### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

Product Status	Obsolete
Number of LABs/CLBs	416
Number of Logic Elements/Cells	4160
Total RAM Bits	53248
Number of I/O	246
Number of Gates	263000
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	324-BGA
Supplier Device Package	324-FBGA (19x19)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/intel/ep20k100efc324-2">https://www.e-xfl.com/product-detail/intel/ep20k100efc324-2</a>

**Table 2. Additional APEX 20K Device Features** *Note (1)*

Feature	EP20K300E	EP20K400	EP20K400E	EP20K600E	EP20K1000E	EP20K1500E
Maximum system gates	728,000	1,052,000	1,052,000	1,537,000	1,772,000	2,392,000
Typical gates	300,000	400,000	400,000	600,000	1,000,000	1,500,000
LEs	11,520	16,640	16,640	24,320	38,400	51,840
ESBs	72	104	104	152	160	216
Maximum RAM bits	147,456	212,992	212,992	311,296	327,680	442,368
Maximum macrocells	1,152	1,664	1,664	2,432	2,560	3,456
Maximum user I/O pins	408	502	488	588	708	808

*Note to Tables 1 and 2:*

- (1) The embedded IEEE Std. 1149.1 Joint Test Action Group (JTAG) boundary-scan circuitry contributes up to 57,000 additional gates.

## Additional Features

- Designed for low-power operation
  - 1.8-V and 2.5-V supply voltage (see Table 3)
  - MultiVolt™ I/O interface support to interface with 1.8-V, 2.5-V, 3.3-V, and 5.0-V devices (see Table 3)
  - ESB offering programmable power-saving mode

**Table 3. APEX 20K Supply Voltages**

Feature	Device	
	EP20K100 EP20K200 EP20K400	EP20K30E EP20K60E EP20K100E EP20K160E EP20K200E EP20K300E EP20K400E EP20K600E EP20K1000E EP20K1500E
Internal supply voltage ( $V_{CCINT}$ )	2.5 V	1.8 V
MultiVolt I/O interface voltage levels ( $V_{CCIO}$ )	2.5 V, 3.3 V, 5.0 V	1.8 V, 2.5 V, 3.3 V, 5.0 V (1)

*Note to Table 3:*

- (1) APEX 20KE devices can be 5.0-V tolerant by using an external resistor.

