Microchip Technology - DSPIC33FJ12MC201-I/SO Datasheet

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

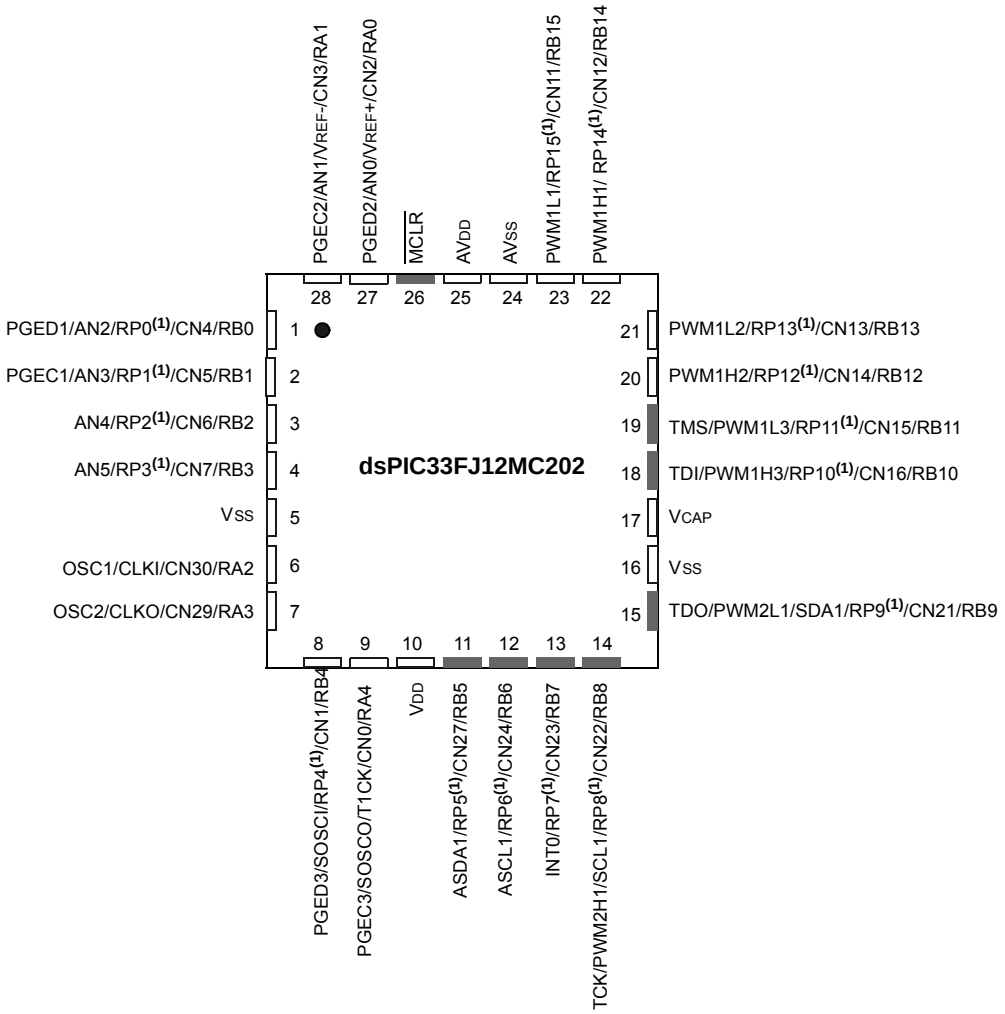
Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	40 MIPs
Connectivity	I²C, IrDA, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, Motor Control PWM, QEI, POR, PWM, WDT
Number of I/O	15
Program Memory Size	12KB (12K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 4x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SOIC (0.295", 7.50mm Width)
Supplier Device Package	20-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33fj12mc201-i-so

Pin Diagrams (Continued)

28-Pin QFN(2)

■ = Pins are up to 5V tolerant



Note 1: The RPn pins can be used by any remappable peripheral. See Table 1 for the list of available peripherals.

2: The metal plane at the bottom of the device is not connected to any pins and is recommended to be connected to VSS externally.

