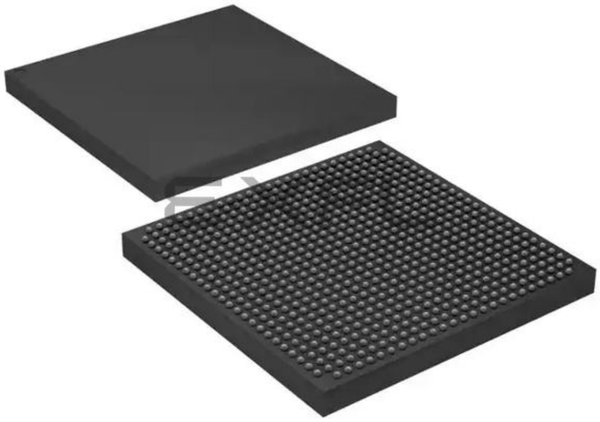
Intel - EP20K1000EFI672-2X Datasheet



Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	3840
Number of Logic Elements/Cells	38400
Total RAM Bits	327680
Number of I/O	508
Number of Gates	1772000
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	672-BBGA
Supplier Device Package	672-FBGA (27x27)
Purchase URL	https://www.e-xfl.com/product-detail/intel/ep20k1000efi672-2x

Table 2. Additional APEX 20K Device Features *Note (1)*

Feature	EP20K300E	EP20K400	EP20K400E	EP20K600E	EP20K1000E	EP20K1500E
Maximum system gates	728,000	1,052,000	1,052,000	1,537,000	1,772,000	2,392,000
Typical gates	300,000	400,000	400,000	600,000	1,000,000	1,500,000
LEs	11,520	16,640	16,640	24,320	38,400	51,840
ESBs	72	104	104	152	160	216
Maximum RAM bits	147,456	212,992	212,992	311,296	327,680	442,368
Maximum macrocells	1,152	1,664	1,664	2,432	2,560	3,456
Maximum user I/O pins	408	502	488	588	708	808

Note to Tables 1 and 2:

(1) The embedded IEEE Std. 1149.1 Joint Test Action Group (JTAG) boundary-scan circuitry contributes up to 57,000 additional gates.

Additional Features

- Designed for low-power operation
  - 1.8-V and 2.5-V supply voltage (see Table 3)
  - MultiVolt™ I/O interface support to interface with 1.8-V, 2.5-V, 3.3-V, and 5.0-V devices (see Table 3)
  - ESB offering programmable power-saving mode

Table 3. APEX 20K Supply Voltages

Feature	Device	
	EP20K100 EP20K200 EP20K400	EP20K30E EP20K60E EP20K100E EP20K160E EP20K200E EP20K300E EP20K400E EP20K600E EP20K1000E EP20K1500E
Internal supply voltage (V_{CCINT})	2.5 V	1.8 V
MultiVolt I/O interface voltage levels (V_{CCIO})	2.5 V, 3.3 V, 5.0 V	1.8 V, 2.5 V, 3.3 V, 5.0 V *(1)*

Note to Table 3:

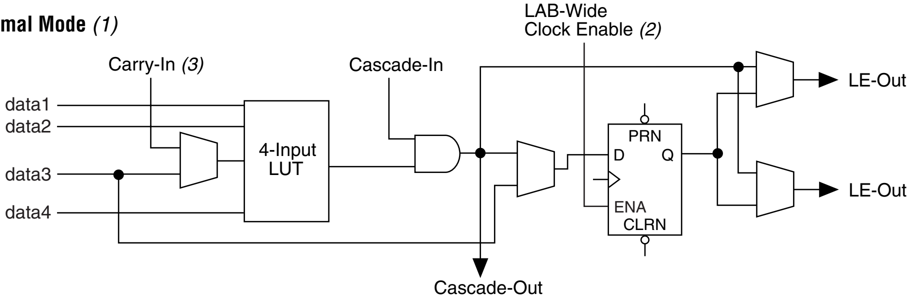
(1) APEX 20KE devices can be 5.0-V tolerant by using an external resistor.