## General Description

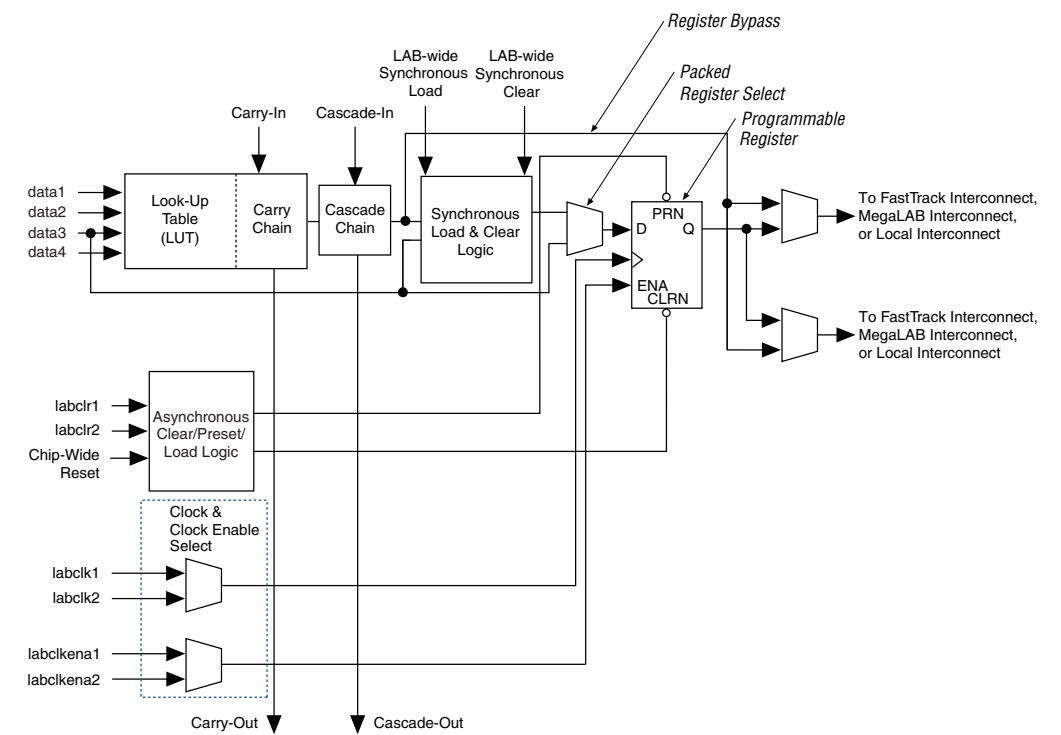

APEX™ 20K devices are the first PLDs designed with the MultiCore architecture, which combines the strengths of LUT-based and product-term-based devices with an enhanced memory structure. LUT-based logic provides optimized performance and efficiency for data-path, register-intensive, mathematical, or digital signal processing (DSP) designs. Product-term-based logic is optimized for complex combinatorial paths, such as complex state machines. LUT- and product-term-based logic combined with memory functions and a wide variety of MegaCore and AMPP functions make the APEX 20K device architecture uniquely suited for system-on-a-programmable-chip designs. Applications historically requiring a combination of LUT-, product-term-, and memory-based devices can now be integrated into one APEX 20K device.

APEX 20KE devices are a superset of APEX 20K devices and include additional features such as advanced I/O standard support, CAM, additional global clocks, and enhanced ClockLock clock circuitry. In addition, APEX 20KE devices extend the APEX 20K family to 1.5 million gates. APEX 20KE devices are denoted with an “E” suffix in the device name (e.g., the EP20K1000E device is an APEX 20KE device). [Table 8](#) compares the features included in APEX 20K and APEX 20KE devices.

Logic Element

interconnect, and FastTrack interconnect routing structures. See [Figure 9](#).

/ Register Bypass

EOI drives the outputs of the EE.

Each LE has two outputs that drive the local, MegaLAB, or FastTrack Interconnect routing structure. Each output can be driven independently by the LUT's or register's output. For example, the LUT can drive one output while the register drives the other output. This feature, called register packing, improves device utilization because the register and the LUT can be used for unrelated functions. The LE can also drive out registered and unregistered versions of the LUT output.

The APEX 20K architecture provides two types of dedicated high-speed data paths that connect adjacent LEs without using local interconnect paths: carry chains and cascade chains. A carry chain supports high-speed arithmetic functions such as counters and adders, while a cascade chain implements wide-input functions such as equality comparators with minimum delay. Carry and cascade chains connect LEs 1 through 10 in an LAB and all LABs in the same MegaLAB structure.

### *Carry Chain*

The carry chain provides a very fast carry-forward function between LEs. The carry-in signal from a lower-order bit drives forward into the higher-order bit via the carry chain, and feeds into both the LUT and the next portion of the carry chain. This feature allows the APEX 20K architecture to implement high-speed counters, adders, and comparators of arbitrary width. Carry chain logic can be created automatically by the Quartus II software Compiler during design processing, or manually by the designer during design entry. Parameterized functions such as library of parameterized modules (LPM) and DesignWare functions automatically take advantage of carry chains for the appropriate functions.

The Quartus II software Compiler creates carry chains longer than ten LEs by linking LABs together automatically. For enhanced fitting, a long carry chain skips alternate LABs in a MegaLAB™ structure. A carry chain longer than one LAB skips either from an even-numbered LAB to the next even-numbered LAB, or from an odd-numbered LAB to the next odd-numbered LAB. For example, the last LE of the first LAB in the upper-left MegaLAB structure carries to the first LE of the third LAB in the MegaLAB structure.

Figure 6 shows how an  $n$ -bit full adder can be implemented in  $n + 1$  LEs with the carry chain. One portion of the LUT generates the sum of two bits using the input signals and the carry-in signal; the sum is routed to the output of the LE. The register can be bypassed for simple adders or used for accumulator functions. Another portion of the LUT and the carry chain logic generates the carry-out signal, which is routed directly to the carry-in signal of the next-higher-order bit. The final carry-out signal is routed to an LE, where it is driven onto the local, MegaLAB, or FastTrack Interconnect routing structures.