NOTES:

TABLE 4-15: ADC1 REGISTER MAP FOR dsPIC33FJ12MC202

6.0 RESETS

Note 1: This data sheet summarizes the features of the dsPIC33FJ12MC201/202 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 8. "Reset"** (DS70192) of the *"dsPIC33F/PIC24H Family Reference Manual"*, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The Reset module combines all Reset sources and controls the device Master Reset Signal, $\overline{\text{SYSRST}}$. The following is a list of device Reset sources:

- POR: Power-on Reset
- BOR: Brown-out Reset
- $\overline{\text{MCLR}}$: Master Clear Pin Reset
- SWR: RESET Instruction
- WDTO: Watchdog Timer Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Condition Device Reset
  - Illegal Opcode Reset
  - Uninitialized W Register Reset
  - Security Reset

A simplified block diagram of the Reset module is shown in Figure 6-1.

Any active source of Reset will make the $\overline{\text{SYSRST}}$ signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state, and some are unaffected.

Note: Refer to the specific peripheral section or **Section 3.0 "CPU"** of this manual for register Reset states.

All types of device Reset set a corresponding status bit in the RCON register to indicate the type of Reset (see Register 6-1).

All bits that are set, with the exception of the POR bit (RCON<0>), are cleared during a POR event. The user application can set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this data sheet.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset is meaningful.

8.1 CPU Clocking System

The dsPIC33FJ12MC201/202 devices provide seven system clock options:

- Fast RC (FRC) Oscillator
- FRC Oscillator with PLL
- Primary (XT, HS or EC) Oscillator
- Primary Oscillator with PLL
- Secondary (LP) Oscillator
- Low-Power RC (LPRC) Oscillator
- FRC Oscillator with postscaler

8.1.1 SYSTEM CLOCK SOURCES

8.1.1.1 Fast RC

The Fast RC (FRC) internal oscillator runs at a nominal frequency of 7.37 MHz. User software can tune the FRC frequency. User software can optionally specify a factor (ranging from 1:2 to 1:256) by which the FRC clock frequency is divided. This factor is selected using the FRCDIV<2:0> (CLKDIV<10:8>) bits.

8.1.1.2 Primary

The primary oscillator can use one of the following as its clock source:

- XT (Crystal): Crystals and ceramic resonators in the range of 3 MHz to 10 MHz. The crystal is connected to the OSC1 and OSC2 pins.
- HS (High-Speed Crystal): Crystals in the range of 10 MHz to 40 MHz. The crystal is connected to the OSC1 and OSC2 pins.
- EC (External Clock): The external clock signal is directly applied to the OSC1 pin.

8.1.1.3 Secondary

The secondary (LP) oscillator is designed for low power and uses a 32.768 kHz crystal or ceramic resonator. The LP oscillator uses the SOSCI and SOSCO pins.

8.1.1.4 Low-Power RC

The Low-Power RC (LPRC) internal oscIllator runs at a nominal frequency of 32.768 kHz. It is also used as a reference clock by the Watchdog Timer (WDT) and Fail-Safe Clock Monitor (FSCM).

8.1.1.5 FRC

The clock signals generated by the FRC and primary oscillators can be optionally applied to an on-chip Phase-Locked Loop (PLL) to provide a wide range of output frequencies for device operation. PLL configuration is described in **Section 8.1.3 "PLL Configuration"**.

The FRC frequency depends on the FRC accuracy (see Table 24-18) and the value of the FRC Oscillator Tuning register (see Register 8-4).

8.1.2 SYSTEM CLOCK SELECTION

The oscillator source used at a device Power-on Reset event is selected using Configuration bit settings. The oscillator Configuration bit settings are located in the Configuration registers in the program memory. (Refer to **Section 21.1 "Configuration Bits"** for further details.) The Initial Oscillator Selection Configuration bits, FNOSC<2:0> (FOSCSEL<2:0>), and the Primary Oscillator Mode Select Configuration bits, POSCMD<1:0> (FOSC<1:0>), select the oscillator source that is used at a Power-on Reset. The FRC primary oscillator is the default (unprogrammed) selection.

The Configuration bits allow users to choose among 12 different clock modes, shown in Table 8-1.

The output of the oscillator (or the output of the PLL if a PLL mode has been selected) FOSC is divided by 2 to generate the device instruction clock (FCY) and the peripheral clock time base (FP). FCY defines the operating speed of the device, and speeds up to 40 MHz are supported by the dsPIC33FJ12MC201/202 architecture.

