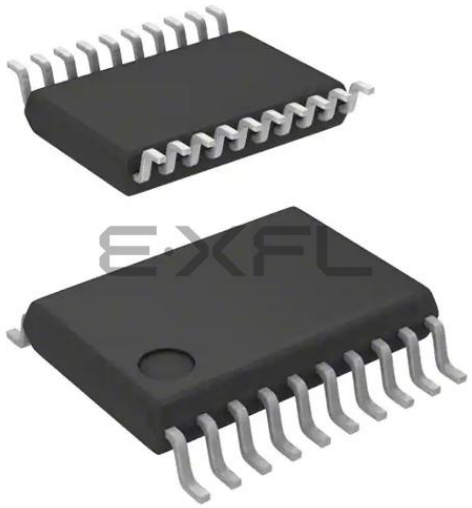
Renesas Electronics America Inc - R5F21324DNSP#U0 Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Not For New Designs
Core Processor	R8C
Core Size	16-Bit
Speed	20MHz
Connectivity	I²C, LINbus, SIO, SSU, UART/USART
Peripherals	POR, PWM, Voltage Detect, WDT
Number of I/O	15
Program Memory Size	16KB (16K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 5.5V
Data Converters	A/D 4x10b
Oscillator Type	Internal
Operating Temperature	-20°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	20-LSSOP (0.173", 4.40mm Width)
Supplier Device Package	20-LSSOP
Purchase URL	https://www.e-xfl.com/product-detail/renesas-electronics-america/r5f21324dnsp-u0

5.1.4 Option Function Select Register 2 (OFS2)

Address 0FFDBh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	WDTRCS1	WDTRCS0	WDTUFS1	WDTUFS0
After Reset	User Setting Value (1)							

Bit	Symbol	Bit Name	Function	R/W
b0	WDTUFS0	Watchdog timer underflow period set bit	b1 b0 0 0: 03FFh 0 1: 0FFFh 1 0: 1FFFh 1 1: 3FFFh	R/W
b1	WDTUFS1			R/W
b2	WDTRCS0	Watchdog timer refresh acknowledgement period set bit	b3 b2 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100%	R/W
b3	WDTRCS1			R/W
b4	—	Reserved bits	Set to 1.	R/W
b5	—			
b6	—			
b7	—			

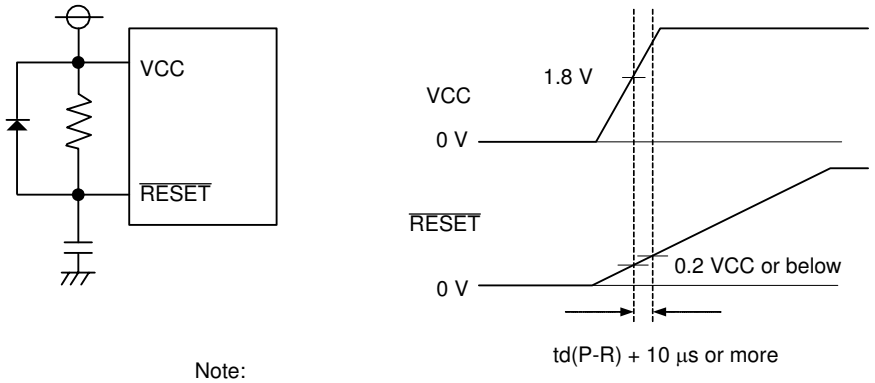
Note:

1. The OFS2 register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.
   Do not write additions to the OFS2 register. If the block including the OFS2 register is erased, the OFS2 register is set to FFh.
   When blank products are shipped, the OFS2 register is set to FFh. It is set to the written value after written by the user.
   When factory-programming products are shipped, the value of the OFS2 register is the value programmed by the user.

   For a setting example of the OFS2 register, refer to **13.3.1 Setting Example of Option Function Select Area**.

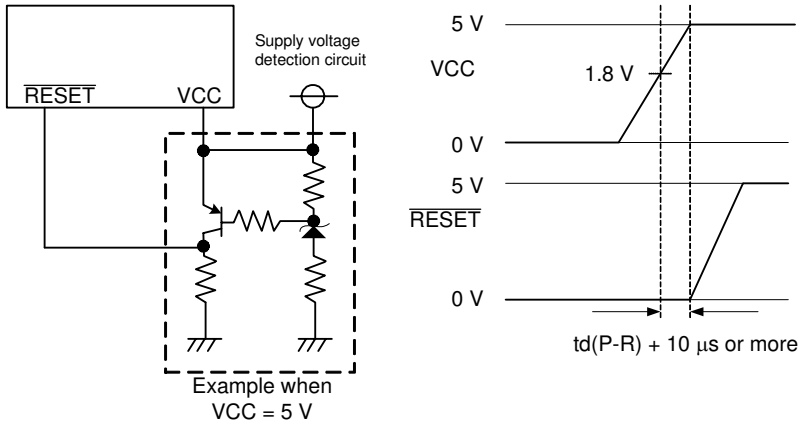
Bits WDTRCS0 and WDTRCS1 (Watchdog Timer Refresh Acknowledgement Period Set Bit)

Assuming that the period from when the watchdog timer starts counting until it underflows is 100%, the refresh acknowledgement period for the watchdog timer can be selected.
For details, refer to **14.3.1.1 Refresh Acknowledgment Period**.



