

Welcome to [E-XFL.COM](http://E-XFL.COM)

### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	708
Number of Gates	-
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	1020-BBGA
Supplier Device Package	1020-FBGA (33x33)
Purchase URL	<a href="https://www.e-xfl.com/pro/item?MUrl=&amp;PartUrl=ep20k1000efc33-1">https://www.e-xfl.com/pro/item?MUrl=&amp;PartUrl=ep20k1000efc33-1</a>

APEX 20K devices provide two dedicated clock pins and four dedicated input pins that drive register control inputs. These signals ensure efficient distribution of high-speed, low-skew control signals. These signals use dedicated routing channels to provide short delays and low skews. Four of the dedicated inputs drive four global signals. These four global signals can also be driven by internal logic, providing an ideal solution for a clock divider or internally generated asynchronous clear signals with high fan-out. The dedicated clock pins featured on the APEX 20K devices can also feed logic. The devices also feature ClockLock and ClockBoost clock management circuitry. APEX 20KE devices provide two additional dedicated clock pins, for a total of four dedicated clock pins.

### MegaLAB Structure

APEX 20K devices are constructed from a series of MegaLAB™ structures. Each MegaLAB structure contains a group of logic array blocks (LABs), one ESB, and a MegaLAB interconnect, which routes signals within the MegaLAB structure. The EP20K30E device has 10 LABs, EP20K60E through EP20K600E devices have 16 LABs, and the EP20K1000E and EP20K1500E devices have 24 LABs. Signals are routed between MegaLAB structures and I/O pins via the FastTrack Interconnect. In addition, edge LABs can be driven by I/O pins through the local interconnect. Figure 2 shows the MegaLAB structure.

Figure 2. MegaLAB Structure

## Logic Array Block

Each LAB consists of 10 LEs, the LEs' associated carry and cascade chains, LAB control signals, and the local interconnect. The local interconnect transfers signals between LEs in the same or adjacent LABs, IOEs, or ESBs. The Quartus II Compiler places associated logic within an LAB or adjacent LABs, allowing the use of a fast local interconnect for high performance. Figure 3 shows the APEX 20K LAB.

APEX 20K devices use an interleaved LAB structure. This structure allows each LE to drive two local interconnect areas. This feature minimizes use of the MegaLAB and FastTrack interconnect, providing higher performance and flexibility. Each LE can drive 29 other LEs through the fast local interconnect.