Table 8. Comparison of APEX 20K & APEX 20KE Features

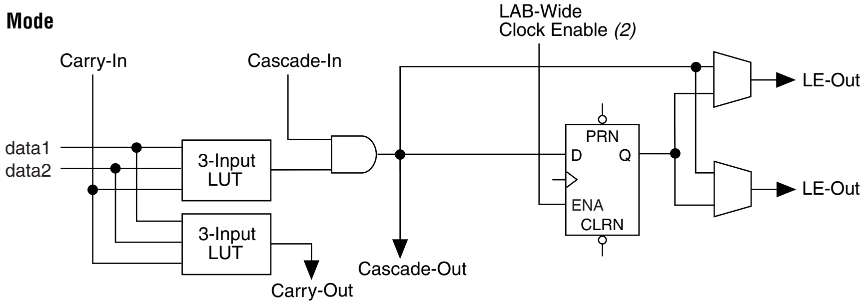
Feature	APEX 20K Devices	APEX 20KE Devices
MultiCore system integration	Full support	Full support
SignalTap logic analysis	Full support	Full support
32/64-Bit, 33-MHz PCI	Full compliance in -1, -2 speed grades	Full compliance in -1, -2 speed grades
32/64-Bit, 66-MHz PCI	-	Full compliance in -1 speed grade
MultiVolt I/O	2.5-V or 3.3-V V_{CCIO} V_{CCIO} selected for device Certain devices are 5.0-V tolerant	1.8-V, 2.5-V, or 3.3-V V_{CCIO} V_{CCIO} selected block-by-block 5.0-V tolerant with use of external resistor
ClockLock support	Clock delay reduction 2× and 4× clock multiplication	Clock delay reduction $m/(n \times v)$ or $m/(n \times k)$ clock multiplication Drive ClockLock output off-chip External clock feedback ClockShift LVDS support Up to four PLLs ClockShift, clock phase adjustment
Dedicated clock and input pins	Six	Eight
I/O standard support	2.5-V, 3.3-V, 5.0-V I/O 3.3-V PCI Low-voltage complementary metal-oxide semiconductor (LVCMOS) Low-voltage transistor-to-transistor logic (LVTTL)	1.8-V, 2.5-V, 3.3-V, 5.0-V I/O 2.5-V I/O 3.3-V PCI and PCI-X 3.3-V Advanced Graphics Port (AGP) Center tap terminated (CTT) GTL+ LVCMOS LVTTL True-LVDS and LVPECL data pins (in EP20K300E and larger devices) LVDS and LVPECL signaling (in all BGA and FineLine BGA devices) LVDS and LVPECL data pins up to 156 Mbps (in -1 speed grade devices) HSTL Class I PCI-X SSTL-2 Class I and II SSTL-3 Class I and II
Memory support	Dual-port RAM FIFO RAM ROM	CAM Dual-port RAM FIFO RAM ROM

Figure 8. APEX 20K LE Operating Modes

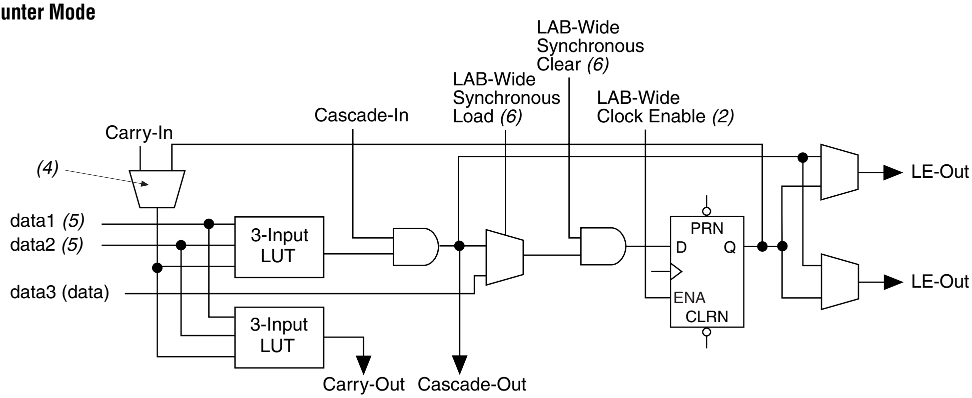
Normal Mode *(1)*



Arithmetic Mode



Counter Mode



Notes to Figure 8:

(1) LEs in normal mode support register packing.
(2) There are two LAB-wide clock enables per LAB.
(3) When using the carry-in in normal mode, the packed register feature is unavailable.
(4) A register feedback multiplexer is available on LE1 of each LAB.
(5) The `DATA1` and `DATA2` input signals can supply counter enable, up or down control, or register feedback signals for LEs other than the second LE in an LAB.
(6) The LAB-wide synchronous clear and LAB wide synchronous load affect all registers in an LAB.