### *LE Operating Modes*

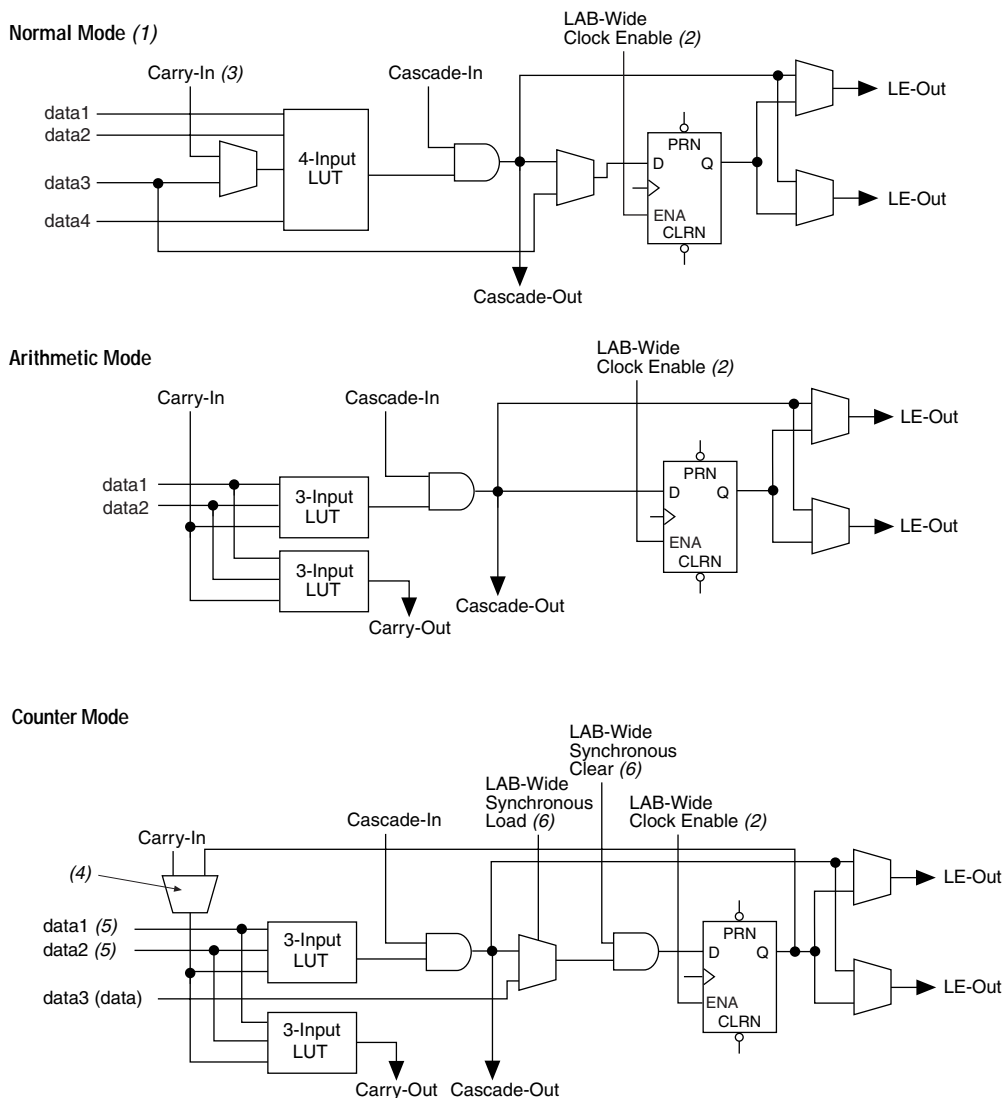

The APEX 20K LE can operate in one of the following three modes:

- Normal mode
- Arithmetic mode
- Counter mode

Each mode uses LE resources differently. In each mode, seven available inputs to the LE—the four data inputs from the LAB local interconnect, the feedback from the programmable register, and the carry-in and cascade-in from the previous LE—are directed to different destinations to implement the desired logic function. LAB-wide signals provide clock, asynchronous clear, asynchronous preset, asynchronous load, synchronous clear, synchronous load, and clock enable control for the register. These LAB-wide signals are available in all LE modes.

