
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	80C51
Core Size	8-Bit
Speed	40/20MHz
Connectivity	UART/USART
Peripherals	POR
Number of I/O	32
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	128 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-QFP
Supplier Device Package	44-PQFP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ts80c31x2-mic

4. SFR Mapping

The Special Function Registers (SFRs) of the TS80C31X2 fall into the following categories:

- C51 core registers: ACC, B, DPH, DPL, PSW, SP, AUXR1
- I/O port registers: P0, P1, P2, P3
- Timer registers: TCON, TH0, TH1, TMOD, TL0, TL1
- Serial I/O port registers: SADDR, SADEN, SBUF, SCON
- Power and clock control registers: PCON
- Interrupt system registers: IE, IP, IPH
- Others: CKCON

Table 1. All SFRs with their address and their reset value

	Bit address-able	**Non Bit addressable**							
	0/8	1/9	2/A	3/B	4/C	5/D	6/E	7/F

6. TS80C31X2 Enhanced Features

In comparison to the original 80C31, the TS80C31X2 implements some new features, which are:

- The X2 option.
- The Dual Data Pointer.
- The 4 level interrupt priority system.
- The power-off flag.
- The ONCE mode.
- Enhanced UART

6.1 X2 Feature

The TS80C31X2 core needs only 6 clock periods per machine cycle. This feature called "X2" provides the following advantages:

- Divide frequency crystals by 2 (cheaper crystals) while keeping same CPU power.
- Save power consumption while keeping same CPU power (oscillator power saving).
- Save power consumption by dividing dynamically operating frequency by 2 in operating and idle modes.
- Increase CPU power by 2 while keeping same crystal frequency.

In order to keep the original C51 compatibility, a divider by 2 is inserted between the XTAL1 signal and the main clock input of the core (phase generator). This divider may be disabled by software.

6.1.1 Description

The clock for the whole circuit and peripheral is first divided by two before being used by the CPU core and peripherals. This allows any cyclic ratio to be accepted on XTAL1 input. In X2 mode, as this divider is bypassed, the signals on XTAL1 must have a cyclic ratio between 40 to 60%. Figure 1. shows the clock generation block diagram. X2 bit is validated on XTAL1÷2 rising edge to avoid glitches when switching from X2 to STD mode. Figure 2. shows the mode switching waveforms.

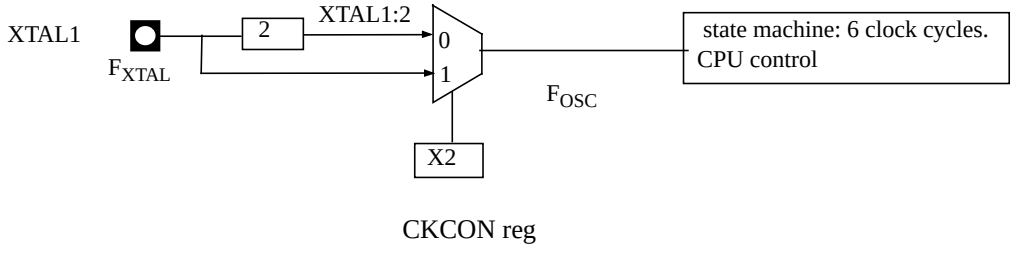

Figure 1. Clock Generation Diagram

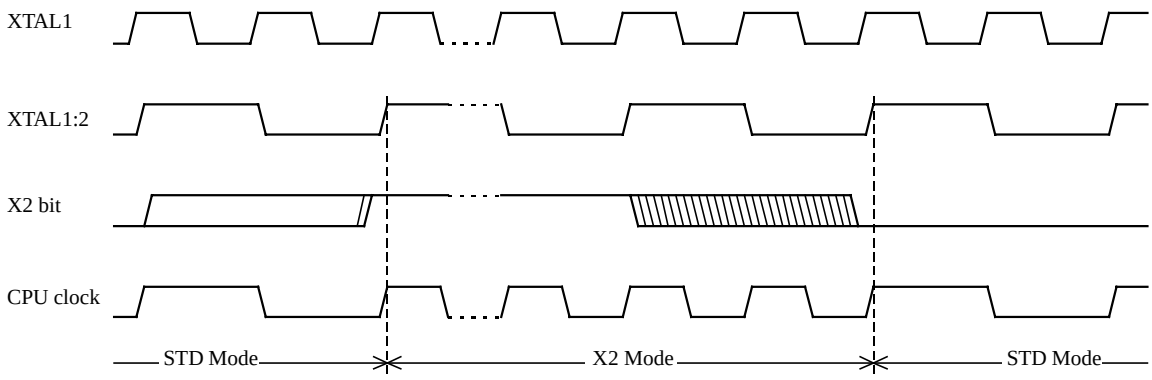

Figure 2. Mode Switching Waveforms

The X2 bit in the CKCON register (See Table 3.) allows to switch from 12 clock cycles per instruction to 6 clock cycles and vice versa. At reset, the standard speed is activated (STD mode). Setting this bit activates the X2 feature (X2 mode).

CAUTION

In order to prevent any incorrect operation while operating in X2 mode, user must be aware that all peripherals using clock frequency as time reference (UART, timers) will have their time reference divided by two. For example a free running timer generating an interrupt every 20 ms will then generate an interrupt every 10 ms. UART with 4800 baud rate will have 9600 baud rate.