Figure 10. FastTrack Connection to Local Interconnect

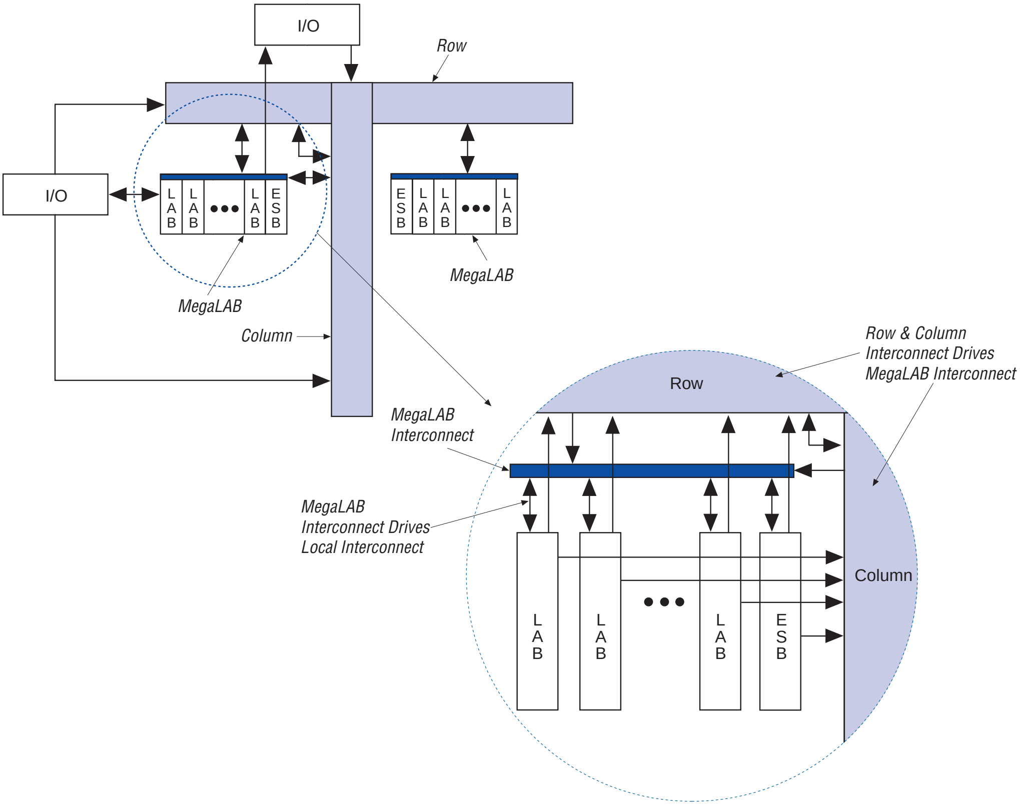


Figure 13. Product-Term Logic in ESB

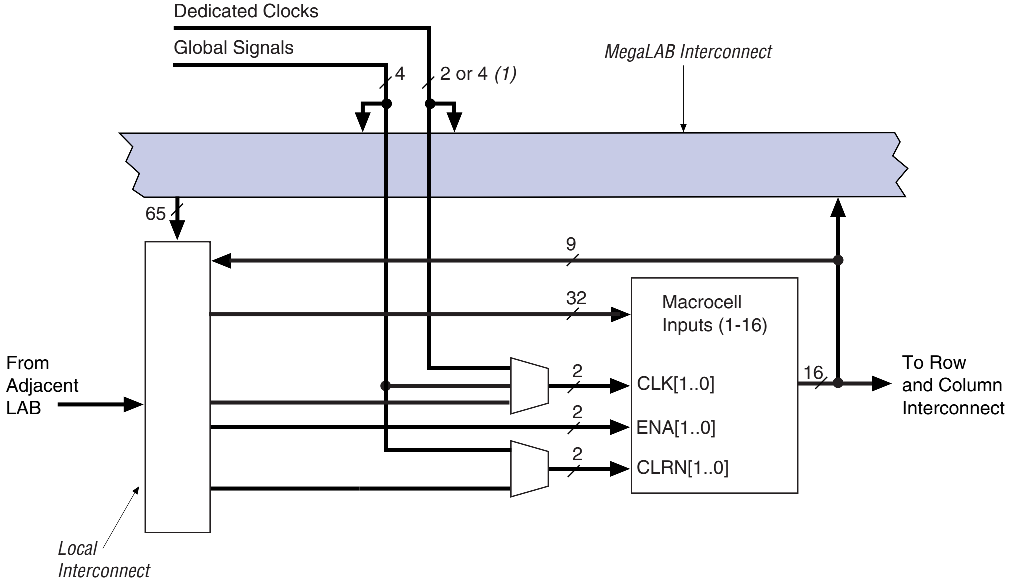


Note to Figure 13:

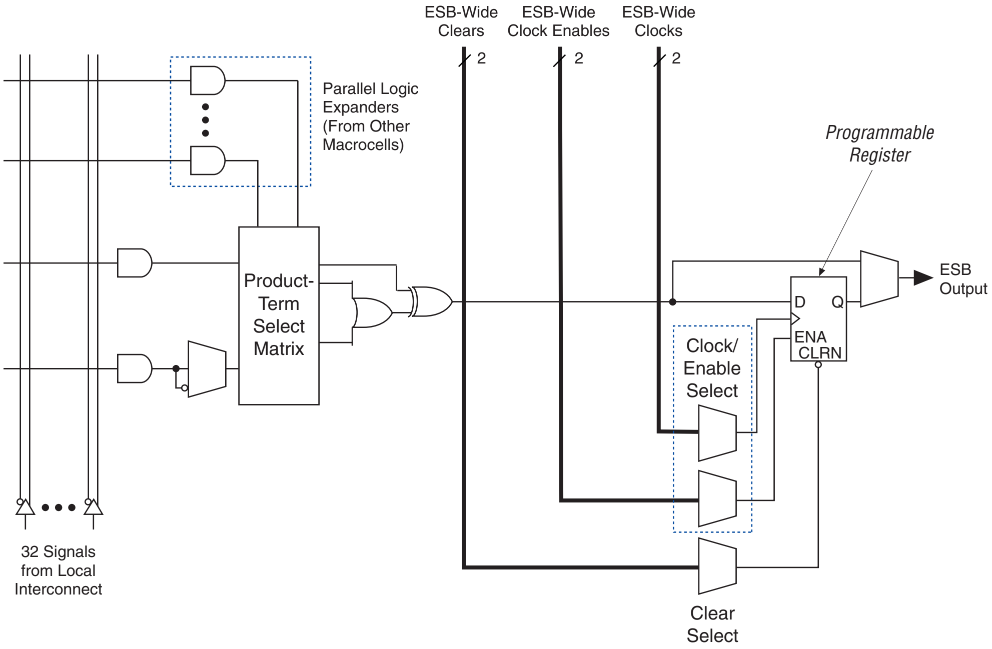
(1) APEX 20KE devices have four dedicated clocks.

Macrocells

APEX 20K macrocells can be configured individually for either sequential or combinatorial logic operation. The macrocell consists of three functional blocks: the logic array, the product-term select matrix, and the programmable register.

Combinatorial logic is implemented in the product terms. The product-term select matrix allocates these product terms for use as either primary logic inputs (to the `OR` and `XOR` gates) to implement combinatorial functions, or as parallel expanders to be used to increase the logic available to another macrocell. One product term can be inverted; the Quartus II software uses this feature to perform DeMorgan's inversion for more efficient implementation of wide `OR` functions. The Quartus II software Compiler can use a `NOT`-gate push-back technique to emulate an asynchronous preset. Figure 14 shows the APEX 20K macrocell.

