Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	416
Number of Logic Elements/Cells	4160
Total RAM Bits	53248
Number of I/O	92
Number of Gates	263000
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	https://www.e-xfl.com/product-detail/intel/ep20k100eti144-3

Table 5. APEX 20K FineLine BGA Package Options & I/O Count *Notes (1), (2)*

Device	144 Pin	324 Pin	484 Pin	672 Pin	1,020 Pin

EP20K1000E				508 (3)	708
EP20K1500E					808

Notes to Tables 4 and 5:

- (1) I/O counts include dedicated input and clock pins.
- (2) APEX 20K device package types include thin quad flat pack (TQFP), plastic quad flat pack (PQFP), power quad flat pack (RQFP), 1.27-mm pitch ball-grid array (BGA), 1.00-mm pitch FineLine BGA, and pin-grid array (PGA) packages.
- (3) This device uses a thermally enhanced package, which is taller than the regular package. Consult the *Altera Device Package Information Data Sheet* for detailed package size information.

Table 6. APEX 20K QFP, BGA & PGA Package Sizes

Feature	144-Pin TQFP	208-Pin QFP	240-Pin QFP	356-Pin BGA	652-Pin BGA	655-Pin PGA
Pitch (mm)	0.50	0.50	0.50	1.27	1.27	–
Area (mm ²)	484	924	1,218	1,225	2,025	3,906

Area (mm ²)	169	361	529	729	1,089
Length × Width (mm × mm)	13 × 13	19 × 19	23 × 23	27 × 27	33 × 33

Table 8. Comparison of APEX 20K & APEX 20KE Features

Feature	APEX 20K Devices	APEX 20KE Devices
MultiCore system integration	Full support	Full support
SignalTap logic analysis	Full support	Full support
32/64-Bit, 33-MHz PCI	Full compliance in -1, -2 speed grades	Full compliance in -1, -2 speed grades
32/64-Bit, 66-MHz PCI	-	Full compliance in -1 speed grade
MultiVolt I/O	2.5-V or 3.3-V V_{CCIO} V_{CCIO} selected for device Certain devices are 5.0-V tolerant	1.8-V, 2.5-V, or 3.3-V V_{CCIO} V_{CCIO} selected block-by-block 5.0-V tolerant with use of external resistor
ClockLock support	Clock delay reduction 2× and 4× clock multiplication	Clock delay reduction $m/(n \times v)$ or $m/(n \times k)$ clock multiplication Drive ClockLock output off-chip External clock feedback ClockShift LVDS support Up to four PLLs ClockShift, clock phase adjustment
Dedicated clock and input pins	Six	Eight
I/O standard support	2.5-V, 3.3-V, 5.0-V I/O 3.3-V PCI Low-voltage complementary metal-oxide semiconductor (LVCMOS) Low-voltage transistor-to-transistor logic (LVTTL)	1.8-V, 2.5-V, 3.3-V, 5.0-V I/O 2.5-V I/O 3.3-V PCI and PCI-X 3.3-V Advanced Graphics Port (AGP) Center tap terminated (CTT) GTL+ LVCMOS LVTTL True-LVDS and LVPECL data pins (in EP20K300E and larger devices) LVDS and LVPECL signaling (in all BGA and FineLine BGA devices) LVDS and LVPECL data pins up to 156 Mbps (in -1 speed grade devices) HSTL Class I PCI-X SSTL-2 Class I and II SSTL-3 Class I and II
Memory support	Dual-port RAM FIFO RAM ROM	CAM Dual-port RAM FIFO RAM ROM

Logic Element

The LE, the smallest unit of logic in the APEX 20K architecture, is compact and provides efficient logic usage. Each LE contains a four-input LUT, which is a function generator that can quickly implement any function of four variables. In addition, each LE contains a programmable register and carry and cascade chains. Each LE drives the local interconnect, MegaLAB interconnect, and FastTrack Interconnect routing structures. See [Figure 5](#).

Each LE's programmable register can be configured for D, T, JK, or SR operation. The register's clock and clear control signals can be driven by global signals, general-purpose I/O pins, or any internal logic. For combinatorial functions, the register is bypassed and the output of the LUT drives the outputs of the LE.

Each LE has two outputs that drive the local, MegaLAB, or FastTrack Interconnect routing structure. Each output can be driven independently by the LUT's or register's output. For example, the LUT can drive one output while the register drives the other output. This feature, called register packing, improves device utilization because the register and the LUT can be used for unrelated functions. The LE can also drive out registered and unregistered versions of the LUT output.

The APEX 20K architecture provides two types of dedicated high-speed data paths that connect adjacent LEs without using local interconnect paths: carry chains and cascade chains. A carry chain supports high-speed arithmetic functions such as counters and adders, while a cascade chain implements wide-input functions such as equality comparators with minimum delay. Carry and cascade chains connect LEs 1 through 10 in an LAB and all LABs in the same MegaLAB structure.