Note:
1. Refer to **26. Electrical Characteristics.**

Figure 5.4 Example of Hardware Reset Circuit and Operation



Note:
1. Refer to **26. Electrical Characteristics.**

Figure 5.5 Example of Hardware Reset Circuit (Usage Example of External Supply Voltage Detection Circuit) and Operation

9.2.10 High-Speed On-Chip Oscillator Control Register 4 (FRA4)

Address 0029h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	When shipping							

Bit	Function	R/W
b7-b0	36.864 MHz frequency correction data is stored. The frequency can be adjusted by transferring this value to the FRA1 register and by transferring the correction value in the FRA5 register to the FRA3 register.	R

9.2.11 High-Speed On-Chip Oscillator Control Register 5 (FRA5)

Address 002Ah

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	When shipping							

Bit	Function	R/W
b7-b0	36.864 MHz frequency correction data is stored. The frequency can be adjusted by transferring this value to the FRA3 register and by transferring the correction value in the FRA4 register to the FRA1 register.	R

9.2.12 High-Speed On-Chip Oscillator Control Register 6 (FRA6)

Address 002Bh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	When shipping							

Bit	Function	R/W
b7-b0	32 MHz frequency correction data is stored. The frequency can be adjusted by transferring this value to the FRA1 register and by transferring the correction value in the FRA7 register to the FRA3 register.	R

9.2.13 High-Speed On-Chip Oscillator Control Register 3 (FRA3)

Address 002Fh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	When shipping							

Bit	Function	R/W
b7-b0	The frequency of the high-speed on-chip oscillator can be adjusted by setting as follows: 40 MHz: FRA1 = value after reset, FRA3 = value after reset 36.864 MHz: Transfer the value in the FRA4 register to the FRA1 register and the value in the FRA5 register to the FRA3 register. 32 MHz: Transfer the value in the FRA6 register to the FRA1 register and the value in the FRA7 register to the FRA3 register.	R/W

Set the PRC0 bit in the PRCR register to 1 (write enabled) before rewriting the FRA3 register.
Also, rewrite the FRA3 register when the FRA00 bit in the FRA0 register is set 0 (high-speed on-chip oscillator off).

12.2 Functions

The ID code areas are used in standard serial I/O mode. Unless 3 bytes (addresses 0FFFCh to 0FFFEh) of the reset vector are set to FFFFFFh, the ID codes stored in the ID code areas and the ID codes sent from the serial programmer or the on-chip debugging emulator are checked to see if they match. If the ID codes match, the commands sent from the serial programmer or the on-chip debugging emulator are acknowledged. If the ID codes do not match, the commands are not acknowledged. To use the serial programmer or the on-chip debugging emulator, first write predetermined ID codes to the ID code areas.
If 3 bytes (addresses 0FFFCh to 0FFFEh) of the reset vector are set to FFFFFFh, the ID codes are not checked and all commands are accepted.

The ID code areas are allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.

The character sequence of the ASCII codes “ALeRASE” is the reserved word used for the forced erase function. The character sequence of the ASCII codes “Protect” is the reserved word used for the standard serial I/O mode disabled function. Table 12.1 shows the ID Code Reserved Word. The reserved word is a set of reserved characters when all the addresses and data in the ID code storage addresses sequentially match Table 12.1. When the forced erase function or standard serial I/O mode disabled function is not used, use another character sequence of the ASCII codes.

Table 12.1 ID Code Reserved Word

ID Code Storage Address		ID Code Reserved Word (ASCII) (1)	
		ALeRASE	Protect
0FFDFh	ID1	41h (upper-case “A”)	50h (upper-case “P”)
0FFE3h	ID2	4Ch (upper-case “L”)	72h (lower-case “r”)
0FFEBh	ID3	65h (lower-case “e”)	6Fh (lower-case “o”)
0FFEFh	ID4	52h (upper-case “R”)	74h (lower-case “t”)
0FFF3h	ID5	41h (upper-case “A”)	65h (lower-case “e”)
0FFF7h	ID6	53h (upper-case “S”)	63h (lower-case “c”)
0FFFBh	ID7	45h (upper-case “E”)	74h (lower-case “t”)

Note:
1. Reserve word: A set of characters when all the addresses and data in the ID code storage addresses sequentially match Table 12.1.

12.3 Forced Erase Function

This function is used in standard serial I/O mode. When the ID codes sent from the serial programmer or the on-chip debugging emulator are "ALeRASE" in ASCII code, the content of the user ROM area will be erased at once. However, if the contents of the ID code addresses are set to other than "ALeRASE" (other than **Table 12.1 ID Code Reserved Word**) when the ROMCR bit in the OFS register is set to 1 and the ROMCP1 bit is set to 0 (ROM code protect enabled), forced erasure is not executed and the ID codes are checked with the ID code check function. Table 12.2 lists the Conditions and Operations of Forced Erase Function.
Also, when the contents of the ID code addresses are set to "ALeRASE" in ASCII code, if the ID codes sent from the serial programmer or the on-chip debugging emulator are "ALeRASE", the content of the user ROM area will be erased. If the ID codes sent from the serial programmer are other than "ALeRASE", the ID codes do not match and no command is acknowledged, thus the user ROM area remains protected.

Table 12.2 Conditions and Operations of Forced Erase Function

Condition			Operation
ID code from serial programmer or the on-chip debugging emulator	ID code in ID code storage address	Bits ROMCP1 and ROMCR in OFS register	
ALeRASE	ALeRASE	–	All erasure of user ROM area (forced erase function)
	Other than ALeRASE (1)	Other than 01b (ROM code protect disabled)	
		01b (ROM code protect enabled)	ID code check (ID code check function)
Other than ALeRASE	ALeRASE	–	ID code check (ID code check function. No ID code match.)
	Other than ALeRASE (1)	–	ID code check (ID code check function)

Note:
1. For "Protect", refer to **12.4 Standard Serial I/O Mode Disabled Function**.