Figure 14. APEX 20K Macrocell



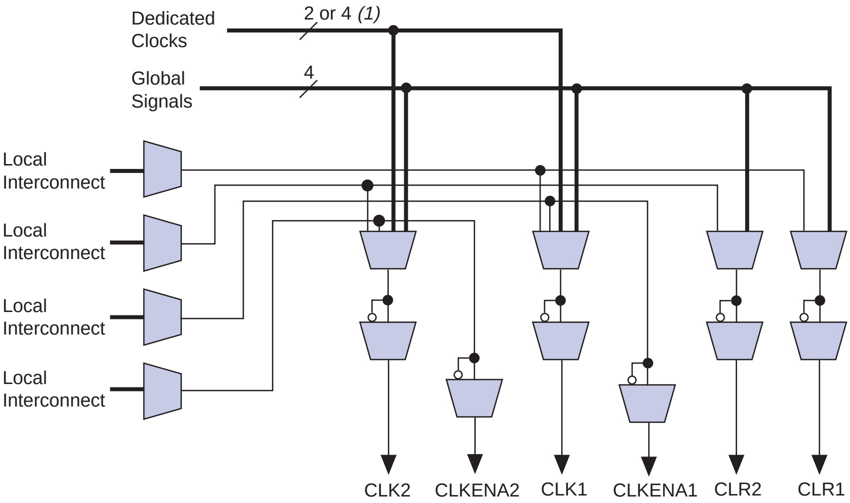
For registered functions, each macrocell register can be programmed individually to implement D, T, JK, or SR operation with programmable clock control. The register can be bypassed for combinatorial operation. During design entry, the designer specifies the desired register type; the Quartus II software then selects the most efficient register operation for each registered function to optimize resource utilization. The Quartus II software or other synthesis tools can also select the most efficient register operation automatically when synthesizing HDL designs.

Each programmable register can be clocked by one of two ESB-wide clocks. The ESB-wide clocks can be generated from device dedicated clock pins, global signals, or local interconnect. Each clock also has an associated clock enable, generated from the local interconnect. The clock and clock enable signals are related for a particular ESB; any macrocell using a clock also uses the associated clock enable.

If both the rising and falling edges of a clock are used in an ESB, both ESB-wide clock signals are used.

The programmable register also supports an asynchronous clear function. Within the ESB, two asynchronous clears are generated from global signals and the local interconnect. Each macrocell can either choose between the two asynchronous clear signals or choose to not be cleared. Either of the two clear signals can be inverted within the ESB. Figure 15 shows the ESB control logic when implementing product-terms.

Figure 15. ESB Product-Term Mode Control Logic



Note to Figure 15:

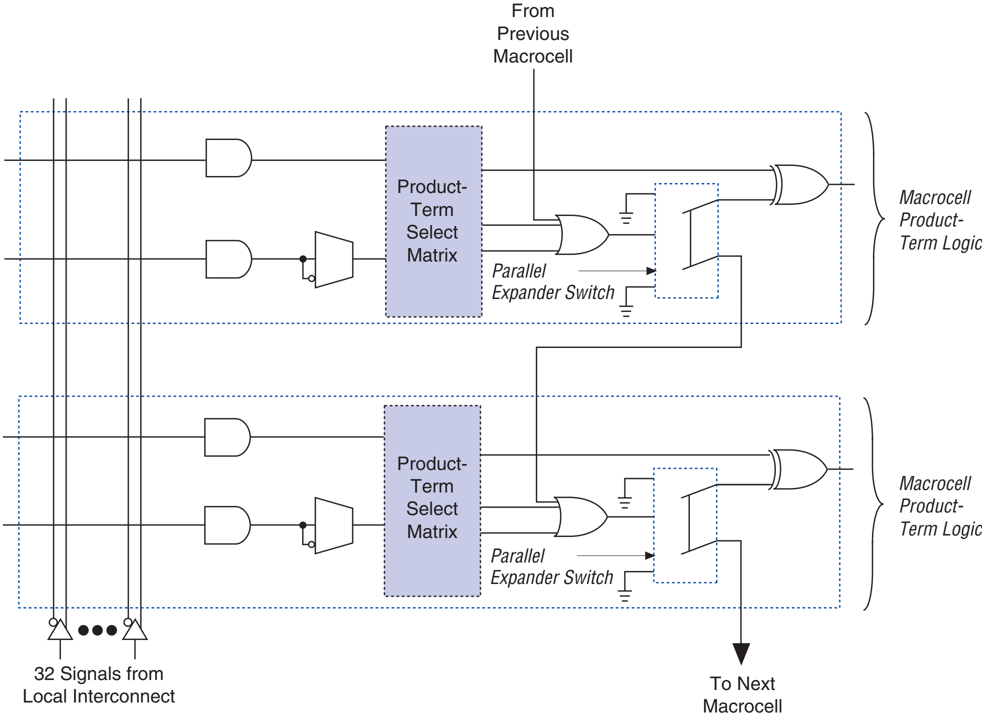
(1) APEX 20KE devices have four dedicated clocks.