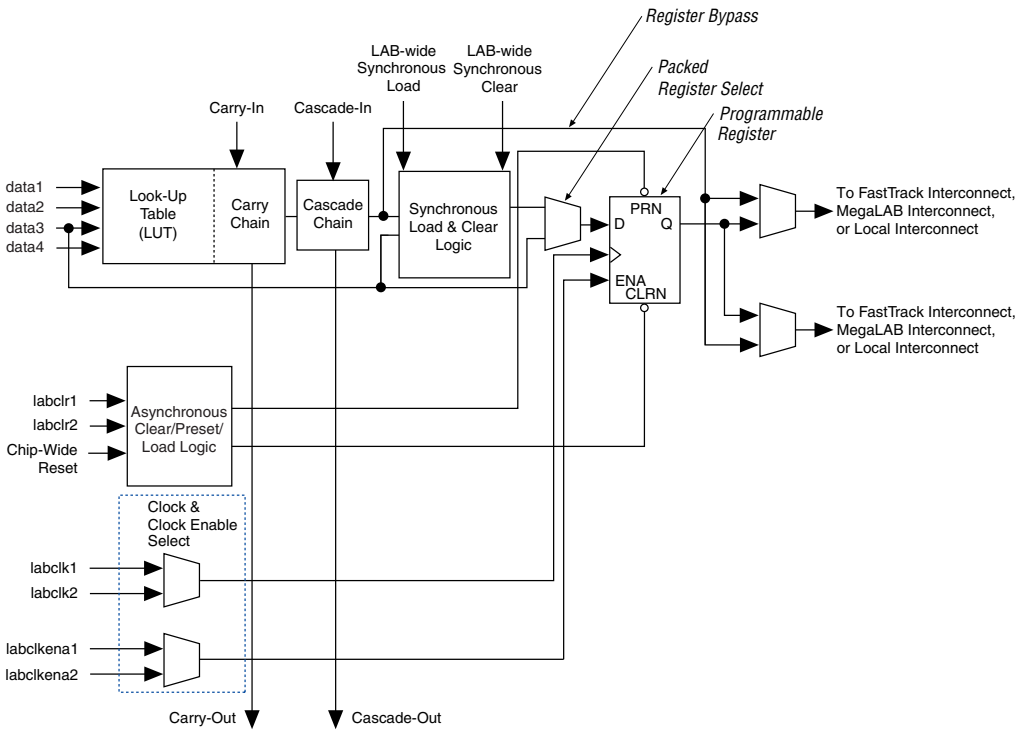

Figure 3. LAB Structure

## Logic Element

The LE, the smallest unit of logic in the APEX 20K architecture, is compact and provides efficient logic usage. Each LE contains a four-input LUT, which is a function generator that can quickly implement any function of four variables. In addition, each LE contains a programmable register and carry and cascade chains. Each LE drives the local interconnect, MegaLAB interconnect, and FastTrack Interconnect routing structures. See [Figure 5](#).

**Figure 5. APEX 20K Logic Element**

Each LE's programmable register can be configured for D, T, JK, or SR operation. The register's clock and clear control signals can be driven by global signals, general-purpose I/O pins, or any internal logic. For combinational functions, the register is bypassed and the output of the LUT drives the outputs of the LE.

Each LE has two outputs that drive the local, MegaLAB, or FastTrack Interconnect routing structure. Each output can be driven independently by the LUT's or register's output. For example, the LUT can drive one output while the register drives the other output. This feature, called register packing, improves device utilization because the register and the LUT can be used for unrelated functions. The LE can also drive out registered and unregistered versions of the LUT output.

The APEX 20K architecture provides two types of dedicated high-speed data paths that connect adjacent LEs without using local interconnect paths: carry chains and cascade chains. A carry chain supports high-speed arithmetic functions such as counters and adders, while a cascade chain implements wide-input functions such as equality comparators with minimum delay. Carry and cascade chains connect LEs 1 through 10 in an LAB and all LABs in the same MegaLAB structure.

### *Carry Chain*

The carry chain provides a very fast carry-forward function between LEs. The carry-in signal from a lower-order bit drives forward into the higher-order bit via the carry chain, and feeds into both the LUT and the next portion of the carry chain. This feature allows the APEX 20K architecture to implement high-speed counters, adders, and comparators of arbitrary width. Carry chain logic can be created automatically by the Quartus II software Compiler during design processing, or manually by the designer during design entry. Parameterized functions such as library of parameterized modules (LPM) and DesignWare functions automatically take advantage of carry chains for the appropriate functions.

The Quartus II software Compiler creates carry chains longer than ten LEs by linking LABs together automatically. For enhanced fitting, a long carry chain skips alternate LABs in a MegaLAB™ structure. A carry chain longer than one LAB skips either from an even-numbered LAB to the next even-numbered LAB, or from an odd-numbered LAB to the next odd-numbered LAB. For example, the last LE of the first LAB in the upper-left MegaLAB structure carries to the first LE of the third LAB in the MegaLAB structure.

Figure 6 shows how an  $n$ -bit full adder can be implemented in  $n + 1$  LEs with the carry chain. One portion of the LUT generates the sum of two bits using the input signals and the carry-in signal; the sum is routed to the output of the LE. The register can be bypassed for simple adders or used for accumulator functions. Another portion of the LUT and the carry chain logic generates the carry-out signal, which is routed directly to the carry-in signal of the next-higher-order bit. The final carry-out signal is routed to an LE, where it is driven onto the local, MegaLAB, or FastTrack Interconnect routing structures.

The programmable register also supports an asynchronous clear function. Within the ESB, two asynchronous clears are generated from global signals and the local interconnect. Each macrocell can either choose between the two asynchronous clear signals or choose to not be cleared. Either of the two clear signals can be inverted within the ESB. Figure 15 shows the ESB control logic when implementing product-terms.