12.4 Standard Serial I/O Mode Disabled Function

This function is used in standard serial I/O mode. When the I/D codes in the ID code storage addresses are set to the reserved character sequence of the ASCII codes "Protect" (refer to **Table 12.1 ID Code Reserved Word**), communication with the serial programmer or the on-chip debugging emulator is not performed. This does not allow the flash memory to be read, rewritten, or erased using the serial programmer or the on-chip debugging emulator.
Also, if the ID codes are also set to the reserved character sequence of the ASCII codes "Protect" when the ROMCR bit in the OFS register is set to 1 and the ROMCP1 bit is set to 0 (ROM code protect enabled), ROM code protection cannot be disabled using the serial programmer or the on-chip debugging emulator. This prevents the flash memory from being read, rewritten, or erased using the serial programmer, the on-chip debugging emulator, or parallel programmer.

13.2.2 Option Function Select Register 2 (OFS2)

Address 0FFDBh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	WDTRCS1	WDTRCS0	WDTUFS1	WDTUFS0
After Reset	User Setting Value (1)							

Bit	Symbol	Bit Name	Function	R/W
b0	WDTUFS0	Watchdog timer underflow period set bit	b1 b0 0 0: 03FFh 0 1: 0FFFh 1 0: 1FFFh 1 1: 3FFFh	R/W
b1	WDTUFS1			R/W
b2	WDTRCS0	Watchdog timer refresh acknowledgement period set bit	b3 b2 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100%	R/W
b3	WDTRCS1			R/W
b4	—	Reserved bits	Set to 1.	R/W
b5	—			
b6	—			
b7	—			

Note:

1. The OFS2 register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.
   Do not write additions to the OFS2 register. If the block including the OFS2 register is erased, the OFS2 register is set to FFh.
   When blank products are shipped, the OFS2 register is set to FFh. It is set to the written value after written by the user.
   When factory-programming products are shipped, the value of the OFS2 register is the value programmed by the user.

   For a setting example of the OFS2 register, refer to **13.3.1 Setting Example of Option Function Select Area**.

Bits WDTRCS0 and WDTRCS1 (Watchdog Timer Refresh Acknowledgement Period Set Bit)

Assuming that the period from when the watchdog timer starts counting until it underflows is 100%, the refresh acknowledgement period for the watchdog timer can be selected.
For details, refer to **14.3.1.1 Refresh Acknowledgment Period**.

14.3.2 Count Source Protection Mode Disabled

The count source for the watchdog timer is the CPU clock when count source protection mode is disabled. Table 14.2 lists the Watchdog Timer Specifications (Count Source Protection Mode Disabled).

Table 14.2 Watchdog Timer Specifications (Count Source Protection Mode Disabled)

Item	Specification
Count source	CPU clock
Count operation	Decrement
Period	$\frac{\text{Division ratio of prescaler (n)} \times \text{count value of watchdog timer (m)}}{\text{CPU clock}}$ (1) n: 16 or 128 (selected by the WDTC7 bit in the WDTC register), or 2 when selecting the low-speed clock (CM07 bit in CM0 register = 1) m: Value set by bits WDTUFS0 and WDTUFS1 in the OFS2 register Example: The period is approximately 13.1 ms when: - The CPU clock frequency is set to 20 MHz. - The prescaler is divided by 16. - Bits WDTUFS1 to WDTUFS0 are set to 11b (3FFFh).
Watchdog timer initialization conditions	• Reset • Write 00h and then FFh to the WDTR register. (3) • Underflow
Count start conditions	The operation of the watchdog timer after a reset is selected by the WDTON bit (2) in the OFS register (address 0FFFFh). • When the WDTON bit is set to 1 (watchdog timer is stopped after reset). The watchdog timer and prescaler are stopped after a reset and start counting when the WDTS register is written to. • When the WDTON bit is set to 0 (watchdog timer starts automatically after reset). The watchdog timer and prescaler start counting automatically after a reset.
Count stop condition	Stop mode, wait mode (Count resumes from the retained value after exiting.)
Operations at underflow	• When the PM12 bit in the PM1 register is set to 0. Watchdog timer interrupt • When the PM12 bit in the PM1 register is set to 1. Watchdog timer reset (refer to **5.5 Watchdog Timer Reset**)

Notes:
1. The watchdog timer is initialized when 00h and then FFh is written to the WDTR register. The prescaler is initialized after a reset. This may cause some errors due to the prescaler during the watchdog timer period.
2. The WDTON bit cannot be changed by a program. To set this bit, write 0 to bit 0 of address 0FFFFh with a flash programmer.
3. Write the WDTR register during the count operation of the watchdog timer.

Table 15.1 Functional Comparison of Timers

Item		Timer RA	Timer RB	Timer RC	Timer RE
Configuration		8-bit timer with 8-bit prescaler (with reload register)	8-bit timer with 8-bit prescaler (with reload register)	16-bit timer (with input capture and output compare)	4-bit counter 8-bit counter
Count		Decrement	Decrement	Increment	Increment
Count sources		• f1 • f2 • f8 • fOCO • fC32 • fC	• f1 • f2 • f8 • Timer RA underflow	• f1 • f2 • f4 • f8 • f32 • fOCO40M • fOCO-F • TRCCLK	• f4 • f8 • f32 • fC4
Function	Count of the internal count source	Timer mode	Timer mode	Timer mode (output compare function)	—
	Count of the external count source	Event counter mode	—	Timer mode (output compare function)	—
	External pulse width/ period measurement	Pulse width measurement mode, pulse period measurement mode	—	Timer mode (input capture function; 4 pins)	—
	PWM output	Pulse output mode (1), Event counter mode (1)	Programmable waveform generation mode	Timer mode (output compare function; 4 pins) (1), PWM mode (3 pins), PWM2 mode (1 pin)	—
	One-shot waveform output	—	Programmable one-shot generation mode, Programmable wait one-shot generation mode	PWM mode (3 pins)	—
	Three-phase waveforms output	—	—	—	—
	Timer	Timer mode (only fC32 count)	—	—	Real-time clock mode
Input pin		TRAIO	$\overline{\text{INT0}}$	$\overline{\text{INT0}}$, TRCCLK, TRCTRG, TRCIOA, TRCIOB, TRCIOC, TRCIOD	—
Output pin		TRAO TRAIO	TRBO	TRCIOA, TRCIOB, TRCIOC, TRCIOD	—
Related interrupt		Timer RA interrupt	Timer RB interrupt, INT0 interrupt	Compare match/input capture A to D interrupt, Overflow interrupt, INT0 interrupt	Timer RE interrupt
Timer stop		Provided	Provided	Provided	Provided

Note:
1. Rectangular waves are output in these modes. Since the waves are inverted at each overflow, the “H” and “L” level widths of the pulses are the same.