Parallel Expanders

Parallel expanders are unused product terms that can be allocated to a neighboring macrocell to implement fast, complex logic functions. Parallel expanders allow up to 32 product terms to feed the macrocell `OR` logic directly, with two product terms provided by the macrocell and 30 parallel expanders provided by the neighboring macrocells in the ESB.

The Quartus II software Compiler can allocate up to 15 sets of up to two parallel expanders per set to the macrocells automatically. Each set of two parallel expanders incurs a small, incremental timing delay. Figure 16 shows the APEX 20K parallel expanders.

Figure 16. APEX 20K Parallel Expanders



Embedded System Block

The ESB can implement various types of memory blocks, including dual-port RAM, ROM, FIFO, and CAM blocks. The ESB includes input and output registers; the input registers synchronize writes, and the output registers can pipeline designs to improve system performance. The ESB offers a dual-port mode, which supports simultaneous reads and writes at two different clock frequencies. Figure 17 shows the ESB block diagram.

Figure 17. ESB Block Diagram

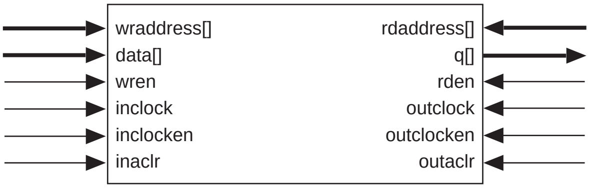


Figure 23. APEX 20KE CAM Block Diagram

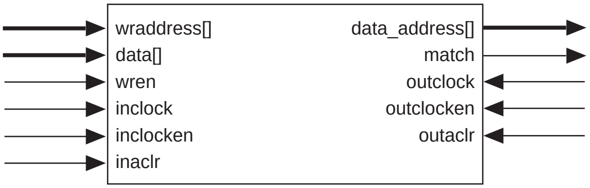


CAM can be used in any application requiring high-speed searches, such as networking, communications, data compression, and cache management.

The APEX 20KE on-chip CAM provides faster system performance than traditional discrete CAM. Integrating CAM and logic into the APEX 20KE device eliminates off-chip and on-chip delays, improving system performance.

When in CAM mode, the ESB implements 32-word, 32-bit CAM. Wider or deeper CAM can be implemented by combining multiple CAMs with some ancillary logic implemented in LEs. The Quartus II software combines ESBs and LEs automatically to create larger CAMs.

CAM supports writing "don't care" bits into words of the memory. The "don't-care" bit can be used as a mask for CAM comparisons; any bit set to "don't-care" has no effect on matches.

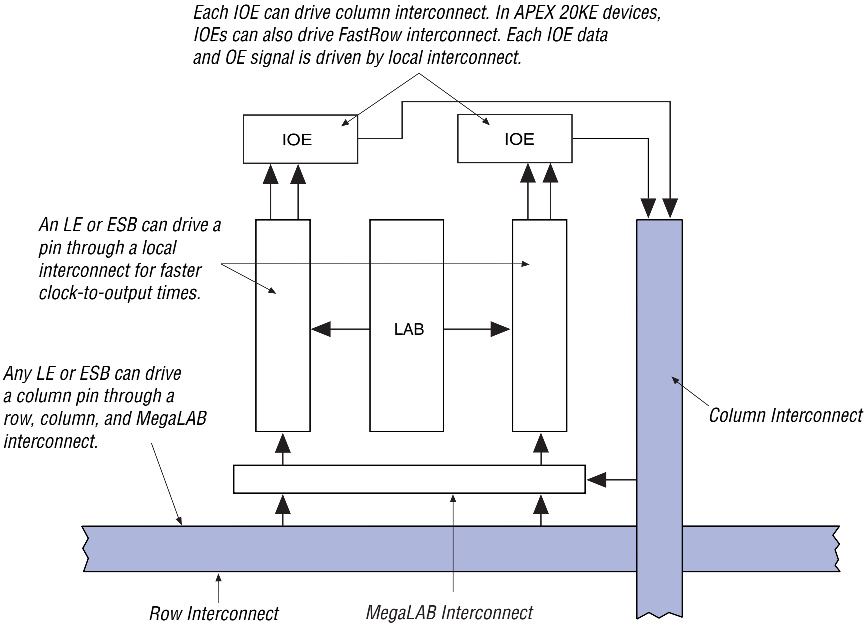
The output of the CAM can be encoded or unencoded. When encoded, the ESB outputs an encoded address of the data's location. For instance, if the data is located in address `12`, the ESB output is `12`. When unencoded, the ESB uses its 16 outputs to show the location of the data over two clock cycles. In this case, if the data is located in address `12`, the 12th output line goes high. When using unencoded outputs, two clock cycles are required to read the output because a 16-bit output bus is used to show the status of 32 words.

