What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

9.8.1 How to Use Oscillation Stop Detection Function

- The oscillation stop detection interrupt shares a vector with the voltage monitor 1 interrupt, the voltage monitor 2 interrupt, and the watchdog timer interrupt. To use the oscillation stop detection interrupt and watchdog timer interrupt, the interrupt source needs to be determined.
  Table 9.6 lists the Determination of Interrupt Sources for Oscillation Stop Detection, Watchdog Timer, Voltage Monitor 1, or Voltage Monitor 2 Interrupt. Figure 9.11 shows an Example of Determining Interrupt Sources for Oscillation Stop Detection, Watchdog Timer, Voltage Monitor 1, or Voltage Monitor 2 Interrupt.
- When the XIN clock restarts after oscillation stop, switch the XIN clock to the clock source for the CPU clock and the peripheral functions by a program.
  Figure 9.10 shows the Procedure for Switching Clock Source from Low-Speed On-Chip Oscillator to XIN Clock.
- To enter wait mode while the oscillation stop detection function is used, set the CM02 bit to 0 (peripheral function clock does not stop in wait mode).
- Since the oscillation stop detection function is a function for cases where the XIN clock is stopped by an external cause, set bits OCD1 to OCD0 to 00b to stop or start the XIN clock by a program (select stop mode or change the CM05 bit).
- This function cannot be used when the XIN clock frequency is below 2 MHz. In this case, set bits OCD1 to OCD0 to 00b.
- To use the low-speed on-chip oscillator clock as the clock source for the CPU clock and the peripheral functions after detecting the oscillation stop, set the FRA01 bit in the FRA0 register to 0 (low-speed on-chip oscillator selected) and bits OCD1 to OCD0 to 11b.
  To use the high-speed on-chip oscillator clock as the clock source for the CPU clock and the peripheral functions after detecting the oscillation stop, first set the FRA00 bit to 1 (high-speed on-chip oscillator oscillates) and the FRA01 bit to 1 (high-speed on-chip oscillator selected). Then set bits OCD1 to OCD0 to 11b.

Notes:
1. The OFS register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.
   Do not write additions to the OFS register. If the block including the OFS register is erased, the OFS register is set to FFh.
   When blank products are shipped, the OFS register is set to FFh. It is set to the written value after written by the user.
   When factory-programming products are shipped, the value of the OFS register is the value programmed by the user.
2. The same level of the voltage detection 0 level selected by bits VDSEL0 and VDESL1 is set in both functions of voltage monitor 0 reset and power-on reset.
3. To use power-on reset and voltage monitor 0 reset, set the LVDAS bit to 0 (voltage monitor 0 reset enabled after reset).

For a setting example of the OFS register, refer to **13.3.1 Setting Example of Option Function Select Area**.

LVDAS Bit (Voltage Detection 0 Circuit Start Bit)

The Vdet0 voltage to be monitored by the voltage detection 0 circuit is selected by bits VDSEL0 and VDSEL1.

18. Timer RC

Timer RC is a 16-bit timer with four I/O pins.

18.1 Overview

Timer RC uses either f1, fOCO40M or fOCO-F as its operation clock. Table 18.1 lists the Timer RC Operation Clock.

Table 18.1 Timer RC Operation Clock

Condition	Timer RC Operation Clock
Count source is f1, f2, f4, f8, f32, or TRCCLK input (bits TCK2 to TCK0 in TRCCR1 register are set to a value from 000b to 101b)	f1
Count source is fOCO40M (bits TCK2 to TCK0 in TRCCR1 register are set to 110b)	fOCO40M
Count source is fOCO-F (bits TCK2 to TCK0 in TRCCR1 register are set to 111b)	fOCO-F

Table 18.2 lists the Pin Configuration of Timer RC, and Figure 18.1 shows a Timer RC Block Diagram.
Timer RC has three modes.

- Timer mode
  - Input capture function — The counter value is captured to a register, using an external signal as the trigger.
  - Output compare function — Matches between the counter and register values are detected. (Pin output state changes when a match is detected.)

The following two modes use the output compare function.

- PWM mode — Pulses of a given width are output continuously.
- PWM2 mode — A one-shot waveform or PWM waveform is output following the trigger after the wait time has elapsed.

Input capture function, output compare function, and PWM mode settings may be specified independently for each pin.
In PWM2 mode waveforms are output based on a combination of the counter or the register.