17.3 Timer Mode

In timer mode, a count source which is internally generated or timer RA underflows are counted (refer to **Table 17.2 Timer Mode Specifications**). Registers TRBOCR and TRBSC are not used in timer mode.

Table 17.2 Timer Mode Specifications

Item	Specification
Count sources	f1, f2, f8, timer RA underflow
Count operations	• Decrement • When the timer underflows, it reloads the reload register contents before the count continues (when timer RB underflows, the contents of timer RB primary reload register is reloaded).
Divide ratio	1/(n+1)(m+1) n: setting value in TRBPRE register, m: setting value in TRBPR register
Count start condition	1 (count starts) is written to the TSTART bit in the TRBCR register.
Count stop conditions	• 0 (count stops) is written to the TSTART bit in the TRBCR register. • 1 (count forcibly stop) is written to the TSTOP bit in the TRBCR register.
Interrupt request generation timing	When timer RB underflows [timer RB interrupt].
TRBO pin function	Programmable I/O port
$\overline{\text{INT0}}$ pin function	Programmable I/O port or $\overline{\text{INT0}}$ interrupt input
Read from timer	The count value can be read out by reading registers TRBPR and TRBPRE.
Write to timer	• When registers TRBPRE and TRBPR are written while the count is stopped, values are written to both the reload register and counter. • When registers TRBPRE and TRBPR are written to while count operation is in progress: If the TWRC bit in the TRBMR register is set to 0, the value is written to both the reload register and the counter. If the TWRC bit is set to 1, the value is written to the reload register only. (Refer to **17.3.2 Timer Write Control during Count Operation**.)

17.3.1 Timer RB I/O Control Register (TRBIOC) in Timer Mode

Address 010Ah

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	INOSEG	INOSTG	TOCNT	TOPL
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TOPL	Timer RB output level select bit	Set to 0 in timer mode.	R/W
b1	TOCNT	Timer RB output switch bit		R/W
b2	INOSTG	One-shot trigger control bit		R/W
b3	INOSEG	One-shot trigger polarity select bit		R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b5	—			
b6	—			
b7	—			

18.4.2 Timer RC I/O Control Register 1 (TRCIOR1) for Input Capture Function

Address 0125h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	IOD3	IOD2	IOD1	IOD0	IOC3	IOC2	IOC1	IOC0
After Reset	1	0	0	0	1	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	IOC0	TRCGRC control bit	b1 b0 0 0: Input capture to the TRCGRC register at the rising edge 0 1: Input capture to the TRCGRC register at the falling edge 1 0: Input capture to the TRCGRC register at both edges 1 1: Do not set.	R/W
b1	IOC1			R/W
b2	IOC2	TRCGRC mode select bit (1)	Set to 1 (input capture) in the input capture function.	R/W
b3	IOC3	TRCGRC register function select bit	Set to 1.	R/W
b4	IOD0	TRCGRD control bit	b5 b4 0 0: Input capture to the TRCGRD register at the rising edge 0 1: Input capture to the TRCGRD register at the falling edge 1 0: Input capture to the TRCGRD register at both edges 1 1: Do not set.	R/W
b5	IOD1			R/W
b6	IOD2	TRCGRD mode select bit (2)	Set to 1 (input capture) in the input capture function.	R/W
b7	IOD3	TRCGRD register function select bit	Set to 1.	R/W

Notes:
1. When the BFC bit in the TRCMR register is set to 1 (buffer register of TRCGRA register), set the IOC2 bit in the TRCIOR1 register to the same value as the IOA2 bit in the TRCIOR0 register.
2. When the BFD bit in the TRCMR register is set to 1 (buffer register of TRCGRB register), set the IOD2 bit in the TRCIOR1 register to the same value as the IOB2 bit in the TRCIOR0 register.

Table 18.8 Functions of TRCGRj Register when Using Input Capture Function

Register	Setting	Register Function	Input Capture Input Pin
TRCGRA	–	General register. Can be used to read the TRC register value at input capture.	TRCIOA
TRCGRB			TRCIOB
TRCGRC	BFC = 0	General register. Can be used to read the TRC register value at input capture.	TRCIOC
TRCGRD	BFD = 0		TRCIOD
TRCGRC	BFC = 1	Buffer registers. Can be used to hold transferred value from the general register. (Refer to **18.3.2 Buffer Operation**.)	TRCIOA
TRCGRD	BFD = 1		TRCIOB

j = A, B, C, or D
BFC, BFD: Bits in TRCMR register

18.5.4 Timer RC Control Register 2 (TRCCR2) for Output Compare Function

Address 0130h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TCEG1	TCEG0	CSEL	—	—	POLD	POLC	POLB
After Reset	0	0	0	1	1	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	POLB	PWM mode output level control bit B (1)	0: TRCIOB output level selected as “L” active 1: TRCIOB output level selected as “H” active	R/W
b1	POLC	PWM mode output level control bit C (1)	0: TRCIOC output level selected as “L” active 1: TRCIOC output level selected as “H” active	R/W
b2	POLD	PWM mode output level control bit D (1)	0: TRCIOD output level selected as “L” active 1: TRCIOD output level selected as “H” active	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 1.		—
b4	—			
b5	CSEL	TRC count operation select bit (2)	0: Count continues at compare match with the TRCGRA register 1: Count stops at compare match with the TRCGRA register	R/W
b6	TCEG0	TRCTRG input edge select bit (3)	b7 b6 0 0: Disable the trigger input from the TRCTRG pin 0 1: Rising edge selected 1 0: Falling edge selected 1 1: Both edges selected	R/W
b7	TCEG1			R/W

Notes:
1. Enabled when in PWM mode.
2. Enabled when in output compare function, PWM mode, or PWM2 mode. For notes on PWM2 mode, refer to **18.9.6 TRCMR Register in PWM2 Mode**.
3. Enabled when in PWM2 mode.