The encoded output is better suited for designs that ensure duplicate data is not written into the CAM. If duplicate data is written into two locations, the CAM's output will be incorrect. If the CAM may contain duplicate data, the unencoded output is a better solution; CAM with unencoded outputs can distinguish multiple data locations.

CAM can be pre-loaded with data during configuration, or it can be written during system operation. In most cases, two clock cycles are required to write each word into CAM. When "don't-care" bits are used, a third clock cycle is required.

Figure 28 shows how a column IOE connects to the interconnect.

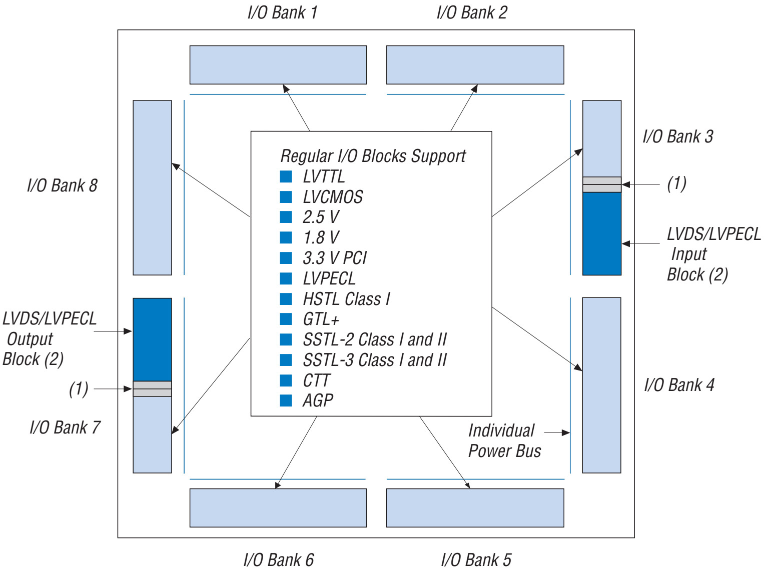
Figure 28. Column IOE Connection to the Interconnect



Dedicated Fast I/O Pins

APEX 20KE devices incorporate an enhancement to support bidirectional pins with high internal fanout such as PCI control signals. These pins are called Dedicated Fast I/O pins (`FAST1`, `FAST2`, `FAST3`, and `FAST4`) and replace dedicated inputs. These pins can be used for fast clock, clear, or high fanout logic signal distribution. They also can drive out. The Dedicated Fast I/O pin data output and tri-state control are driven by local interconnect from the adjacent MegaLAB for high speed.

Figure 29. APEX 20KE I/O Banks



Notes to Figure 29:

(1) For more information on placing I/O pins in LVDS blocks, refer to the *Guidelines for Using LVDS Blocks* section in *Application Note 120 (Using LVDS in APEX 20KE Devices)*.

(2) If the LVDS input and output blocks are not used for LVDS, they can support all of the I/O standards and can be used as input, output, or bidirectional pins with V_{CCIO} set to 3.3 V, 2.5 V, or 1.8 V.

Power Sequencing & Hot Socketing

Because APEX 20K and APEX 20KE devices can be used in a mixed-voltage environment, they have been designed specifically to tolerate any possible power-up sequence. Therefore, the V_{CCIO} and V_{CCINT} power supplies may be powered in any order.

For more information, please refer to the "Power Sequencing Considerations" section in the *Configuring APEX 20KE & APEX 20KC Devices* chapter of the *Configuration Devices Handbook*.

Signals can be driven into APEX 20K devices before and during power-up without damaging the device. In addition, APEX 20K devices do not drive out during power-up. Once operating conditions are reached and the device is configured, APEX 20K and APEX 20KE devices operate as specified by the user.

