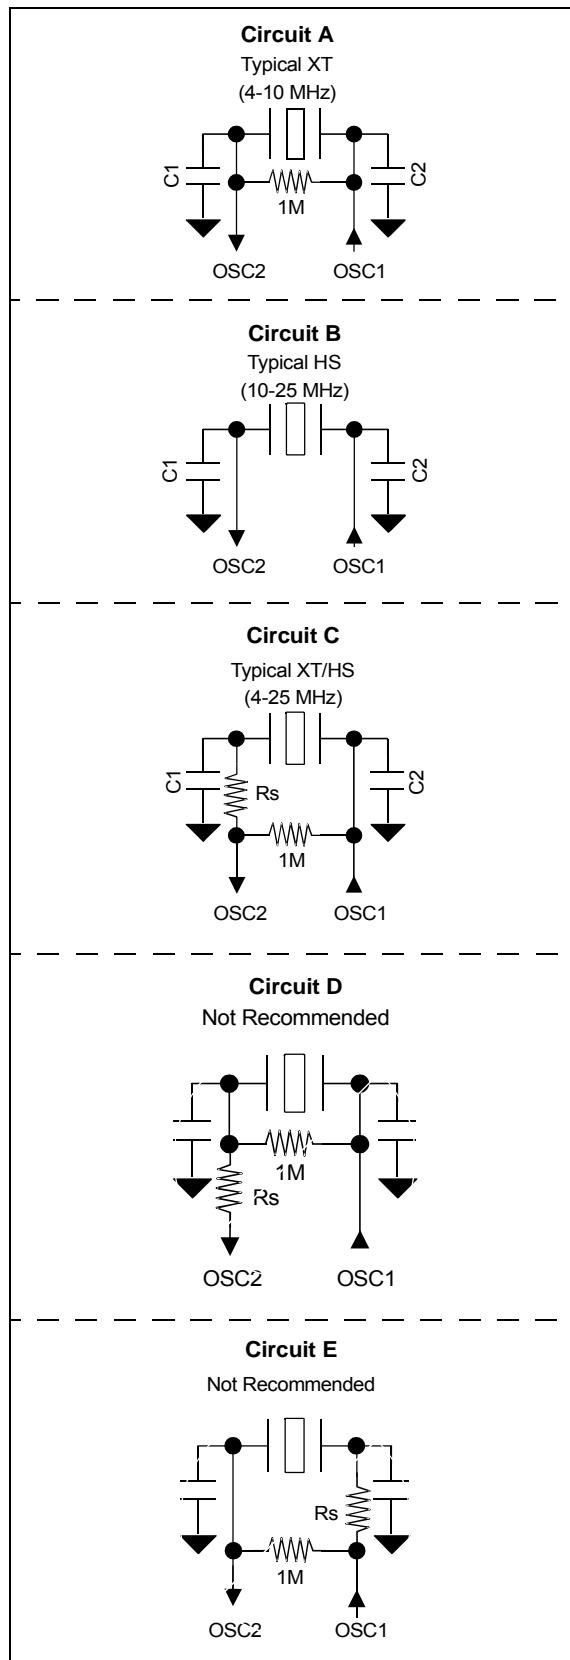

- Select a crystal with a lower "minimum" power drive rating
- Select an crystal oscillator with a lower XTAL manufacturing "ESR" rating.
- Add a parallel resistor across the crystal. The smaller the resistor value the greater the gain. It is recommended to stay in the range of 600k to 1M
- C_1 and C_2 values also affect the gain of the oscillator. The lower the values, the higher the gain.
- C_2/C_1 ratio also affects gain. To increase the gain, make C_1 slightly smaller than C_2 , which will also help start-up performance.

Note: Do not add excessive gain such that the oscillator signal is clipped, flat on top of the sine wave. If so, you need to reduce the gain or add a series resistor, Rs , as shown in circuit "C" in Figure 2-4. Failure to do so will stress and age the crystal, which can result in an early failure. Adjust the gain to trim the max peak-to-peak to $\sim V_{DD} - 0.6V$. When measuring the oscillator signal you must use a FET scope probe or a probe with $\leq 1.5 \text{ pF}$ or the scope probe itself will unduly change the gain and peak-to-peak levels.

REGISTER 22-1: AD1CON1: ADC CONTROL REGISTER 1 (CONTINUED)

bit 4	CLRASAM: Stop Conversion Sequence bit (when the first ADC interrupt is generated) 1 = Stop conversions when the first ADC interrupt is generated. Hardware clears the ASAM bit when the ADC interrupt is generated. 0 = Normal operation, buffer contents will be overwritten by the next conversion sequence
bit 3	Unimplemented: Read as '0'
bit 2	ASAM: ADC Sample Auto-Start bit 1 = Sampling begins immediately after last conversion completes; SAMP bit is automatically set. 0 = Sampling begins when SAMP bit is set
bit 1	SAMP: ADC Sample Enable bit ⁽²⁾ 1 = The ADC sample and hold amplifier is sampling 0 = The ADC sample/hold amplifier is holding When ASAM = 0, writing '1' to this bit starts sampling. When SSRC = 000, writing '0' to this bit will end sampling and start conversion.
bit 0	DONE: Analog-to-Digital Conversion Status bit ⁽³⁾ 1 = Analog-to-digital conversion is done 0 = Analog-to-digital conversion is not done or has not started Clearing this bit will not affect any operation in progress.