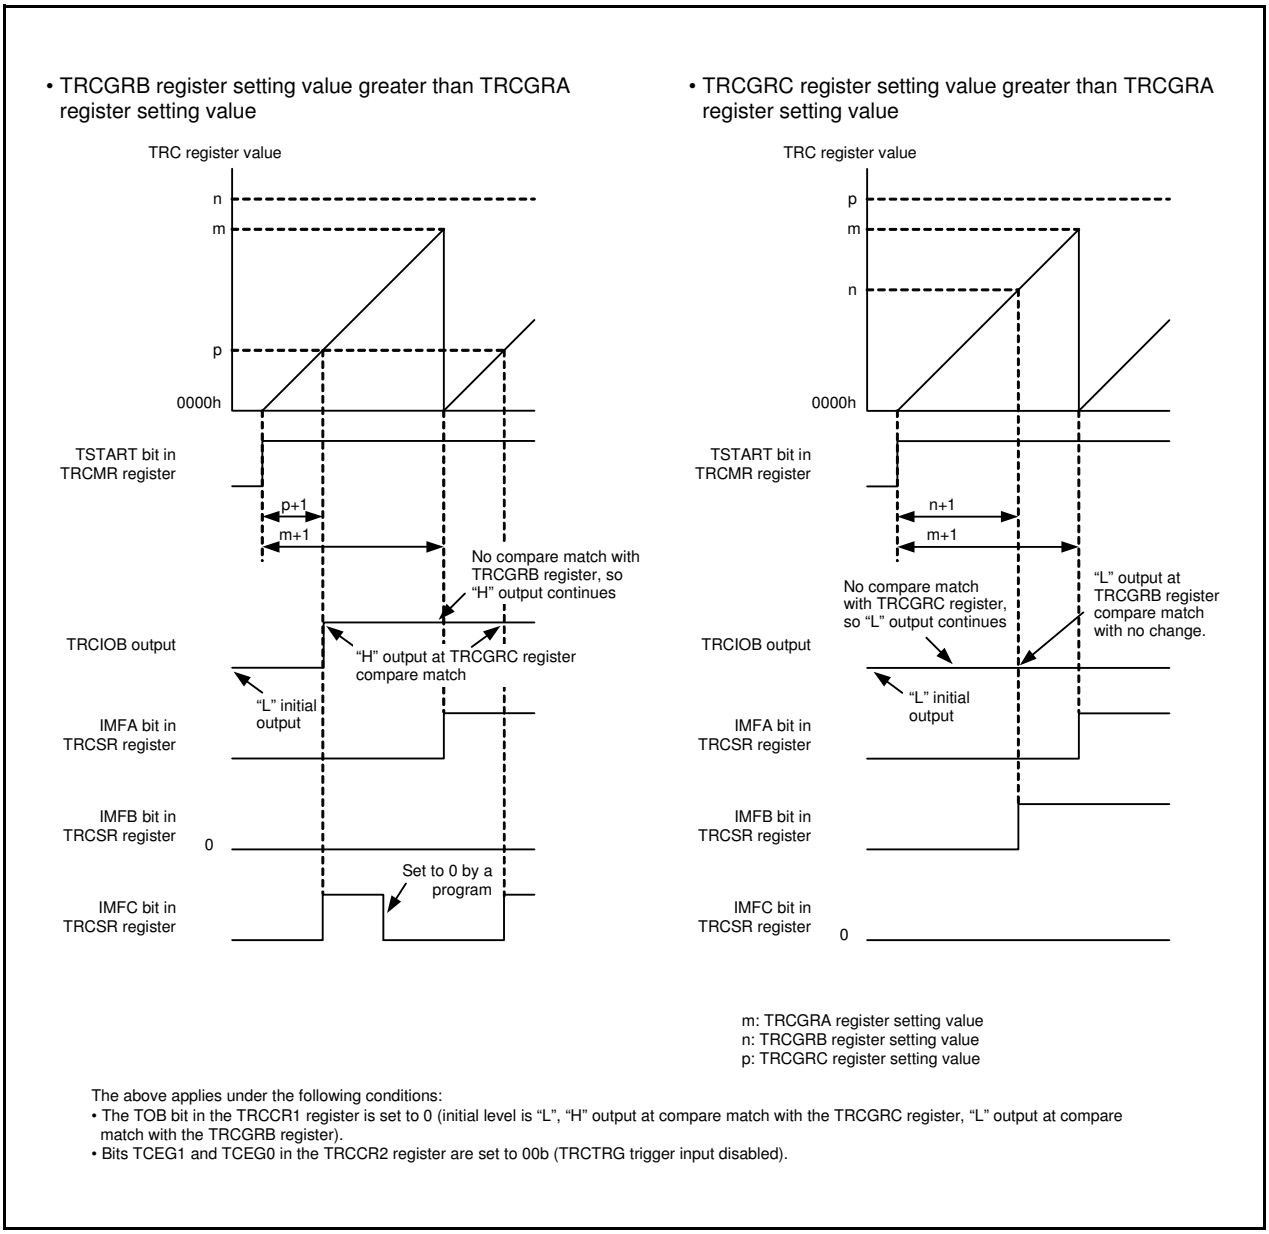


Figure 18.19 Operating Example of PWM2 Mode (Duty 0% and Duty 100%)

19.3.3 Time Reading Procedure of Real-Time Clock Mode

In real-time clock mode, read registers TRESEC, TREMIN, TREHR, and TREWK when time data is updated and read the PM bit in the TRECR1 register when the BSY bit is set to 0 (not while data is updated).
Also, when reading several registers, an incorrect time will be read if data is updated before another register is read after reading any register.