The Quartus II software, in conjunction with parameterized functions such as LPM and DesignWare functions, automatically chooses the appropriate mode for common functions such as counters, adders, and multipliers. If required, the designer can also create special-purpose functions that specify which LE operating mode to use for optimal performance. [Figure 8](#) shows the LE operating modes.

**Figure 8. APEX 20K LE Operating Modes**

**Notes to Figure 8:**

- (1) LEs in normal mode support register packing.
- (2) There are two LAB-wide clock enables per LAB.
- (3) When using the carry-in in normal mode, the packed register feature is unavailable.
- (4) A register feedback multiplexer is available on LE1 of each LAB.
- (5) The DATA1 and DATA2 input signals can supply counter enable, up or down control, or register feedback signals for LEs other than the second LE in an LAB.
- (6) The LAB-wide synchronous clear and LAB wide synchronous load affect all registers in an LAB.

Each IOE drives a row, column, MegaLAB, or local interconnect when used as an input or bidirectional pin. A row IOE can drive a local, MegaLAB, row, and column interconnect; a column IOE can drive the column interconnect. **Figure 27** shows how a row IOE connects to the interconnect.

**Figure 27. Row IOE Connection to the Interconnect**

Figure 28 shows how a column IOE connects to the interconnect.

**Figure 28. Column IOE Connection to the Interconnect**

## Dedicated Fast I/O Pins

APEX 20KE devices incorporate an enhancement to support bidirectional pins with high internal fanout such as PCI control signals. These pins are called Dedicated Fast I/O pins (FAST1, FAST2, FAST3, and FAST4) and replace dedicated inputs. These pins can be used for fast clock, clear, or high fanout logic signal distribution. They also can drive out. The Dedicated Fast I/O pin data output and tri-state control are driven by local interconnect from the adjacent MegaLAB for high speed.

APEX 20KE devices also support the MultiVolt I/O interface feature. The APEX 20KE VCCINT pins must always be connected to a 1.8-V power supply. With a 1.8-V VCCINT level, input pins are 1.8-V, 2.5-V, and 3.3-V tolerant. The VCCIO pins can be connected to either a 1.8-V, 2.5-V, or 3.3-V power supply, depending on the I/O standard requirements. When the VCCIO pins are connected to a 1.8-V power supply, the output levels are compatible with 1.8-V systems. When VCCIO pins are connected to a 2.5-V power supply, the output levels are compatible with 2.5-V systems. When VCCIO pins are connected to a 3.3-V power supply, the output high is 3.3 V and compatible with 3.3-V or 5.0-V systems. An APEX 20KE device is 5.0-V tolerant with the addition of a resistor.

Table 13 summarizes APEX 20KE MultiVolt I/O support.

<b>Table 13. APEX 20KE MultiVolt I/O Support</b> <i>Note (1)</i>								
V <sub>CCIO</sub> (V)	Input Signals (V)				Output Signals (V)			
	1.8	2.5	3.3	5.0	1.8	2.5	3.3	5.0
1.8	✓	✓	✓		✓			
2.5	✓	✓	✓			✓		
3.3	✓	✓	✓	(2)			✓(3)	

**Notes to Table 13:**

- (1) The PCI clamping diode must be disabled to drive an input with voltages higher than V<sub>CCIO</sub>, except for the 5.0-V input case.
- (2) An APEX 20KE device can be made 5.0-V tolerant with the addition of an external resistor. You also need a PCI clamp and series resistor.
- (3) When V<sub>CCIO</sub> = 3.3 V, an APEX 20KE device can drive a 2.5-V device with 3.3-V tolerant inputs.

## ClockLock & ClockBoost Features

APEX 20K devices support the ClockLock and ClockBoost clock management features, which are implemented with PLLs. The ClockLock circuitry uses a synchronizing PLL that reduces the clock delay and skew within a device. This reduction minimizes clock-to-output and setup times while maintaining zero hold times. The ClockBoost circuitry, which provides a clock multiplier, allows the designer to enhance device area efficiency by sharing resources within the device. The ClockBoost circuitry allows the designer to distribute a low-speed clock and multiply that clock on-device. APEX 20K devices include a high-speed clock tree; unlike ASICs, the user does not have to design and optimize the clock tree. The ClockLock and ClockBoost features work in conjunction with the APEX 20K device's high-speed clock to provide significant improvements in system performance and band-width. Devices with an X-suffix on the ordering code include the ClockLock circuit.