Instruction execution speed or device operating frequency, FCY, is given by:

EQUATION 8-1: DEVICE OPERATING FREQUENCY

$$FCY = \frac{FOSC}{2}$$

REGISTER 9-1: PMD1: PERIPHERAL MODULE DISABLE CONTROL REGISTER 1

U-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	U-0
—	—	T3MD	T2MD	T1MD	QEIMD	PWM1MD	—

bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-14 **Unimplemented:** Read as '0'

bit 13 **T3MD:** Timer3 Module Disable bit
1 = Timer3 module is disabled
0 = Timer3 module is enabled

bit 12 **T2MD:** Timer2 Module Disable bit
1 = Timer2 module is disabled
0 = Timer2 module is enabled

bit 11 **T1MD:** Timer1 Module Disable bit
1 = Timer1 module is disabled
0 = Timer1 module is enabled

bit 10 **QEIMD:** QEI Module Disable bit
1 = QEI module is disabled
0 = QEI module is enabled

bit 9 **PWM1MD:** PWM1 Module Disable bit
1 = PWM1 module is disabled
0 = PWM1 module is enabled

bit 18 **Unimplemented:** Read as '0'

bit 7 **I2C1MD:** I^2C1 Module Disable bit
1 = I^2C1 module is disabled
0 = I^2C1 module is enabled

bit 6 **Unimplemented:** Read as '0'

bit 5 **U1MD:** UART1 Module Disable bit
1 = UART1 module is disabled
0 = UART1 module is enabled

bit 4 **Unimplemented:** Read as '0'

bit 3 **SPI1MD:** SPI1 Module Disable bit
1 = SPI1 module is disabled
0 = SPI1 module is enabled

bit 2-1 **Unimplemented:** Read as '0'

bit 0 **AD1MD:** ADC1 Module Disable bit(1)
1 = ADC1 module is disabled
0 = ADC1 module is enabled

Note 1: PCFGx bits have no effect if the ADC module is disabled by setting this bit. When the bit is set, all port pins that have been multiplexed with ANx will be in Digital mode.

18.0 INTER-INTEGRATED CIRCUIT™ (I^2C™)

Note 1: This data sheet summarizes the features of the dsPIC33FJ12MC201/202 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. "Inter-Integrated Circuit™ (I^2C™)"** (DS70195) of the *"dsPIC33F/PIC24H Family Reference Manual"*, which is available on the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The Inter-Integrated Circuit™ (I^2C™) module provides complete hardware support for both Slave and Multi-Master modes of the I^2C serial communication standard, with a 16-bit interface.

The I^2C module has a 2-pin interface:

- The SCLx pin is clock
- The SDAx pin is data

The I^2C module offers the following key features:

- I^2C interface supporting both Master and Slave modes of operation.
- I^2C Slave mode supports 7-bit and 10-bit addresses
- I^2C Master mode supports 7-bit and 10-bit addresses
- I^2C port allows bidirectional transfers between master and slaves
- Serial clock synchronization for I^2C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- I^2C supports multi-master operation, detects bus collision and arbitrates accordingly

18.1 Operating Modes

The hardware fully implements all the master and slave functions of the I^2C Standard and Fast mode specifications, as well as 7-bit and 10-bit addressing.

The I^2C module can operate either as a slave or a master on an I^2C bus.

The following types of I^2C operation are supported:

- I^2C slave operation with 7-bit address
- I^2C slave operation with 10-bit address
- I^2C master operation with 7-bit or 10-bit address

For details about the communication sequence in each of these modes, refer to the Microchip web site (www.microchip.com) for the latest *"dsPIC33F/PIC24H Family Reference Manual"* sections.