In order to prevent this, use the reading procedure shown below.

- Using an interrupt
  Read necessary contents of registers TRESEC, TREMIN, TREHR, and TREWK and the PM bit in the TRECR1 register in the timer RE interrupt routine.

- Monitoring with a program 1
  Monitor the IR bit in the TREIC register with a program and read necessary contents of registers TRESEC, TREMIN, TREHR, and TREWK and the PM bit in the TRECR1 register after the IR bit in the TREIC register is set to 1 (timer RE interrupt request generated).

- Monitoring with a program 2

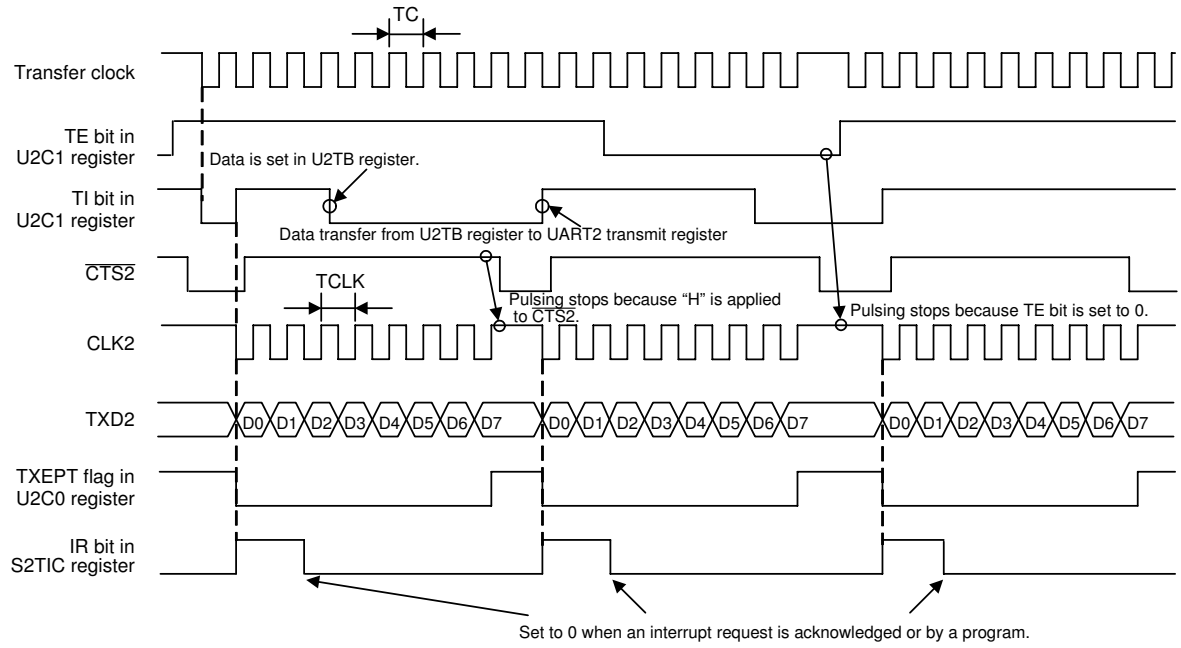
(1) Monitor the BSY bit.
(2) Monitor until the BSY bit is set to 0 after the BSY bit is set to 1 (approximately 62.5 ms while the BSY bit is set to 1).
(3) Read necessary contents of registers TRESEC, TREMIN, TREHR, and TREWK and the PM bit in the TRECR1 register after the BSY bit is set to 0.

- Using read results if they are the same value twice

(1) Read necessary contents of registers TRESEC, TREMIN, TREHR, and TREWK and the PM bit in the TRECR1 register.
(2) Read the same register as (1) and compare the contents.
(3) Recognize as the correct value if the contents match. If the contents do not match, repeat until the read contents match with the previous contents.

Also, when reading several registers, read them as continuously as possible.

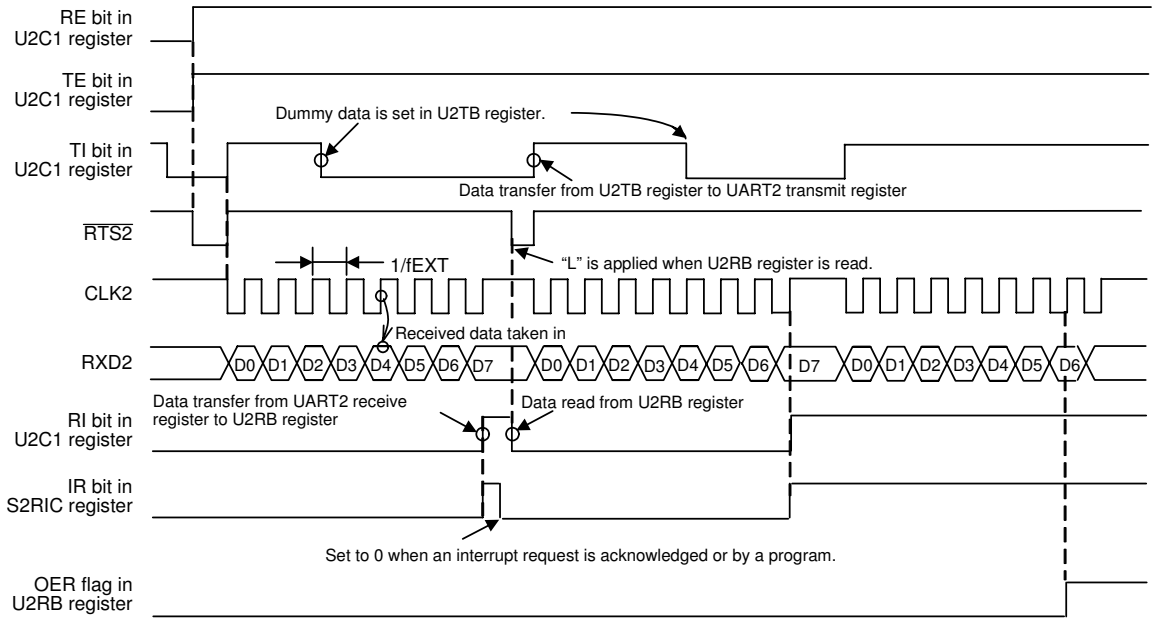
(1) Transmit Timing Example (Internal Clock Selected)