Figure 15. ESB Product-Term Mode Control Logic

Note to Figure 15:

(1) APEX 20KE devices have four dedicated clocks.

### Parallel Expanders

Parallel expanders are unused product terms that can be allocated to a neighboring expanders to implement fast, complex logic functions. Parallel expanders allow up to 32 product terms to feed the macrocell OR logic directly, with two product terms provided by the macrocell and 30 parallel expanders provided by the neighboring macrocells in the ESB.

The Quartus II software Compiler can allocate up to 15 sets of up to two parallel expanders per set to the macrocells automatically. Each set of two parallel expanders incurs a small, incremental timing delay. Figure 16 shows the APEX 20K parallel expanders.

**Figure 18. Deep Memory Block Implemented with Multiple ESBs**

The ESB implements two forms of dual-port memory: read/write clock mode and input/output clock mode. The ESB can also be used for bidirectional, dual-port memory applications in which two ports read or write simultaneously. To implement this type of dual-port memory, two or four ESBs are used to support two simultaneous reads or writes. This functionality is shown in [Figure 19](#).

**Figure 19. APEX 20K ESB Implementing Dual-Port RAM**

## Read/Write Clock Mode

The read/write clock mode contains two clocks. One clock controls all registers associated with writing: data input, WE, and write address. The other clock controls all registers associated with reading: read enable (RE), read address, and data output. The ESB also supports clock enable and asynchronous clear signals; these signals also control the read and write registers independently. Read/write clock mode is commonly used for applications where reads and writes occur at different system frequencies. Figure 20 shows the ESB in read/write clock mode.

Figure 20. ESB in Read/Write Clock Mode Note (1)

Notes to Figure 20:

- (1) All registers can be cleared asynchronously by ESB local interconnect signals, global signals, or the chip-wide reset.
- (2) APEX 20KE devices have four dedicated clocks.

## Implementing Logic in ROM

In addition to implementing logic with product terms, the ESB can implement logic functions when it is programmed with a read-only pattern during configuration, creating a large LUT. With LUTs, combinatorial functions are implemented by looking up the results, rather than by computing them. This implementation of combinatorial functions can be faster than using algorithms implemented in general logic, a performance advantage that is further enhanced by the fast access times of ESBs. The large capacity of ESBs enables designers to implement complex functions in one logic level without the routing delays associated with linked LEs or distributed RAM blocks. Parameterized functions such as LPM functions can take advantage of the ESB automatically. Further, the Quartus II software can implement portions of a design with ESBs where appropriate.

## Programmable Speed/Power Control

APEX 20K ESBs offer a high-speed mode that supports very fast operation on an ESB-by-ESB basis. When high speed is not required, this feature can be turned off to reduce the ESB's power dissipation by up to 50%. ESBs that run at low power incur a nominal timing delay adder. This Turbo Bit™ option is available for ESBs that implement product-term logic or memory functions. An ESB that is not used will be powered down so that it does not consume DC current.

Designers can program each ESB in the APEX 20K device for either high-speed or low-power operation. As a result, speed-critical paths in the design can run at high speed, while the remaining paths operate at reduced power.

## I/O Structure

The APEX 20K IOE contains a bidirectional I/O buffer and a register that can be used either as an input register for external data requiring fast setup times, or as an output register for data requiring fast clock-to-output performance. IOEs can be used as input, output, or bidirectional pins. For fast bidirectional I/O timing, LE registers using local routing can improve setup times and OE timing. The Quartus II software Compiler uses the programmable inversion option to invert signals from the row and column interconnect automatically where appropriate. Because the APEX 20K IOE offers one output enable per pin, the Quartus II software Compiler can emulate open-drain operation efficiently.

The APEX 20K IOE includes programmable delays that can be activated to ensure zero hold times, minimum clock-to-output times, input IOE register-to-core register transfers, or core-to-output IOE register transfers. A path in which a pin directly drives a register may require the delay to ensure zero hold time, whereas a path in which a pin drives a register through combinatorial logic may not require the delay.