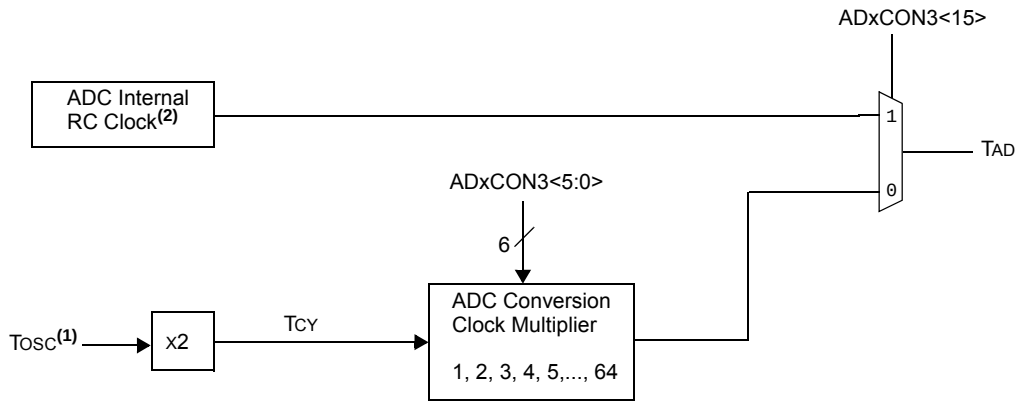
18.2 I^2C Registers

I2CxCON and I2CxSTAT are control and status registers, respectively. The I2CxCON register is readable and writable. The lower six bits of I2CxSTAT are read-only. The remaining bits of the I2CSTAT are read/write:

- I2CxRSR is the shift register used for shifting data
- I2CxRCV is the receive buffer and the register to which data bytes are written, or from which data bytes are read
- I2CxTRN is the transmit register to which bytes are written during a transmit operation
- I2CxADD register holds the slave address
- ADD10 status bit indicates 10-bit Address mode
- I2CxBRG acts as the Baud Rate Generator (BRG) reload value

In receive operations, I2CxRSR and I2CxRCV together form a double-buffered receiver. When I2CxRSR receives a complete byte, it is transferred to I2CxRCV, and an interrupt pulse is generated.

FIGURE 20-3: ADC CONVERSION CLOCK PERIOD BLOCK DIAGRAM



Note 1: Refer to Figure 8-2 for the derivation of FOSC when the PLL is enabled. If the PLL is not used, FOSC is equal to the clock frequency. TOSC = 1/FOSC.

2: See the ADC Electrical Characteristics for the exact RC clock value.

REGISTER 20-1: AD1CON1: ADC1 CONTROL REGISTER 1 (CONTINUED)

bit 2 **ASAM:** ADC Sample Auto-Start bit

1 = Sampling begins immediately after last conversion. SAMP bit is auto-set.
0 = Sampling begins when SAMP bit is set

bit 1 **SAMP:** ADC Sample Enable bit

1 = ADC sample-and-hold amplifiers are sampling
0 = ADC sample-and-hold amplifiers are holding
If ASAM = 0, software can write '1' to begin sampling. Automatically set by hardware if ASAM = 1.
If SSRC = 000, software can write '0' to end sampling and start conversion. If SSRC ≠ 000, automatically cleared by hardware to end sampling and start conversion.

bit 0 **DONE:** ADC Conversion Status bit

1 = ADC conversion cycle is completed
0 = ADC conversion not started or in progress
Automatically set by hardware when ADC conversion is complete. Software can write '0' to clear DONE status (software not allowed to write '1'). Clearing this bit will NOT affect any operation in progress. Automatically cleared by hardware at start of a new conversion.

24.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33FJ12MC201/202 electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33FJ12MC201/202 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings(1)

Ambient temperature under bias ..... -40°C to +125°C
Storage temperature ..... -65°C to +150°C
Voltage on V_{DD} with respect to V_{SS} ..... -0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to V_{SS}(4) ..... -0.3V to (V_{DD} + 0.3V)
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} \geq 3.0V$(4) ..... -0.3V to +5.6V
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} < 3.0V$(4) ..... -0.3V to (V_{DD} + 0.3V)
Maximum current out of V_{SS} pin ..... 300 mA
Maximum current into V_{DD} pin(2) ..... 250 mA
Maximum output current sunk by any I/O pin(3) ..... 4 mA
Maximum output current sourced by any I/O pin(3) ..... 4 mA
Maximum current sunk by all ports ..... 200 mA
Maximum current sourced by all ports(2) ..... 200 mA

Note 1: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

2: Maximum allowable current is a function of device maximum power dissipation (see Table 24-2).

3: Exceptions are CLKOUT, which is able to sink/source 25 mA, and the V_{REF}+, V_{REF}-, SCLx, SDAx, PGECx, and PGEDx pins, which are able to sink/source 12 mA.