ASSEMBLY LANGUAGE

```
; Block move using dual data pointers
; Destroys DPTR0, DPTR1, A and PSW
; note: DPS exits opposite of entry state
; unless an extra INC AUXR1 is added
;
00A2          AUXR1 EQU 0A2H
;
0000 909000MOV DPTR,#SOURCE      ; address of SOURCE
0003 05A2   INC   AUXR1          ; switch data pointers
0005 90A000 MOV DPTR,#DEST       ; address of DEST
0008          LOOP:
0008 05A2   INC   AUXR1          ; switch data pointers
000A E0     MOVX A,@DPTR         ; get a byte from SOURCE
000B A3     INC   DPTR           ; increment SOURCE address
000C 05A2   INC   AUXR1          ; switch data pointers
000E F0     MOVX @DPTR,A         ; write the byte to DEST
000F A3     INC   DPTR           ; increment DEST address
0010 70F6   JNZ   LOOP           ; check for 0 terminator
0012 05A2   INC   AUXR1          ; (optional) restore DPS
```

INC is a short (2 bytes) and fast (12 clocks) way to manipulate the DPS bit in the AUXR1 SFR. However, note that the INC instruction does not directly force the DPS bit to a particular state, but simply toggles it. In simple routines, such as the block move example, only the fact that DPS is toggled in the proper sequence matters, not its actual value. In other words, the block move routine works the same whether DPS is '0' or '1' on entry. Observe that without the last instruction (INC AUXR1), the routine will exit with DPS in the opposite state.

6.3 TS80C31X2 Serial I/O Port

The serial I/O port in the TS80C31X2 is compatible with the serial I/O port in the 80C31.
It provides both synchronous and asynchronous communication modes. It operates as an Universal Asynchronous Receiver and Transmitter (UART) in three full-duplex modes (Modes 1, 2 and 3). Asynchronous transmission and reception can occur simultaneously and at different baud rates

Serial I/O port includes the following enhancements:

- Framing error detection
- Automatic address recognition

6.3.1 Framing Error Detection

Framing bit error detection is provided for the three asynchronous modes (modes 1, 2 and 3). To enable the framing bit error detection feature, set SMOD0 bit in PCON register (See Figure 4).

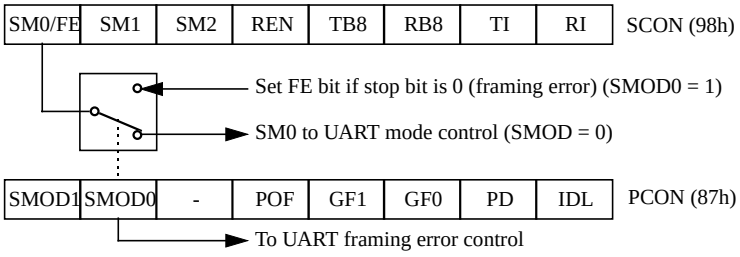

Figure 4. Framing Error Block Diagram

When this feature is enabled, the receiver checks each incoming data frame for a valid stop bit. An invalid stop bit may result from noise on the serial lines or from simultaneous transmission by two CPUs. If a valid stop bit is not found, the Framing Error bit (FE) in SCON register (See Table 5.) bit is set.

Software may examine FE bit after each reception to check for data errors. Once set, only software or a reset can clear FE bit. Subsequently received frames with valid stop bits cannot clear FE bit. When FE feature is enabled, RI rises on stop bit instead of the last data bit (See Figure 5. and Figure 6.).

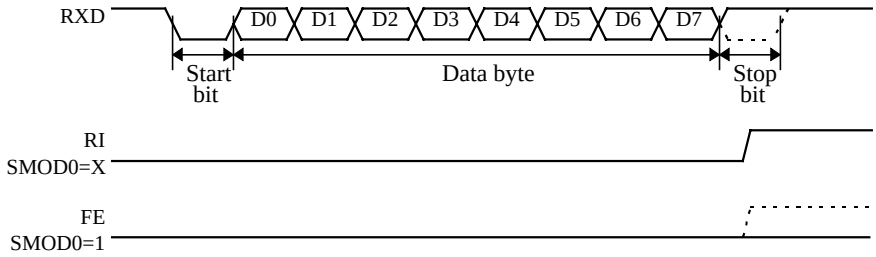

Figure 5. UART Timings in Mode 1

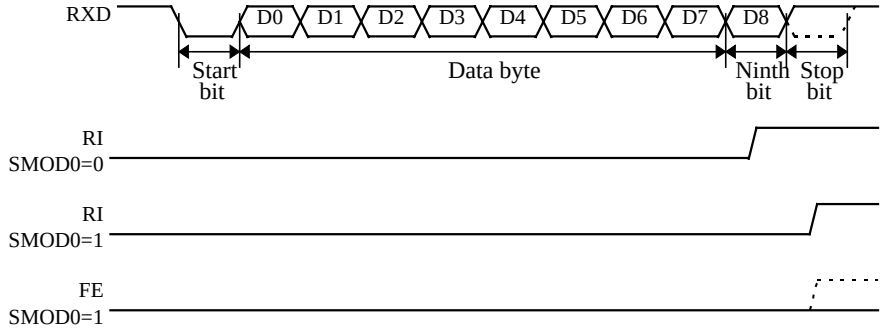

Figure 6. UART Timings in Modes 2 and 3

6.3.2 Automatic Address Recognition

The automatic address recognition feature is enabled when the multiprocessor communication feature is enabled (SM2 bit in SCON register is set).