**Figure 29. APEX 20KE I/O Banks**

**Notes to Figure 29:**

- (1) For more information on placing I/O pins in LVDS blocks, refer to the *Guidelines for Using LVDS Blocks* section in *Application Note 120 (Using LVDS in APEX 20KE Devices)*.
- (2) If the LVDS input and output blocks are not used for LVDS, they can support all of the I/O standards and can be used as input, output, or bidirectional pins with  $V_{CCIO}$  set to 3.3 V, 2.5 V, or 1.8 V.

**Power Sequencing & Hot Socketing**

Because APEX 20K and APEX 20KE devices can be used in a mixed-voltage environment, they have been designed specifically to tolerate any possible power-up sequence. Therefore, the  $V_{CCIO}$  and  $V_{CCINT}$  power supplies may be powered in any order.

For more information, please refer to the “Power Sequencing Considerations” section in the *Configuring APEX 20KE & APEX 20KC Devices* chapter of the *Configuration Devices Handbook*.

Signals can be driven into APEX 20K devices before and during power-up without damaging the device. In addition, APEX 20K devices do not drive out during power-up. Once operating conditions are reached and the device is configured, APEX 20K and APEX 20KE devices operate as specified by the user.

**Table 15. APEX 20K ClockLock & ClockBoost Parameters for -1 Speed-Grade Devices (Part 2 of 2)**

Symbol	Parameter	Min	Max	Unit
$t_{\text{SKEW}}$	Skew delay between related ClockLock/ClockBoost-generated clocks		500	ps
$t_{\text{JITTER}}$	Jitter on ClockLock/ClockBoost-generated clock (5)		200	ps
$t_{\text{INCLKSTB}}$	Input clock stability (measured between adjacent clocks)		50	ps

**Notes to Table 15:**

- (1) The PLL input frequency range for the EP20K100-1X device for 1x multiplication is 25 MHz to 175 MHz.
- (2) All input clock specifications must be met. The PLL may not lock onto an incoming clock if the clock specifications are not met, creating an erroneous clock within the device.
- (3) During device configuration, the ClockLock and ClockBoost circuitry is configured first. If the incoming clock is supplied during configuration, the ClockLock and ClockBoost circuitry locks during configuration, because the lock time is less than the configuration time.
- (4) The jitter specification is measured under long-term observation.
- (5) If the input clock stability is 100 ps,  $t_{\text{JITTER}}$  is 250 ps.

Table 16 summarizes the APEX 20K ClockLock and ClockBoost parameters for -2 speed grade devices.

**Table 16. APEX 20K ClockLock & ClockBoost Parameters for -2 Speed Grade Devices**

Symbol	Parameter	Min	Max	Unit
$f_{\text{OUT}}$	Output frequency	25	170	MHz
$f_{\text{CLK1}}$	Input clock frequency (ClockBoost clock multiplication factor equals 1)	25	170	MHz
$f_{\text{CLK2}}$	Input clock frequency (ClockBoost clock multiplication factor equals 2)	16	80	MHz
$f_{\text{CLK4}}$	Input clock frequency (ClockBoost clock multiplication factor equals 4)	10	34	MHz
$t_{\text{OUTDUTY}}$	Duty cycle for ClockLock/ClockBoost-generated clock	40	60	%
$f_{\text{CLKDEV}}$	Input deviation from user specification in the Quartus II software (ClockBoost clock multiplication factor equals one) (1)		25,000 (2)	PPM
$t_{\text{R}}$	Input rise time		5	ns
$t_{\text{F}}$	Input fall time		5	ns
$t_{\text{LOCK}}$	Time required for ClockLock/ ClockBoost to acquire lock (3)		10	$\mu$ s
$t_{\text{SKEW}}$	Skew delay between related ClockLock/ ClockBoost-generated clock	500	500	ps
$t_{\text{JITTER}}$	Jitter on ClockLock/ ClockBoost-generated clock (4)		200	ps
$t_{\text{INCLKSTB}}$	Input clock stability (measured between adjacent clocks)		50	ps