The above applies when:
- CKDIR bit in U2MR register = 0 (internal clock)
- CRD bit in U2C0 register = 0 (CTS/RTS function enabled), CRS bit = 0 (CTS function selected)
- CKPOL bit in U2C0 register = 0 (transmit data output at the falling edge and receive data input at the rising edge of the transfer clock)
- U2IRS bit in U2C1 register = 0 (interrupt request generation when the U2TB register is empty)

TC = TCLK = 2(n+1)/fj
fj: Frequency of U2BRG count source (f1, f8, f32, fC)
n: Setting value in U2BRG register

(2) Receive Timing Example (External Clock Selected)



The above applies when:
- CKDIR bit in U2MR register = 1 (external clock)
- CRD bit in U2C0 register = 0 (CTS/RTS function enabled), CRS bit = 1 (RTS function selected)
- CKPOL bit in U2C0 register = 0 (transmit data output at the falling edge and receive data input at the rising edge of the transfer clock)

Make sure the following conditions are met when the CLK2 pin input before receiving data is high:
- TE bit in U2C0 register = 1 (transmission enabled)
- RE bit in U2C1 register = 1 (reception enabled)
- Dummy data is written to U2TB register

fEXT: Frequency of external clock

Figure 21.3 Transmit and Receive Timing in Clock Synchronous Serial I/O Mode

23.2 Registers

23.2.1 Comparator B Control Register (INTCMP)

Address 01F8h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	INT3COUT	—	—	INT3CP0	INT1COUT	—	—	INT1CP0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	INT1CP0	Comparator B1 operation enable bit	0: Comparator B1 operation disabled 1: Comparator B1 operation enabled	R/W
b1	—	Reserved bits	Set to 0.	R/W
b2	—			
b3	INT1COUT	Comparator B1 monitor flag	0: IVCMP1 < IVREF1 or comparator B1 operation disabled 1: IVCMP1 > IVREF1	R
b4	INT3CP0	Comparator B3 operation enable bit	0: Comparator B3 operation disabled 1: Comparator B3 operation enabled	R/W
b5	—	Reserved bits	Set to 0.	R/W
b6	—			
b7	INT3COUT	Comparator B3 monitor flag	0: IVCMP3 < IVREF3 or comparator B3 operation disabled 1: IVCMP3 > IVREF3	R

23.2.2 External Input Enable Register 0 (INTEN)

Address 01FAh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	INT3PL	INT3EN	—	—	INT1PL	INT1EN	INT0PL	INT0EN
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	INT0EN	$\overline{\text{INT0}}$ input enable bit	0: Disabled 1: Enabled	R/W
b1	INT0PL	$\overline{\text{INT0}}$ input polarity select bit (1, 2)	0: One edge 1: Both edges	R/W
b2	INT1EN	$\overline{\text{INT1}}$ input enable bit	0: Disabled 1: Enabled	R/W
b3	INT1PL	$\overline{\text{INT1}}$ input polarity select bit (1, 2)	0: One edge 1: Both edges	R/W
b4	—	Reserved bits	Set to 0.	R/W
b5	—			
b6	INT3EN	$\overline{\text{INT3}}$ input enable bit	0: Disabled 1: Enabled	R/W
b7	INT3PL	$\overline{\text{INT3}}$ input polarity select bit (1, 2)	0: One edge 1: Both edges	R/W

Notes:
1. To set the INTiPL bit (i = 0, 1, 3) to 1 (both edges), set the POL bit in the INTiIC register to 0 (falling edge selected).
2. The IR bit in the INTiIC register may be set to 1 (interrupt requested) if the INTEN register is rewritten. Refer to **11.8.4 Changing Interrupt Sources**.

26. Electrical Characteristics

Table 26.1 Absolute Maximum Ratings

Symbol	Parameter	Condition	Rated Value	Unit
V_{CC}/AV_{CC}	Supply voltage		−0.3 to 6.5	V
V_I	Input voltage		−0.3 to V_{CC} + 0.3	V
V_O	Output voltage		−0.3 to V_{CC} + 0.3	V
P_d	Power dissipation	−40°C ≤ T_{opr} ≤ 85°C	500	mW
T_{opr}	Operating ambient temperature		−20 to 85 (N version) / −40 to 85 (D version)	°C
T_{stg}	Storage temperature		−65 to 150	°C