Implemented in hardware, automatic address recognition enhances the multiprocessor communication feature by allowing the serial port to examine the address of each incoming command frame. Only when the serial port recognizes its own address, the receiver sets RI bit in SCON register to generate an interrupt. This ensures that the CPU is not interrupted by command frames addressed to other devices.

If desired, you may enable the automatic address recognition feature in mode 1. In this configuration, the stop bit takes the place of the ninth data bit. Bit RI is set only when the received command frame address matches the device's address and is terminated by a valid stop bit.

To support automatic address recognition, a device is identified by a given address and a broadcast address.

NOTE: The multiprocessor communication and automatic address recognition features cannot be enabled in mode 0 (i.e. setting SM2 bit in SCON register in mode 0 has no effect).

6.3.3 Given Address

Each device has an individual address that is specified in SADDR register; the SADEN register is a mask byte that contains don't-care bits (defined by zeros) to form the device's given address. The don't-care bits provide the flexibility to address one or more slaves at a time. The following example illustrates how a given address is formed. To address a device by its individual address, the SADEN mask byte must be 1111 1111b.
For example:

```
           SADDR      0101 0110b
           SADEN      1111 1100b
           Given      0101 01XXb
```

The following is an example of how to use given addresses to address different slaves:

```
Slave A:   SADDR      1111 0001b
           SADEN      1111 1010b
           Given      1111 0X0Xb

Slave B:   SADDR      1111 0011b
           SADEN      1111 1001b
           Given      1111 0XX1b

Slave C:   SADDR      1111 0010b
           SADEN      1111 1101b
           Given      1111 00X1b
```

The SADEN byte is selected so that each slave may be addressed separately.
For slave A, bit 0 (the LSB) is a don't-care bit; for slaves B and C, bit 0 is a 1. To communicate with slave A only, the master must send an address where bit 0 is clear (e.g. 1111 0000b).
For slave A, bit 1 is a 1; for slaves B and C, bit 1 is a don't care bit. To communicate with slaves B and C, but not slave A, the master must send an address with bits 0 and 1 both set (e.g. 1111 0011b).
To communicate with slaves A, B and C, the master must send an address with bit 0 set, bit 1 clear, and bit 2 clear (e.g. 1111 0001b).

6.3.4 Broadcast Address

A broadcast address is formed from the logical OR of the SADDR and SADEN registers with zeros defined as don't-care bits, e.g.:

```
           SADDR            0101 0110b
           SADEN            1111 1100b
Broadcast =SADDR OR SADEN   1111 111Xb
```

The use of don't-care bits provides flexibility in defining the broadcast address, however in most applications, a broadcast address is FFh. The following is an example of using broadcast addresses:

```
Slave A:   SADDR      1111 0001b
           SADEN      1111 1010b
           Broadcast  1111 1X11b,

Slave B:   SADDR      1111 0011b
           SADEN      1111 1001b
           Broadcast  1111 1X11B,

Slave C:   SADDR=     1111 0010b
           SADEN      1111 1101b
           Broadcast  1111 1111b
```

For slaves A and B, bit 2 is a don't care bit; for slave C, bit 2 is set. To communicate with all of the slaves, the master must send an address FFh. To communicate with slaves A and B, but not slave C, the master can send and address FBh.

6.3.5 Reset Addresses

On reset, the SADDR and SADEN registers are initialized to 00h, i.e. the given and broadcast addresses are XXXX XXXXb (all don't-care bits). This ensures that the serial port will reply to any address, and so, that it is backwards compatible with the 80C51 microcontrollers that do not support automatic address recognition.

SADEN - Slave Address Mask Register (B9h)

7	6	5	4	3	2	1	0

Reset Value = 0000 0000b
Not bit addressable

SADDR - Slave Address Register (A9h)

7	6	5	4	3	2	1	0

Reset Value = 0000 0000b
Not bit addressable

Table 5. SCON Register

SCON - Serial Control Register (98h)

7	6	5	4	3	2	1	0
FE/SM0	**SM1**	**SM2**	**REN**	**TB8**	**RB8**	**TI**	**RI**

Bit Number	Bit Mnemonic	Description
7	FE	**Framing Error bit (SMOD0=1)** Clear to reset the error state, not cleared by a valid stop bit. Set by hardware when an invalid stop bit is detected. SMOD0 must be set to enable access to the FE bit
	SM0	**Serial port Mode bit 0** Refer to SM1 for serial port mode selection. SMOD0 must be cleared to enable access to the SM0 bit
6	SM1	**Serial port Mode bit 1** SM0 SM1 Mode Description Baud Rate 0 0 0 Shift Register F_{XTAL}/12 (/6 in X2 mode) 0 1 1 8-bit UART Variable 1 0 2 9-bit UART F_{XTAL}/64 or F_{XTAL}/32 (/32, /16 in X2 mode) 1 1 3 9-bit UART Variable
5	SM2	**Serial port Mode 2 bit / Multiprocessor Communication Enable bit** Clear to disable multiprocessor communication feature. Set to enable multiprocessor communication feature in mode 2 and 3, and eventually mode 1. This bit should be cleared in mode 0.
4	REN	**Reception Enable bit** Clear to disable serial reception. Set to enable serial reception.
3	TB8	**Transmitter Bit 8 / Ninth bit to transmit in modes 2 and 3.** Clear to transmit a logic 0 in the 9th bit. Set to transmit a logic 1 in the 9th bit.
2	RB8	**Receiver Bit 8 / Ninth bit received in modes 2 and 3** Cleared by hardware if 9th bit received is a logic 0. Set by hardware if 9th bit received is a logic 1. In mode 1, if SM2 = 0, RB8 is the received stop bit. In mode 0 RB8 is not used.
1	TI	**Transmit Interrupt flag** Clear to acknowledge interrupt. Set by hardware at the end of the 8th bit time in mode 0 or at the beginning of the stop bit in the other modes.
0	RI	**Receive Interrupt flag** Clear to acknowledge interrupt. Set by hardware at the end of the 8th bit time in mode 0, see Figure 5. and Figure 6. in the other modes.