**Notes to Table 16:**

- (1) To implement the ClockLock and ClockBoost circuitry with the Quartus II software, designers must specify the input frequency. The Quartus II software tunes the PLL in the ClockLock and ClockBoost circuitry to this frequency. The  $f_{CLKDEV}$  parameter specifies how much the incoming clock can differ from the specified frequency during device operation. Simulation does not reflect this parameter.
- (2) Twenty-five thousand parts per million (PPM) equates to 2.5% of input clock period.
- (3) During device configuration, the ClockLock and ClockBoost circuitry is configured before the rest of the device. If the incoming clock is supplied during configuration, the ClockLock and ClockBoost circuitry locks during configuration because the  $t_{LOCK}$  value is less than the time required for configuration.
- (4) The  $t_{JITTER}$  specification is measured under long-term observation.

Tables 17 and 18 summarize the ClockLock and ClockBoost parameters for APEX 20KE devices.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_R$	Input rise time				5	ns
$t_F$	Input fall time				5	ns
$t_{INDUTY}$	Input duty cycle		40		60	%
$t_{INJITTER}$	Input jitter peak-to-peak				2% of input period	peak-to-peak
$t_{OUTJITTER}$	Jitter on ClockLock or ClockBoost-generated clock				0.35% of output period	RMS
$t_{OUTDUTY}$	Duty cycle for ClockLock or ClockBoost-generated clock		45		55	%
$t_{LOCK}$ (2), (3)	Time required for ClockLock or ClockBoost to acquire lock				40	$\mu$ s

Table 22 shows the JTAG timing parameters and values for APEX 20K devices.

Symbol	Parameter	Min	Max	Unit
t <sub>JCP</sub>	TCK clock period	100		ns
t <sub>JCH</sub>	TCK clock high time	50		ns
t <sub>JCL</sub>	TCK clock low time	50		ns
t <sub>JPSU</sub>	JTAG port setup time	20		ns
t <sub>JPH</sub>	JTAG port hold time	45		ns
t <sub>JPCO</sub>	JTAG port clock to output		25	ns
t <sub>JPZX</sub>	JTAG port high impedance to valid output		25	ns
t <sub>JPXZ</sub>	JTAG port valid output to high impedance		25	ns
t <sub>JSSU</sub>	Capture register setup time	20		ns
t <sub>JSH</sub>	Capture register hold time	45		ns
t <sub>JSCO</sub>	Update register clock to output		35	ns
t <sub>JSZX</sub>	Update register high impedance to valid output		35	ns
t <sub>JSXZ</sub>	Update register valid output to high impedance		35	ns

## Generic Testing

Each APEX 20K device is functionally tested. Complete testing of each configurable static random access memory (SRAM) bit and all logic functionality ensures 100% yield. AC test measurements for APEX 20K devices are made under conditions equivalent to those shown in Figure 32. Multiple test patterns can be used to configure devices during all stages of the production flow.