Table 26.5 Flash Memory (Program ROM) Electrical Characteristics

Symbol	Parameter	Conditions	Standard			Unit
			Min.	Typ.	Max.	
–	Program/erase endurance (2)		1,000 (3)	–	–	times
–	Byte program time		–	80	500	µs
–	Block erase time		–	0.3	–	s
$t_{d(SR-SUS)}$	Time delay from suspend request until suspend		–	–	5 + CPU clock × 3 cycles	ms
–	Interval from erase start/restart until following suspend request		0	–	–	µs
–	Time from suspend until erase restart		–	–	30 + CPU clock × 1 cycle	µs
$t_{d(CMDRST-READY)}$	Time from when command is forcibly stopped until reading is enabled		–	–	30+CPU clock × 1 cycle	µs
–	Program, erase voltage		2.7	–	5.5	V
–	Read voltage		1.8	–	5.5	V
–	Program, erase temperature		0	–	60	°C
–	Data hold time (7)	Ambient temperature = 55°C	20	–	–	year

Notes:
1. V_{CC} = 2.7 to 5.5 V at T_{opr} = 0 to 60°C, unless otherwise specified.
2. Definition of programming/erasure endurance
   The programming and erasure endurance is defined on a per-block basis.
   If the programming and erasure endurance is n (n = 1,000), each block can be erased n times. For example, if 1,024 1-byte writes are performed to different addresses in block A, a 1 Kbyte block, and then the block is erased, the programming/erasure endurance still stands at one.
   However, the same address must not be programmed more than once per erase operation (overwriting prohibited).
3. Endurance to guarantee all electrical characteristics after program and erase. (1 to Min. value can be guaranteed).
4. In a system that executes multiple programming operations, the actual erasure count can be reduced by writing to sequential addresses in turn so that as much of the block as possible is used up before performing an erase operation. For example, when programming groups of 16 bytes, the effective number of rewrites can be minimized by programming up to 128 groups before erasing them all in one operation. It is also advisable to retain data on the erasure endurance of each block and limit the number of erase operations to a certain number.
5. If an error occurs during block erase, attempt to execute the clear status register command, then execute the block erase command at least three times until the erase error does not occur.
6. Customers desiring program/erase failure rate information should contact their Renesas technical support representative.
7. The data hold time includes time that the power supply is off or the clock is not supplied.

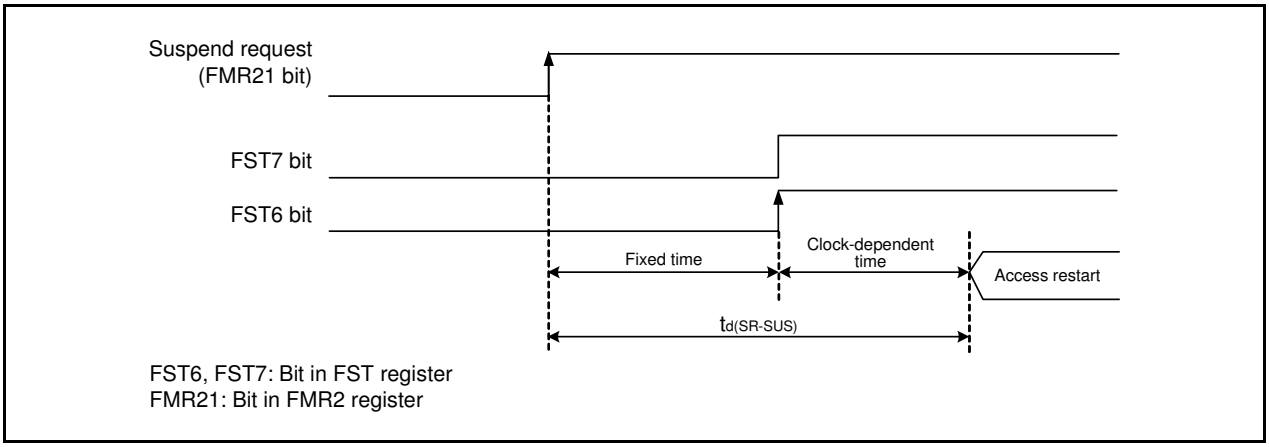


Figure 26.2 Time delay until Suspend

Table 27.2 CPU Rewrite Mode Interrupts (2)

Mode	Erase/ Write Target	Status	• Watchdog Timer • Oscillation Stop Detection • Voltage Monitor 2 • Voltage Monitor 1 • NMI (Note 1)	• Undefined Instruction • INTO Instruction • BRK Instruction • Single Step • Address Match • Address Break (Note 1)
EW0	Program ROM	During auto-erasure (suspend enabled)	When an interrupt request is acknowledged, auto-erasure or auto-programming is forcibly stopped immediately and the flash memory is reset. Interrupt handling starts when the flash memory restarts after the fixed period. Since the block during auto-erasure or the address during auto-programming is forcibly stopped, the normal value may not be read. After the flash memory restarts, execute auto-erasure again and ensure it completes normally. The watchdog timer does not stop during the command operation, so interrupt requests may be generated. Initialize the watchdog timer regularly using the erase-suspend function.	Not usable during auto-erasure or auto-programming.
		During auto-erasure (suspend disabled)		
		During auto-programming		
EW1	Program ROM	During auto-erasure (suspend enabled)	When an interrupt request is acknowledged, auto-erasure or auto-programming is forcibly stopped immediately and the flash memory is reset. Interrupt handling starts when the flash memory restarts after the fixed period. Since the block during auto-erasure or the address during auto-programming is forcibly stopped, the normal value may not be read. After the flash memory restarts, execute auto-erasure again and ensure it completes normally. The watchdog timer does not stop during the command operation, so interrupt requests may be generated. Initialize the watchdog timer regularly using the erase-suspend function.	Not usable during auto-erasure or auto-programming.
		During auto-erasure (suspend disabled or FMR22 = 0)		
		During auto-programming		

FMR21, FMR22: Bits in FMR2 register

Note:

1. Do not use a non-maskable interrupt while block 0 is being auto-erased because the fixed vector is allocated in block 0.