Reset Value = 0000 0000b
Bit addressable

Table 6. PCON Register

PCON - Power Control Register (87h)

7	6	5	4	3	2	1	0
SMOD1	**SMOD0**	**-**	**POF**	**GF1**	**GF0**	**PD**	**IDL**

Bit Number	Bit Mnemonic	Description
7	SMOD1	**Serial port Mode bit 1** Set to select double baud rate in mode 1, 2 or 3.
6	SMOD0	**Serial port Mode bit 0** Clear to select SM0 bit in SCON register. Set to to select FE bit in SCON register.
5	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
4	POF	**Power-Off Flag** Clear to recognize next reset type. Set by hardware when VCC rises from 0 to its nominal voltage. Can also be set by software.
3	GF1	**General purpose Flag** Cleared by user for general purpose usage. Set by user for general purpose usage.
2	GF0	**General purpose Flag** Cleared by user for general purpose usage. Set by user for general purpose usage.
1	PD	**Power-Down mode bit** Cleared by hardware when reset occurs. Set to enter power-down mode.
0	IDL	**Idle mode bit** Clear by hardware when interrupt or reset occurs. Set to enter idle mode.

Reset Value = 00X1 0000b
Not bit addressable

Power-off flag reset value will be 1 only after a power on (cold reset). A warm reset doesn't affect the value of this bit.

Table 7. Priority Level Bit Values

IPH.x	IP.x	Interrupt Level Priority
0	0	0 (Lowest)
0	1	1
1	0	2
1	1	3 (Highest)

A low-priority interrupt can be interrupted by a high priority interrupt, but not by another low-priority interrupt. A high-priority interrupt can't be interrupted by any other interrupt source.

If two interrupt requests of different priority levels are received simultaneously, the request of higher priority level is serviced. If interrupt requests of the same priority level are received simultaneously, an internal polling sequence determines which request is serviced. Thus within each priority level there is a second priority structure determined by the polling sequence.

Table 8. IE Register

IE - Interrupt Enable Register (A8h)

7	6	5	4	3	2	1	0
EA	-	-	ES	ET1	EX1	ET0	EX0

Bit Number	Bit Mnemonic	Description
7	EA	**Enable All interrupt bit** Clear to disable all interrupts. Set to enable all interrupts. If EA=1, each interrupt source is individually enabled or disabled by setting or clearing its own interrupt enable bit.
6	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
5	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
4	ES	**Serial port Enable bit** Clear to disable serial port interrupt. Set to enable serial port interrupt.
3	ET1	**Timer 1 overflow interrupt Enable bit** Clear to disable timer 1 overflow interrupt. Set to enable timer 1 overflow interrupt.
2	EX1	**External interrupt 1 Enable bit** Clear to disable external interrupt 1. Set to enable external interrupt 1.
1	ET0	**Timer 0 overflow interrupt Enable bit** Clear to disable timer 0 overflow interrupt. Set to enable timer 0 overflow interrupt.
0	EX0	**External interrupt 0 Enable bit** Clear to disable external interrupt 0. Set to enable external interrupt 0.

Reset Value = 0XX0 0000b
Bit addressable

Table 9. IP Register

IP - Interrupt Priority Register (B8h)

7	6	5	4	3	2	1	0
-	-	-	PS	PT1	PX1	PT0	PX0

Bit Number	Bit Mnemonic	Description
7	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
6	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
5	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
4	PS	**Serial port Priority bit** Refer to PSH for priority level.
3	PT1	**Timer 1 overflow interrupt Priority bit** Refer to PT1H for priority level.
2	PX1	**External interrupt 1 Priority bit** Refer to PX1H for priority level.
1	PT0	**Timer 0 overflow interrupt Priority bit** Refer to PT0H for priority level.
0	PX0	**External interrupt 0 Priority bit** Refer to PX0H for priority level.

Reset Value = XXX0 0000b
Bit addressable

6.5 Idle mode

An instruction that sets PCON.0 causes that to be the last instruction executed before going into the Idle mode. In the Idle mode, the internal clock signal is gated off to the CPU, but not to the interrupt, Timer, and Serial Port functions. The CPU status is preserved in its entirely : the Stack Pointer, Program Counter, Program Status Word, Accumulator and all other registers maintain their data during Idle. The port pins hold the logical states they had at the time Idle was activated. ALE and PSEN hold at logic high levels.

There are two ways to terminate the Idle. Activation of any enabled interrupt will cause PCON.0 to be cleared by hardware, terminating the Idle mode. The interrupt will be serviced, and following RETI the next instruction to be executed will be the one following the instruction that put the device into idle.

The flag bits GF0 and GF1 can be used to give and indication if an interrupt occured during normal operation or during an Idle. For example, an instruction that activates Idle can also set one or both flag bits. When Idle is terminated by an interrupt, the interrupt service routine can examine the flag bits.