- Note 1:** When using 1:1 PBCLK divisor, the user software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.
- 2:** If ASAM = 0, software can write a '1' to start sampling. This bit is automatically set by hardware if ASAM = 1. If SSRC = 0, software can write a '0' to end sampling and start conversion. If SSRC ≠ 0, this bit is automatically cleared by hardware to end sampling and start conversion.
- 3:** This bit is automatically set by hardware when analog-to-digital conversion is complete. Software can write a '0' to clear this bit (a write of '1' is not allowed). Clearing this bit does not affect any operation already in progress. This bit is automatically cleared by hardware at the start of a new conversion.

23.0 CONTROLLER AREA NETWORK (CAN)

Note: This data sheet summarizes the features of the PIC32MX1XX/2XX/5XX 64/100-pin family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 34. "Controller Area Network (CAN)"** (DS60001154) in the "*PIC32 Family Reference Manual*", which is available from the Microchip web site (www.microchip.com/PIC32).

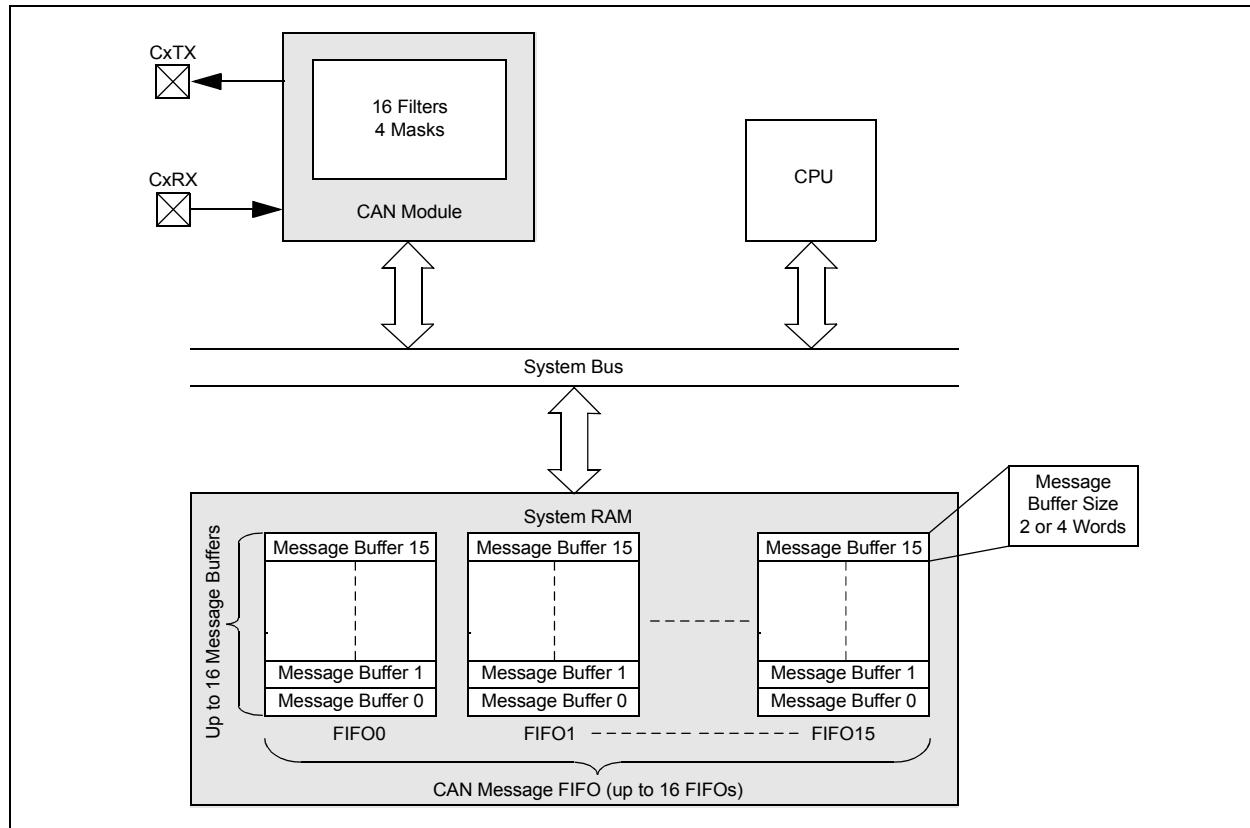

The Controller Area Network (CAN) module supports the following key features:

- Standards Compliance:
 - Full CAN 2.0B compliance
 - Programmable bit rate up to 1 Mbps
- Message Reception and Transmission:
 - 16 message FIFOs
 - Each FIFO can have up to 16 messages for a total of 256 messages

- FIFO can be a transmit message FIFO or a receive message FIFO
- User-defined priority levels for message FIFOs used for transmission
- 16 acceptance filters for message filtering
- Four acceptance filter mask registers for message filtering
- Automatic response to remote transmit request
- DeviceNet™ addressing support
- Additional Features:
 - Loopback, Listen All Messages, and Listen Only modes for self-test, system diagnostics and bus monitoring
 - Low-power operating modes
 - CAN module is a bus master on the PIC32 system bus
 - Use of DMA is not required
 - Dedicated time-stamp timer
 - Dedicated DMA channels
 - Data-only Message Reception mode

Figure 23-1 illustrates the general structure of the CAN module.

bit 31-0 **C1FIFOAn<31:0>: CAN FIFO User Address bits**

TXEN = 1: (FIFO configured as a transmit buffer)

A read of this register will return the address where the next message is to be written (FIFO head).

TXEN = 0: (FIFO configured as a receive buffer)

A read of this register will return the address where the next message is to be read (FIFO tail).

Note 1: This bit will always read ‘0’, which forces byte-alignment of messages.

Note: This register is not guaranteed to read correctly in Configuration mode, and should only be accessed when the module is not in Configuration mode.