4: See the **“Pin Diagrams”** section for 5V tolerant pins.

TABLE 24-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

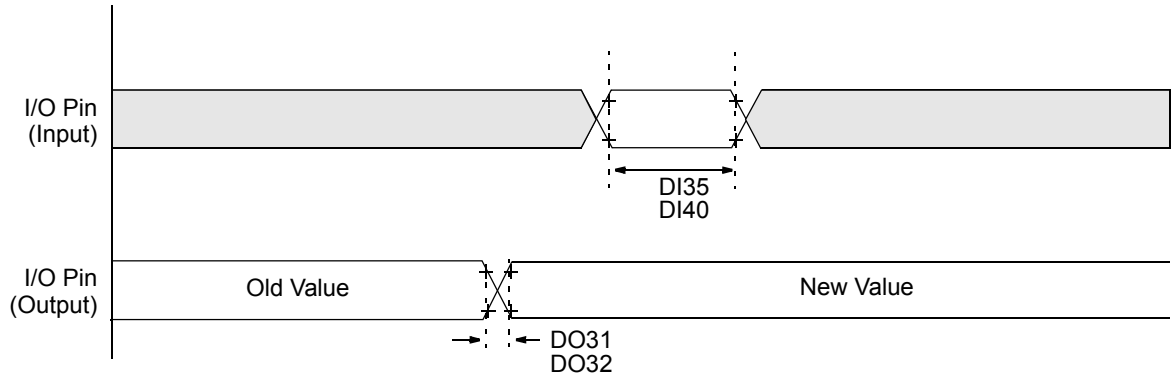
DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ(1)**	**Max**	**Units**	**Conditions**
Operating Voltage							
DC10	**Supply Voltage**						
	VDD		3.0	—	3.6	V	Industrial and Extended
DC12	VDR	**RAM Data Retention Voltage(2)**	1.8	—	—	V	—
DC16	VPOR	**VDD Start Voltage(3)** to ensure internal Power-on Reset signal	—	—	VSS	V	—
DC17	SVDD	**VDD Rise Rate** to ensure internal Power-on Reset signal	0.03	—	—	V/ms	0-3.0V in 0.1s

Note 1: Data in "Typ" column is at 3.3V, 25°C unless otherwise stated.

2: This is the limit to which VDD may be lowered without losing RAM data.

3: VDD voltage must remain at VSS for a minimum of 200 µs to ensure POR.

FIGURE 24-3: CLKO AND I/O TIMING CHARACTERISTICS



Note: Refer to Figure 24-1 for load conditions.

TABLE 24-20: I/O TIMING REQUIREMENTS

AC CHARACTERISTICS		Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended					
Param No.	**Symbol**	**Characteristic(2)**	**Min**	**Typ(1)**	**Max**	**Units**	**Conditions**
DO31	TIOR	Port Output Rise Time	—	10	25	ns	—
DO32	TIOF	Port Output Fall Time	—	10	25	ns	—
DI35	TINP	INTx Pin High or Low Time (input)	25	—	—	ns	—
DI40	TRBP	CNx High or Low Time (input)	2	—	—	TCY	—

Note 1: Data in "Typ" column is at 3.3V, 25°C unless otherwise stated.

2: These parameters are characterized, but are not tested in manufacturing.

28-Lead Plastic Small Outline (SO) - Wide, 7.50 mm Body [SOIC]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