The ClockLock and ClockBoost features in APEX 20K devices are enabled through the Quartus II software. External devices are not required to use these features.

### *Clock Phase & Delay Adjustment*

The APEX 20KE ClockShift feature allows the clock phase and delay to be adjusted. The clock phase can be adjusted by 90° steps. The clock delay can be adjusted to increase or decrease the clock delay by an arbitrary amount, up to one clock period.

### *LVDS Support*

Two PLLs are designed to support the LVDS interface. When using LVDS, the I/O clock runs at a slower rate than the data transfer rate. Thus, PLLs are used to multiply the I/O clock internally to capture the LVDS data. For example, an I/O clock may run at 105 MHz to support 840 megabits per second (Mbps) LVDS data transfer. In this example, the PLL multiplies the incoming clock by eight to support the high-speed data transfer. You can use PLLs in EP20K400E and larger devices for high-speed LVDS interfacing.

### *Lock Signals*

The APEX 20KE ClockLock circuitry supports individual LOCK signals. The LOCK signal drives high when the ClockLock circuit has locked onto the input clock. The LOCK signals are optional for each ClockLock circuit; when not used, they are I/O pins.

## **ClockLock & ClockBoost Timing Parameters**

For the ClockLock and ClockBoost circuitry to function properly, the incoming clock must meet certain requirements. If these specifications are not met, the circuitry may not lock onto the incoming clock, which generates an erroneous clock within the device. The clock generated by the ClockLock and ClockBoost circuitry must also meet certain specifications. If the incoming clock meets these requirements during configuration, the APEX 20K ClockLock and ClockBoost circuitry will lock onto the clock during configuration. The circuit will be ready for use immediately after configuration. In APEX 20KE devices, the clock input standard is programmable, so the PLL cannot respond to the clock until the device is configured. The PLL locks onto the input clock as soon as configuration is complete. [Figure 30](#) shows the incoming and generated clock specifications.

For more information on ClockLock and ClockBoost circuitry, see *Application Note 115: Using the ClockLock and ClockBoost PLL Features in APEX Devices*.

**Table 18. APEX 20KE Clock Input & Output Parameters (Part 1 of 2)** *Note (1)*

Symbol	Parameter	I/O Standard	-1X Speed Grade		-2X Speed Grade		Units
			Min	Max	Min	Max	
$f_{VCO}$ (4)	Voltage controlled oscillator operating range		200	500	200	500	MHz
$f_{CLOCK0}$	Clock0 PLL output frequency for internal use		1.5	335	1.5	200	MHz
$f_{CLOCK1}$	Clock1 PLL output frequency for internal use		20	335	20	200	MHz
$f_{CLOCK0\_EXT}$	Output clock frequency for external clock0 output	3.3-V LVTTTL	1.5	245	1.5	226	MHz
		2.5-V LVTTTL	1.5	234	1.5	221	MHz
		1.8-V LVTTTL	1.5	223	1.5	216	MHz
		GTL+	1.5	205	1.5	193	MHz
		SSTL-2 Class I	1.5	158	1.5	157	MHz
		SSTL-2 Class II	1.5	142	1.5	142	MHz
		SSTL-3 Class I	1.5	166	1.5	162	MHz
		SSTL-3 Class II	1.5	149	1.5	146	MHz
		LVDS	1.5	420	1.5	350	MHz
$f_{CLOCK1\_EXT}$	Output clock frequency for external clock1 output	3.3-V LVTTTL	20	245	20	226	MHz
		2.5-V LVTTTL	20	234	20	221	MHz
		1.8-V LVTTTL	20	223	20	216	MHz
		GTL+	20	205	20	193	MHz
		SSTL-2 Class I	20	158	20	157	MHz
		SSTL-2 Class II	20	142	20	142	MHz
		SSTL-3 Class I	20	166	20	162	MHz
		SSTL-3 Class II	20	149	20	146	MHz
		LVDS	20	420	20	350	MHz