The over way of terminating the Idle mode is with a hardware reset. Since the clock oscillator is still running, the hardware reset needs to be held active for only two machine cycles (24 oscillator periods) to complete the reset.

6.6 Power-Down Mode

To save maximum power, a power-down mode can be invoked by software (Refer to Table 6., PCON register).

In power-down mode, the oscillator is stopped and the instruction that invoked power-down mode is the last instruction executed. The internal RAM and SFRs retain their value until the power-down mode is terminated. V_{CC} can be lowered to save further power. Either a hardware reset or an external interrupt can cause an exit from power-down. To properly terminate power-down, the reset or external interrupt should not be executed before V_{CC} is restored to its normal operating level and must be held active long enough for the oscillator to restart and stabilize.

Only external interrupts $\overline{INT0}$ and $\overline{INT1}$ are useful to exit from power-down. For that, interrupt must be enabled and configured as level or edge sensitive interrupt input.
Holding the pin low restarts the oscillator but bringing the pin high completes the exit as detailed in Figure 8. When both interrupts are enabled, the oscillator restarts as soon as one of the two inputs is held low and power down exit will be completed when the first input will be released. In this case the higher priority interrupt service routine is executed.
Once the interrupt is serviced, the next instruction to be executed after RETI will be the one following the instruction that put TS80C31X2 into power-down mode.

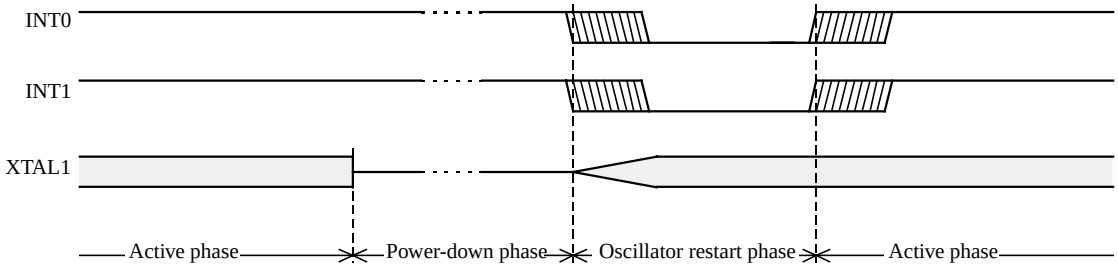

Figure 8. Power-Down Exit Waveform

Exit from power-down by reset redefines all the SFRs, exit from power-down by external interrupt does no affect the SFRs.

Exit from power-down by either reset or external interrupt does not affect the internal RAM content.
NOTE: If idle mode is activated with power-down mode (IDL and PD bits set), the exit sequence is unchanged, when execution is vectored to interrupt, PD and IDL bits are cleared and idle mode is not entered.

6.7 ONCE™ Mode (ON Chip Emulation)

The ONCE mode facilitates testing and debugging of systems using TS80C31X2 without removing the circuit from the board. The ONCE mode is invoked by driving certain pins of the TS80C31X2; the following sequence must be exercised:

- Pull ALE low while the device is in reset (RST high) and $\overline{PSEN}$ is high.
- Hold ALE low as RST is deactivated.

While the TS80C31X2 is in ONCE mode, an emulator or test CPU can be used to drive the circuit Table 26. shows the status of the port pins during ONCE mode.

Normal operation is restored when normal reset is applied.

Table 12. External Pin Status during ONCE Mode

ALE	$\overline{PSEN}$	Port 0	Port 1	Port 2	Port 3	XTAL1/2
Weak pull-up	Weak pull-up	Float	Weak pull-up	Weak pull-up	Weak pull-up	Active

7.3 DC Parameters for Standard Voltage

T_A = 0°C to +70°C; V_{SS} = 0 V; V_{CC} = 5 V ± 10%; F = 0 to 40 MHz.
T_A = -40°C to +85°C; V_{SS} = 0 V; V_{CC} = 5 V ± 10%; F = 0 to 40 MHz.

Table 14. DC Parameters in Standard Voltage

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
I_{CC} operating	Power Supply Current Maximum values, X1 mode: (7)			3 + 0.6 Freq (MHz) @12MHz 10.2 @16MHz 12.6	mA	V_{CC} = 5.5 V(8)
I_{CC} idle	Power Supply Current Maximum values, X1 mode: (7)			0.25+0.3Freq (MHz) @12MHz 3.9 @16MHz 5.1	mA	V_{CC} = 5.5 V(2)

7.4 DC Parameters for Low Voltage

T_A = 0°C to +70°C; V_{SS} = 0 V; V_{CC} = 2.7 V to 5.5 V ± 10%; F = 0 to 30 MHz.
T_A = -40°C to +85°C; V_{SS} = 0 V; V_{CC} = 2.7 V to 5.5 V ± 10%; F = 0 to 30 MHz.