**Table 29. APEX 20KE Device DC Operating Conditions** *Notes (7), (8), (9)*

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
V <sub>IH</sub>	High-level LVTTTL, CMOS, or 3.3-V PCI input voltage		1.7, 0.5 × V <sub>CCIO</sub> (10)		4.1	V	
V <sub>IL</sub>	Low-level LVTTTL, CMOS, or 3.3-V PCI input voltage		-0.5		0.8, 0.3 × V <sub>CCIO</sub> (10)	V	
V <sub>OH</sub>	3.3-V high-level LVTTTL output voltage	I <sub>OH</sub> = -12 mA DC, V <sub>CCIO</sub> = 3.00 V (11)	2.4			V	
	3.3-V high-level LVCMOS output voltage	I <sub>OH</sub> = -0.1 mA DC, V <sub>CCIO</sub> = 3.00 V (11)	V <sub>CCIO</sub> - 0.2			V	
	3.3-V high-level PCI output voltage	I <sub>OH</sub> = -0.5 mA DC, V <sub>CCIO</sub> = 3.00 to 3.60 V (11)	0.9 × V <sub>CCIO</sub>			V	
	2.5-V high-level output voltage	I <sub>OH</sub> = -0.1 mA DC, V <sub>CCIO</sub> = 2.30 V (11)	2.1			V	
		I <sub>OH</sub> = -1 mA DC, V <sub>CCIO</sub> = 2.30 V (11)	2.0			V	
		I <sub>OH</sub> = -2 mA DC, V <sub>CCIO</sub> = 2.30 V (11)	1.7			V	
V <sub>OL</sub>	3.3-V low-level LVTTTL output voltage	I <sub>OL</sub> = 12 mA DC, V <sub>CCIO</sub> = 3.00 V (12)			0.4	V	
	3.3-V low-level LVCMOS output voltage	I <sub>OL</sub> = 0.1 mA DC, V <sub>CCIO</sub> = 3.00 V (12)			0.2	V	
	3.3-V low-level PCI output voltage	I <sub>OL</sub> = 1.5 mA DC, V <sub>CCIO</sub> = 3.00 to 3.60 V (12)			0.1 × V <sub>CCIO</sub>	V	
	2.5-V low-level output voltage	I <sub>OL</sub> = 0.1 mA DC, V <sub>CCIO</sub> = 2.30 V (12)				0.2	V
		I <sub>OL</sub> = 1 mA DC, V <sub>CCIO</sub> = 2.30 V (12)				0.4	V
		I <sub>OL</sub> = 2 mA DC, V <sub>CCIO</sub> = 2.30 V (12)				0.7	V
I <sub>I</sub>	Input pin leakage current	V <sub>I</sub> = 4.1 to -0.5 V (13)	-10		10	μA	
I <sub>OZ</sub>	Tri-stated I/O pin leakage current	V <sub>O</sub> = 4.1 to -0.5 V (13)	-10		10	μA

		V <sub>I</sub> = ground, no load, no toggling inputs, -2, -3 speed grades		5		mA	
R <sub>CONF</sub>	Value of I/O pin pull-up resistor before and during configuration	V <sub>CCIO</sub> = 3.0 V (14)	20		50	kΩ	
		V <sub>CCIO</sub> = 2.375 V (14)	30		80	kΩ	
		V <sub>CCIO</sub> = 1.71 V (14)	60		150	kΩ	

**Figure 33. Relationship between  $V_{CCIO}$  &  $V_{CCINT}$  for 3.3-V PCI Compliance**

Figure 34 shows the typical output drive characteristics of APEX 20K devices with 3.3-V and 2.5-V  $V_{CCIO}$ . The output driver is compatible with the 3.3-V *PCI Local Bus Specification, Revision 2.2* (when  $V_{CCIO}$  pins are connected to 3.3 V). 5-V tolerant APEX 20K devices in the -1 speed grade are 5-V PCI compliant over all operating conditions.

**Figure 34. Output Drive Characteristics of APEX 20K Device** *Note (1)*

*Note to Figure 34:*

(1) These are transient (AC) currents.

Figure 35 shows the output drive characteristics of APEX 20KE devices.

**Figure 35. Output Drive Characteristics of APEX 20KE Devices** *Note (1)*

**Note to Figure 35:**

(1) These are transient (AC) currents.

## Timing Model

The high-performance FastTrack and MegaLAB interconnect routing resources ensure predictable performance, accurate simulation, and accurate timing analysis. This predictable performance contrasts with that of FPGAs, which use a segmented connection scheme and therefore have unpredictable performance.

Figures 38 and 39 show the asynchronous and synchronous timing waveforms, respectively, for the ESB macroparameters in Table 31.

Figure 38. ESB Asynchronous Timing Waveforms

## Version 4.1

*APEX 20K Programmable Logic Device Family Data Sheet* version 4.1 contains the following changes:

- $t_{ESBWEH}$  added to [Figure 37](#) and [Tables 35, 50, 56, 62, 68, 74, 86, 92, 97, and 104](#).
- Updated EP20K300E device internal and external timing numbers in [Tables 79 through 84](#).