**Table 18. APEX 20KE Clock Input & Output Parameters (Part 2 of 2) Note (1)**

Symbol	Parameter	I/O Standard	-1X Speed Grade		-2X Speed Grade		Units
			Min	Max	Min	Max	
$f_{IN}$	Input clock frequency	3.3-V LVTTL	1.5	290	1.5	257	MHz
		2.5-V LVTTL	1.5	281	1.5	250	MHz
		1.8-V LVTTL	1.5	272	1.5	243	MHz
		GTL+	1.5	303	1.5	261	MHz
		SSTL-2 Class I	1.5	291	1.5	253	MHz
		SSTL-2 Class II	1.5	291	1.5	253	MHz
		SSTL-3 Class I	1.5	300	1.5	260	MHz
		SSTL-3 Class II	1.5	300	1.5	260	MHz
		LVDS	1.5	420	1.5	350	MHz

**Notes to Tables 17 and 18:**

- (1) All input clock specifications must be met. The PLL may not lock onto an incoming clock if the clock specifications are not met, creating an erroneous clock within the device.
- (2) The maximum lock time is 40  $\mu$ s or 2000 input clock cycles, whichever occurs first.
- (3) Before configuration, the PLL circuits are disable and powered down. During configuration, the PLLs are still disabled. The PLLs begin to lock once the device is in the user mode. If the clock enable feature is used, lock begins once the CLKLK\_ENA pin goes high in user mode.
- (4) The PLL VCO operating range is 200 MHz  $\delta$   $f_{VCO}$   $\delta$  840 MHz for LVDS mode.

## SignalTap Embedded Logic Analyzer

APEX 20K devices include device enhancements to support the SignalTap embedded logic analyzer. By including this circuitry, the APEX 20K device provides the ability to monitor design operation over a period of time through the IEEE Std. 1149.1 (JTAG) circuitry; a designer can analyze internal logic at speed without bringing internal signals to the I/O pins. This feature is particularly important for advanced packages such as FineLine BGA packages because adding a connection to a pin during the debugging process can be difficult after a board is designed and manufactured.

**Table 26. APEX 20K 5.0-V Tolerant Device Capacitance** *Notes (2), (14)*

Symbol	Parameter	Conditions	Min	Max	Unit
$C_{IN}$	Input capacitance	$V_{IN} = 0\text{ V}$ , $f = 1.0\text{ MHz}$		8	pF
$C_{INCLK}$	Input capacitance on dedicated clock pin	$V_{IN} = 0\text{ V}$ , $f = 1.0\text{ MHz}$		12	pF
$C_{OUT}$	Output capacitance	$V_{OUT} = 0\text{ V}$ , $f = 1.0\text{ MHz}$		8	pF

**Notes to Tables 23 through 26:**

- (1) See the *Operating Requirements for Altera Devices Data Sheet*.
- (2) All APEX 20K devices are 5.0-V tolerant.
- (3) Minimum DC input is  $-0.5\text{ V}$ . During transitions, the inputs may undershoot to  $-2.0\text{ V}$  or overshoot to  $5.75\text{ V}$  for input currents less than  $100\text{ mA}$  and periods shorter than  $20\text{ ns}$ .
- (4) Numbers in parentheses are for industrial-temperature-range devices.
- (5) Maximum  $V_{CC}$  rise time is  $100\text{ ms}$ , and  $V_{CC}$  must rise monotonically.
- (6) All pins, including dedicated inputs, clock I/O, and JTAG pins, may be driven before  $V_{CCINT}$  and  $V_{CCIO}$  are powered.
- (7) Typical values are for  $T_A = 25^\circ\text{C}$ ,  $V_{CCINT} = 2.5\text{ V}$ , and  $V_{CCIO} = 2.5\text{ or }3.3\text{ V}$ .
- (8) These values are specified in the APEX 20K device recommended operating conditions, shown in Table 26 on page 62.
- (9) The APEX 20K input buffers are compatible with  $2.5\text{-V}$  and  $3.3\text{-V}$  (LVTTTL and LVC MOS) signals. Additionally, the input buffers are  $3.3\text{-V}$  PCI compliant when  $V_{CCIO}$  and  $V_{CCINT}$  meet the relationship shown in Figure 33 on page 68.
- (10) The  $I_{OH}$  parameter refers to high-level TTL, PCI or CMOS output current.
- (11) The  $I_{OL}$  parameter refers to low-level TTL, PCI, or CMOS output current. This parameter applies to open-drain pins as well as output pins.
- (12) This value is specified for normal device operation. The value may vary during power-up.
- (13) Pin pull-up resistance values will be lower if an external source drives the pin higher than  $V_{CCIO}$ .
- (14) Capacitance is sample-tested only.