Table 15. DC Parameters for Low Voltage

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
V_{IL}	Input Low Voltage	-0.5		0.2 V_{CC} - 0.1	V	
V_{IH}	Input High Voltage except XTAL1, RST	0.2 V_{CC} + 0.9		V_{CC} + 0.5	V	
V_{IH1}	Input High Voltage, XTAL1, RST	0.7 V_{CC}		V_{CC} + 0.5	V	
V_{OL}	Output Low Voltage, ports 1, 2, 3 (6)			0.45	V	I_{OL} = 0.8 mA(4)
V_{OL1}	Output Low Voltage, port 0, ALE, $\overline{PSEN}$ (6)			0.45	V	I_{OL} = 1.6 mA(4)
V_{OH}	Output High Voltage, ports 1, 2, 3	0.9 V_{CC}			V	I_{OH} = -10 µA
V_{OH1}	Output High Voltage, port 0, ALE, $\overline{PSEN}$	0.9 V_{CC}			V	I_{OH} = -40 µA
I_{IL}	Logical 0 Input Current ports 1, 2 and 3			-50	µA	Vin = 0.45 V
I_{LI}	Input Leakage Current			±10	µA	0.45 V < Vin < V_{CC}
I_{TL}	Logical 1 to 0 Transition Current, ports 1, 2, 3			-650	µA	Vin = 2.0 V
R_{RST}	RST Pulldown Resistor	50	90 (5)	200	kΩ	
CIO	Capacitance of I/O Buffer			10	pF	Fc = 1 MHz T_A = 25°C
I_{PD}	Power Down Current		20 (5) 10 (5)	50 30	µA	V_{CC} = 2.0 V to 5.5 V(3) V_{CC} = 2.0 V to 3.3 V(3)
I_{CC} under RESET	Power Supply Current Maximum values, X1 mode: (7)			1 + 0.2 Freq (MHz) @12MHz 3.4 @16MHz 4.2	mA	V_{CC} = 3.3 V(1)
I_{CC} operating	Power Supply Current Maximum values, X1 mode: (7)			1 + 0.3 Freq (MHz) @12MHz 4.6 @16MHz 5.8	mA	V_{CC} = 3.3 V(8)

Table 20. AC Parameters for a Variable Clock: derating formula

Symbol	Type	Standard Clock	X2 Clock	-M	-V	-L	Units
T_{LHLL}	Min	2 T - x	T - x	10	8	15	ns
T_{AVLL}	Min	T - x	0.5 T - x	15	13	20	ns
T_{LLAX}	Min	T - x	0.5 T - x	15	13	20	ns
T_{LLIV}	Max	4 T - x	2 T - x	30	22	35	ns
T_{LLPL}	Min	T - x	0.5 T - x	10	8	15	ns
T_{PLPH}	Min	3 T - x	1.5 T - x	20	15	25	ns
T_{PLIV}	Max	3 T - x	1.5 T - x	40	25	45	ns
T_{PXIX}	Min	x	x	0	0	0	ns
T_{PXIZ}	Max	T - x	0.5 T - x	7	5	15	ns
T_{AVIV}	Max	5 T - x	2.5 T - x	40	30	45	ns
T_{PLAZ}	Max	x	x	10	10	10	ns

7.5.3 External Program Memory Read Cycle

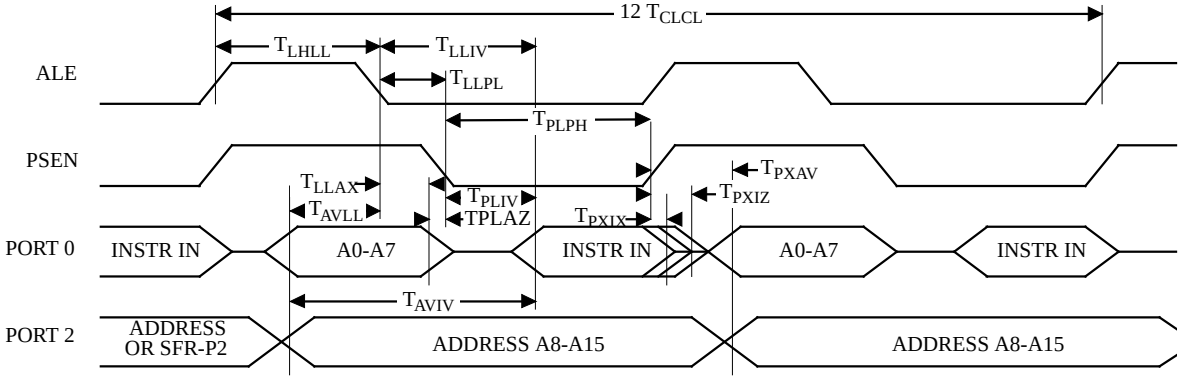

Figure 14. External Program Memory Read Cycle

7.5.6 External Data Memory Read Cycle

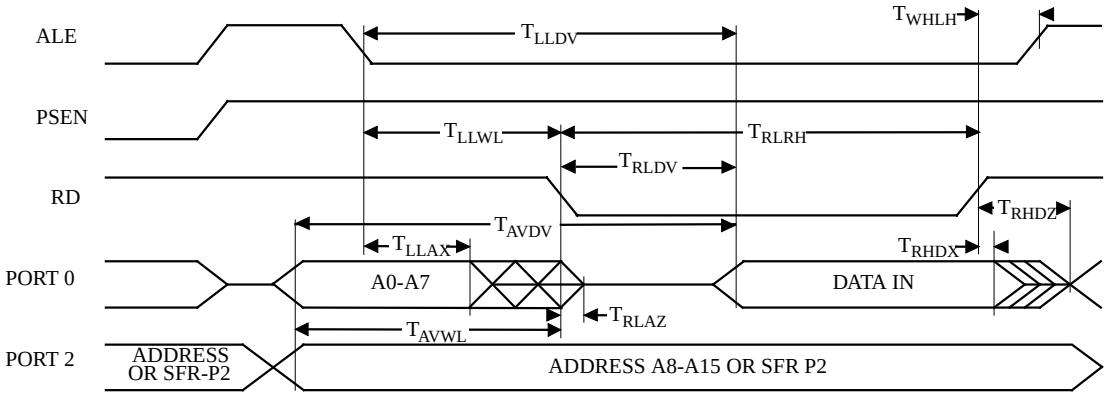

Figure 16. External Data Memory Read Cycle

7.5.7 Serial Port Timing - Shift Register Mode

Table 24. Symbol Description

Symbol	Parameter
T_{XLXL}	Serial port clock cycle time
T_{QVHX}	Output data set-up to clock rising edge
T_{XHQX}	Output data hold after clock rising edge
T_{XHDX}	Input data hold after clock rising edge
T_{XHDV}	Clock rising edge to input data valid