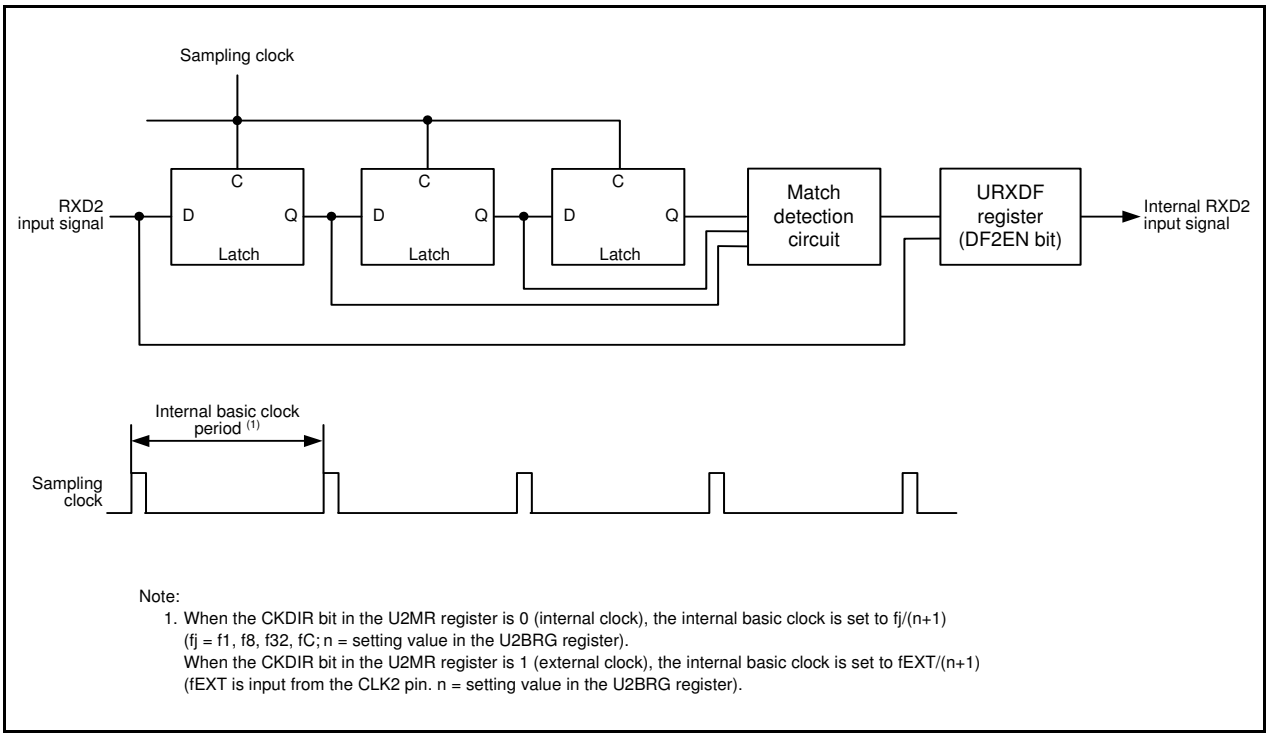
21.6.3 RXD2 Digital Filter Select Function

When the DF2EN bit in the URXDF register is set to 1 (RXD2 digital filer enabled), the RXD2 input signal is loaded internally via the digital filter circuit for noise reduction. The noise canceller consists of three cascaded latch circuits and a match detection circuit. The RXD2 input signal is sampled on the internal basic clock with a frequency 16 times the bit rate. It is recognized as a signal and the level is passed forward to the next circuit when three latch outputs match. When the outputs do not match, the previous value is retained.
In other words, when the level is changed within three clocks, the change is recognized as not a signal but noise.
Figure 21.22 shows a Block Diagram of RXD2 Digital Filter Circuit.



Note:
1. When the CKDIR bit in the U2MR register is 0 (internal clock), the internal basic clock is set to fj/(n+1)
(fj = f1, f8, f32, fC; n = setting value in the U2BRG register).
When the CKDIR bit in the U2MR register is 1 (external clock), the internal basic clock is set to fEXT/(n+1)
(fEXT is input from the CLK2 pin. n = setting value in the U2BRG register).

   Set the PRC3 bit in the PRCR register to 1 (write enabled) before rewriting the OCVREFCR register.

Notes:
1. V_{CC} = 1.8 to 5.5 V at T_{opr} = –20 to 85°C (N version) / –40 to 85°C (D version), unless otherwise specified.
2. The average output current indicates the average value of current measured during 100 ms.
3. fOCO40M can be used as the count source for timer RC in the range of V_{CC} = 2.7 V to 5.5V.