Microchip Technology Drawing C04-052C Sheet 1 of 2

TABLE 25-1: MAJOR SECTION UPDATES

Section Name	Update Description
Section 19.0 "10-bit/12-bit Analog-to-Digital Converter (ADC)"	Updated ADC Conversion Clock Select bits in the AD1CON3 register from ADCS<**5**:0> to ADCS<**7**:0>. Any references to these bits have also been updated throughout this data sheet (Register 19-3). Replaced Figure 19-1 (ADC1 Module Block Diagram for dsPIC33FJ12MC201) and added Figure 19-2 (ADC1 Block Diagram for dsPIC33FJ12MC202). Removed Equation 19-1: ADC Conversion Clock Period and Figure 19-2: ADC Transfer Function (10-Bit Example). Added Note 2 to Figure 19-2: ADC Conversion Clock Period Block Diagram. Updated ADC1 Input Channel 1, 2, 3 Select Register (see Register 19-4) as follows: • Changed bit 10-9 (CH123NB - dsPIC33FJ12MC201 devices only) description for bit value of `10` (if AD12B = `0`). • Updated bit 8 (CH123SB) to reflect device-specific information. • Updated bit 0 (CH123SA) to reflect device-specific information. • Changed bit 2-1 (CH123NA - dsPIC33FJ12MC201 devices only) description for bit value of `10` (if AD12B = `0`). Updated ADC1 Input Channel 0 Select Register (see Register 19-5) as follows: • Changed bit value descriptions for bits 12-8 • Changed bit value descriptions for bits 4-0 (dsPIC33FJ12MC201 devices) Modified Notes 1 and 2 in the ADC1 Input Scan Select Register Low (see Register 19-6) Modified Notes 1 and 2 in the ADC1 Port Configuration Register Low (see Register 19-7)
Section 20.0 "Special Features"	Added FICD register information for address 0xF8000E in the Device Configuration Register Map (see Table 20-1). Added FICD register content (BKBUG, COE, JTAGEN, and ICS<1:0> to the dsPIC33FJ12MC201/202 Configuration Bits Description (see Table 20-2). Added a note regarding the placement of low-ESR capacitors, after the second paragraph of **Section 20.2 "On-Chip Voltage Regulator"** and to Figure 20-2. Removed the words "if enabled" from the second sentence in the fifth paragraph of **Section 20.3 "BOR: Brown-out Reset"**

TABLE 25-1: MAJOR SECTION UPDATES

Section Name	Update Description
Section 23.0 "Electrical Characteristics"	Updated Max MIPS value for -40ºC to +125ºC temperature range in Operating MIPS vs. Voltage (see Table 23-1). Added 20-pin SOIC and 28-pin SSOP package information to Thermal Packaging Characteristics and updated Typical values for all devices (see Table 23-3). Removed Typ value for parameter DC12 (see Table 23-4). Updated Note 2 in Table 23-7: DC Characteristics: Power-Down Current (IPD). Updated MIPS conditions for parameters DC24c, DC44c, DC72a, DC72f, and DC72g (see Table 23-5, Table 23-6, and Table 23-8). Added Note 4 (reference to new table containing digital-only and analog pin information to I/O Pin Input Specifications (see Table 23-9). Updated Program Memory parameters (D136a, D136b, D137a, D137b, D138a, and D138b) and added Note 2 (see Table 23-12). Updated Max value for Internal RC Accuracy parameter F21 for -40°C ≤TA ≤ +125°C condition and added Note 2 (see Table 23-19). Removed all values for Reset, Watchdog Timer, Oscillator Start-up Timer, and Power-up Timer parameter SY20 and updated conditions, which now refers to **Section 20.4 "Watchdog Timer (WDT)"** and LPRC parameter F21 (Table 23-21). Updated Min value for Input Capture Timing Requirements parameter IC15 (see Table 23-26). The following changes were made to the ADC Module Specifications (Table 23-38): • Updated Min value for ADC Module Specification parameter AD07. • Updated Typ value for parameter AD08 • Added references to Note 1 for parameters AD12 and AD13 • Removed Note 2. The following changes were made to the ADC Module Specifications (12-bit Mode) (Table 23-39): • Updated Min and Max values for both AD21a parameters (measurements with *internal* and *external* VREF+/VREF-). • Updated Min, Typ, and Max values for parameter AD24a. • Updated Max value for parameter AD32a. • Removed Note 1. • Removed VREFL from Conditions for parameters AD21a, AD22a, AD23a, and AD24a (measurements with *internal* VREF+/VREF-). The following changes were made to the ADC Module Specifications (10-bit Mode) (Table 23-40): • Updated Min and Max values for parameter AD21b (measurements with *external* VREF+/VREF-). • Removed ± symbol from Min, Typ, and Max values for parameters AD23b and AD24b (measurements with *internal* VREF+/VREF-). • Updated Typ and Max values for parameter AD32b. • Removed Note 1. • Removed VREFL from Conditions for parameters AD21a, AD22a, AD23a, and AD24a (measurements with *internal* VREF+/VREF-). Updated Min and Typ values for parameters AD60, AD61, AD62, and AD63 and removed Note 3 (see Table 23-41 and Table 23-42).