Table 25. AC Parameters for a Fix Clock

Speed	-M 40 MHz		-V X2 mode 30 MHz 60 MHz equiv.		-V standard mode 40 MHz		-L X2 mode 20 MHz 40 MHz equiv.		-L standard mode 30 MHz		Units
Symbol	Min	Max	Min	Max	Min	Max	Min	Max	Min	Max	
T_{XLXL}	300		200		300		300		400		ns
T_{QVHX}	200		117		200		200		283		ns
T_{XHQX}	30		13		30		30		47		ns
T_{XHDX}	0		0		0		0		0		ns
T_{XHDV}		117		34		117		117		200	ns

For timing purposes a port pin is no longer floating when a 100 mV change from load voltage occurs and begins to float when a 100 mV change from the loaded V_{OH}/V_{OL} level occurs. $I_{OL}/I_{OH} \geq \pm$ 20mA.

7.5.13 Clock Waveforms

Valid in normal clock mode. In X2 mode XTAL2 signal must be changed to XTAL2 divided by two.

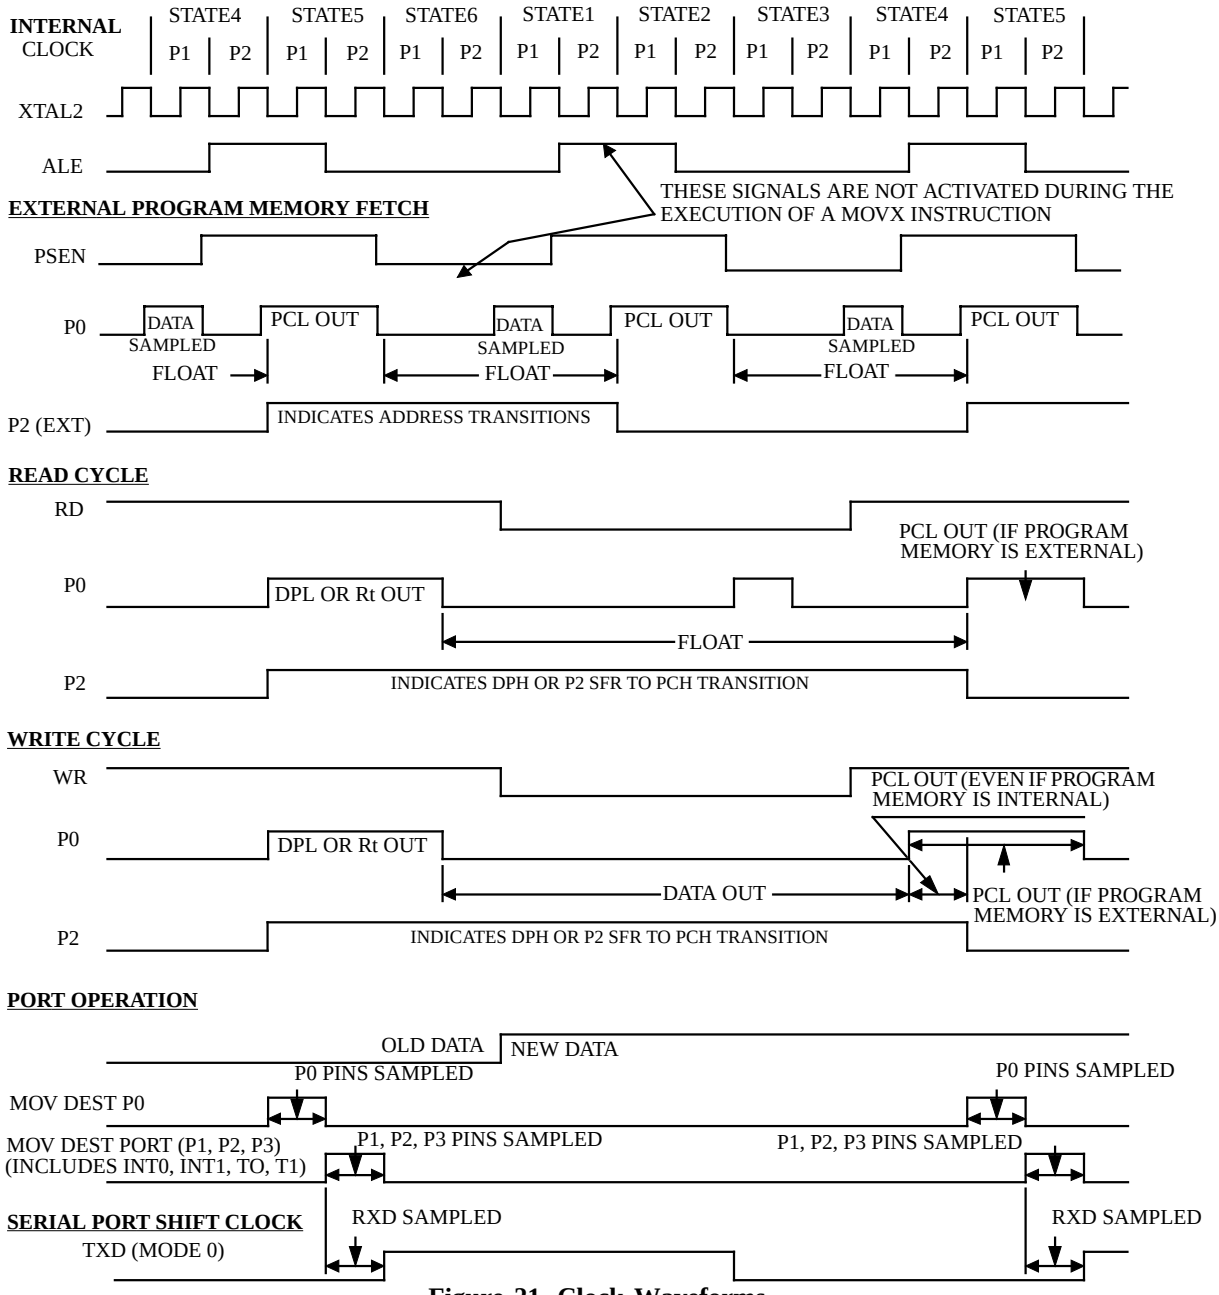

Figure 21. Clock Waveforms