Table 18. APEX 20KE Clock Input & Output Parameters (Part 1 of 2) Note (1)

Symbol	Parameter	I/O Standard	-1X Speed Grade		-2X Speed Grade		Units
			Min	Max	Min	Max

IEEE Std. 1149.1 (JTAG) Boundary-Scan Support

All APEX 20K devices provide JTAG BST circuitry that complies with the IEEE Std. 1149.1-1990 specification. JTAG boundary-scan testing can be performed before or after configuration, but not during configuration. APEX 20K devices can also use the JTAG port for configuration with the Quartus II software or with hardware using either Jam Files (**.jam**) or Jam Byte-Code Files (**.jbc**). Finally, APEX 20K devices use the JTAG port to monitor the logic operation of the device with the SignalTap embedded logic analyzer. APEX 20K devices support the JTAG instructions shown in Table 19. Although EP20K1500E devices support the JTAG BYPASS and SignalTap instructions, they do not support boundary-scan testing or the use of the JTAG port for configuration.

Table 19. APEX 20K JTAG Instructions

JTAG Instruction	Description
SAMPLE/PRELOAD	Allows a snapshot of signals at the device pins to be captured and examined during normal device operation, and permits an initial data pattern to be output at the device pins. Also used by the SignalTap embedded logic analyzer.
EXTEST	Allows the external circuitry and board-level interconnections to be tested by forcing a test pattern at the output pins and capturing test results at the input pins.
BYPASS *(1)*	Places the 1-bit bypass register between the `TDI` and `TDO` pins, which allows the BST data to pass synchronously through selected devices to adjacent devices during normal device operation.
USERCODE	Selects the 32-bit USERCODE register and places it between the `TDI` and `TDO` pins, allowing the USERCODE to be serially shifted out of `TDO`.
IDCODE	Selects the IDCODE register and places it between `TDI` and `TDO`, allowing the IDCODE to be serially shifted out of `TDO`.
ICR Instructions	Used when configuring an APEX 20K device via the JTAG port with a MasterBlaster™ or ByteBlasterMV™ download cable, or when using a Jam File or Jam Byte-Code File via an embedded processor.
SignalTap Instructions *(1)*	Monitors internal device operation with the SignalTap embedded logic analyzer.

Note to Table 19:

(1) The EP20K1500E device supports the JTAG BYPASS instruction and the SignalTap instructions.

Figures 38 and 39 show the asynchronous and synchronous timing waveforms, respectively, for the ESB macroparameters in Table 31.

Power Consumption

To estimate device power consumption, use the interactive power calculator on the Altera web site at **http://www.altera.com**.

Configuration & Operation

The APEX 20K architecture supports several configuration schemes. This section summarizes the device operating modes and available device configuration schemes.

Operating Modes

The APEX architecture uses SRAM configuration elements that require configuration data to be loaded each time the circuit powers up. The process of physically loading the SRAM data into the device is called configuration. During initialization, which occurs immediately after configuration, the device resets registers, enables I/O pins, and begins to operate as a logic device. The I/O pins are tri-stated during power-up, and before and during configuration. Together, the configuration and initialization processes are called *command mode*; normal device operation is called *user mode*.

Before and during device configuration, all I/O pins are pulled to V_{CCIO} by a built-in weak pull-up resistor.

Revision History

The information contained in the *APEX 20K Programmable Logic Device Family Data Sheet* version 5.1 supersedes information published in previous versions.

Version 5.1

APEX 20K Programmable Logic Device Family Data Sheet version 5.1 contains the following changes:

- In version 5.0, the VI input voltage spec was updated in Table 28 on page 63.
- In version 5.0, *Note (5)* to Tables 27 through 30 was revised.
- Added *Note (2)* to Figure 21 on page 33.

Version 5.0

APEX 20K Programmable Logic Device Family Data Sheet version 5.0 contains the following changes:

- Updated Tables 23 through 26. Removed 2.5-V operating condition tables because all APEX 20K devices are now 5.0-V tolerant.
- Updated conditions in Tables 33, 38 and 39.
- Updated data for $t_{ESBDATAH}$ parameter.

Version 4.3

APEX 20K Programmable Logic Device Family Data Sheet version 4.3 contains the following changes:

- Updated Figure 20.
- Updated *Note (2)* to Table 13.
- Updated notes to Tables 27 through 30.

Version 4.2

APEX 20K Programmable Logic Device Family Data Sheet version 4.2 contains the following changes:

- Updated Figure 29.
- Updated *Note (1)* to Figure 29.