Tables 27 through 30 provide information on absolute maximum ratings, recommended operating conditions, DC operating conditions, and capacitance for 1.8-V APEX 20KE devices.

**Table 27. APEX 20KE Device Absolute Maximum Ratings** *Note (1)*

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{CCINT}$	Supply voltage	With respect to ground (2)	$-0.5$	2.5	V
$V_{CCIO}$			$-0.5$	4.6	V
$V_I$			$-0.5$	4.6	V
$I_{OUT}$	DC output current, per pin		$-25$	25	mA
$T_{STG}$	Storage temperature	No bias	$-65$	150	$^\circ\text{C}$
$T_{AMB}$	Ambient temperature	Under bias	$-65$	135	$^\circ\text{C}$
$T_J$	Junction temperature	PQFP, RQFP, TQFP, and BGA packages, under bias		135	$^\circ\text{C}$
		Ceramic PGA packages, under bias		150	$^\circ\text{C}$

Figure 33. Relationship between  $V_{CCIO}$  &  $V_{CCINT}$  for 3.3-V PCI Compliance

Figure 34 shows the typical output drive characteristics of APEX 20K devices with 3.3-V and 2.5-V  $V_{CCIO}$ . The output driver is compatible with the 3.3-V *PCI Local Bus Specification, Revision 2.2* (when  $V_{CCIO}$  pins are connected to 3.3 V). 5-V tolerant APEX 20K devices in the -1 speed grade are 5-V PCI compliant over all operating conditions.

Figure 34. Output Drive Characteristics of APEX 20K Device *Note (1)*

Note to Figure 34:

(1) These are transient (AC) currents.

**Table 31. APEX 20K  $t_{MAX}$  Timing Parameters (Part 2 of 2)**

Symbol	Parameter
$t_{ESB\text{DATA}CO2}$	ESB clock-to-output delay without output registers
$t_{ESBDD}$	ESB data-in to data-out delay for RAM mode
$t_{PD}$	ESB macrocell input to non-registered output
$t_{PTERMSU}$	ESB macrocell register setup time before clock
$t_{PTERMCO}$	ESB macrocell register clock-to-output delay
$t_{F1-4}$	Fanout delay using local interconnect
$t_{F5-20}$	Fanout delay using MegaLab Interconnect
$t_{F20+}$	Fanout delay using FastTrack Interconnect
$t_{CH}$	Minimum clock high time from clock pin
$t_{CL}$	Minimum clock low time from clock pin
$t_{CLRP}$	LE clear pulse width
$t_{PREP}$	LE preset pulse width
$t_{ESBCH}$	Clock high time
$t_{ESBCL}$	Clock low time
$t_{ESBWP}$	Write pulse width
$t_{ESBRP}$	Read pulse width

Tables 32 and 33 describe APEX 20K external timing parameters.

**Table 32. APEX 20K External Timing Parameters Note (1)**

Symbol	Clock Parameter
$t_{INSU}$	Setup time with global clock at IOE register
$t_{INH}$	Hold time with global clock at IOE register
$t_{OUTCO}$	Clock-to-output delay with global clock at IOE register

**Table 33. APEX 20K External Bidirectional Timing Parameters Note (1)**

Symbol	Parameter	Conditions
$t_{INSUBIDIR}$	Setup time for bidirectional pins with global clock at same-row or same-column LE register	
$t_{INHBIDIR}$	Hold time for bidirectional pins with global clock at same-row or same-column LE register	
$t_{OUTCOBIDIR}$	Clock-to-output delay for bidirectional pins with global clock at IOE register	C1 = 10 pF
$t_{XZBIDIR}$	Synchronous IOE output buffer disable delay	C1 = 10 pF
$t_{ZXBIDIR}$	Synchronous IOE output buffer enable delay, slow slew rate = off	C1 = 10 pF