This diagram indicates when signals are clocked internally. The time it takes the signals to propagate to the pins, however, ranges from 25 to 125 ns. This propagation delay is dependent on variables such as temperature and pin loading. Propagation also varies from output to output and component. Typically though (T_A=25°C fully loaded) $\overline{RD}$ and $\overline{WR}$ propagation delays are approximately 50ns. The other signals are typically 85 ns. Propagation delays are incorporated in the AC specifications.

8. Ordering Information

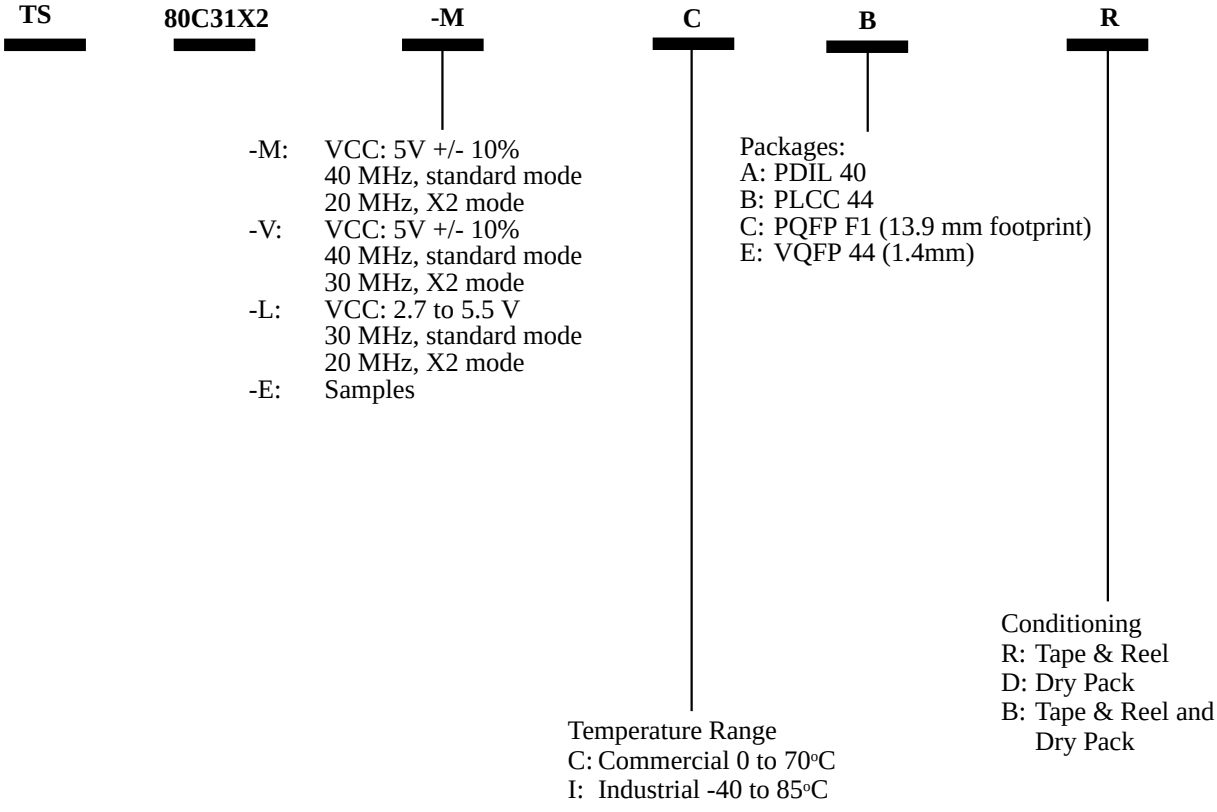

Table 28. Maximum Clock Frequency

Code	-M	-V	-L	Unit
Standard Mode, oscillator frequency Standard Mode, internal frequency	40 40	40 40	30 30	MHz
X2 Mode, oscillator frequency X2 Mode, internal equivalent frequency	20 40	30 **60**	20 **40**	MHz