Carry Chain

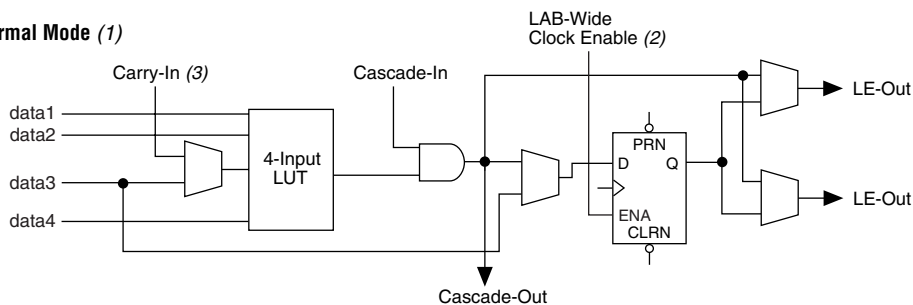

The carry chain provides a very fast carry-forward function between LEs. The carry-in signal from a lower-order bit drives forward into the higher-order bit via the carry chain, and feeds into both the LUT and the next portion of the carry chain. This feature allows the APEX 20K architecture to implement high-speed counters, adders, and comparators of arbitrary width. Carry chain logic can be created automatically by the Quartus II software Compiler during design processing, or manually by the designer during design entry. Parameterized functions such as library of parameterized modules (LPM) and DesignWare functions automatically take advantage of carry chains for the appropriate functions.

The Quartus II software Compiler creates carry chains longer than ten LEs by linking LABs together automatically. For enhanced fitting, a long carry chain skips alternate LABs in a MegaLAB™ structure. A carry chain longer than one LAB skips either from an even-numbered LAB to the next even-numbered LAB, or from an odd-numbered LAB to the next odd-numbered LAB. For example, the last LE of the first LAB in the upper-left MegaLAB structure carries to the first LE of the third LAB in the MegaLAB structure.

Figure 6 shows how an n -bit full adder can be implemented in $n + 1$ LEs with the carry chain. One portion of the LUT generates the sum of two bits using the input signals and the carry-in signal; the sum is routed to the output of the LE. The register can be bypassed for simple adders or used for accumulator functions. Another portion of the LUT and the carry chain logic generates the carry-out signal, which is routed directly to the carry-in signal of the next-higher-order bit. The final carry-out signal is routed to an LE, where it is driven onto the local, MegaLAB, or FastTrack Interconnect routing structures.

Figure 8. APEX 20K LE Operating Modes

Normal Mode (1)

Arithmetic Mode

Counter Mode

Notes to Figure 8:

- (1) LEs in normal mode support register packing.
- (2) There are two LAB-wide clock enables per LAB.
- (3) When using the carry-in in normal mode, the packed register feature is unavailable.
- (4) A register feedback multiplexer is available on LE1 of each LAB.
- (5) The DATA1 and DATA2 input signals can supply counter enable, up or down control, or register feedback signals for LEs other than the second LE in an LAB.
- (6) The LAB-wide synchronous clear and LAB wide synchronous load affect all registers in an LAB.

Figure 11 shows the intersection of a row and column interconnect, and how these forms of interconnects and LEs drive each other.

Figure 11. Driving the FastTrack Interconnect

APEX 20KE devices include an enhanced interconnect structure for faster routing of input signals with high fan-out. Column I/O pins can drive the FastRow™ interconnect, which routes signals directly into the local interconnect without having to drive through the MegaLAB interconnect. FastRow lines traverse two MegaLAB structures. Also, these pins can drive the local interconnect directly for fast setup times. On EP20K300E and larger devices, the FastRow interconnect drives the two MegaLABs in the top left corner, the two MegaLABs in the top right corner, the two MegaLABs in the bottom left corner, and the two MegaLABs in the bottom right corner. On EP20K200E and smaller devices, FastRow interconnect drives the two MegaLABs on the top and the two MegaLABs on the bottom of the device. On all devices, the FastRow interconnect drives all local interconnect in the appropriate MegaLABs except the local interconnect on the side of the MegaLAB opposite the ESB. Pins using the FastRow interconnect achieve a faster set-up time, as the signal does not need to use a MegaLAB interconnect line to reach the destination LE. Figure 12 shows the FastRow interconnect.

Figure 16. APEX 20K Parallel Expanders

Embedded System Block

The ESB can implement various types of memory blocks, including dual-port RAM, ROM, FIFO, and CAM blocks. The ESB includes input and output registers; the input registers synchronize writes, and the output registers can pipeline designs to improve system performance. The ESB offers a dual-port mode, which supports simultaneous reads and writes at two different clock frequencies. Figure 17 shows the ESB block diagram.

Figure 17. ESB Block Diagram

Figure 23. APEX 20KE CAM Block Diagram

CAM can be used in any application requiring high-speed searches, such as networking, communications, data compression, and cache management.

The APEX 20KE on-chip CAM provides faster system performance than traditional discrete CAM. Integrating CAM and logic into the APEX 20KE device eliminates off-chip and on-chip delays, improving system performance.

When in CAM mode, the ESB implements 32-word, 32-bit CAM. Wider or deeper CAM can be implemented by combining multiple CAMs with some ancillary logic implemented in LEs. The Quartus II software combines ESBs and LEs automatically to create larger CAMs.

CAM supports writing “don’t care” bits into words of the memory. The “don’t-care” bit can be used as a mask for CAM comparisons; any bit set to “don’t-care” has no effect on matches.

The output of the CAM can be encoded or unencoded. When encoded, the ESB outputs an encoded address of the data’s location. For instance, if the data is located in address 12, the ESB output is 12. When unencoded, the ESB uses its 16 outputs to show the location of the data over two clock cycles. In this case, if the data is located in address 12, the 12th output line goes high. When using unencoded outputs, two clock cycles are required to read the output because a 16-bit output bus is used to show the status of 32 words.

The encoded output is better suited for designs that ensure duplicate data is not written into the CAM. If duplicate data is written into two locations, the CAM’s output will be incorrect. If the CAM may contain duplicate data, the unencoded output is a better solution; CAM with unencoded outputs can distinguish multiple data locations.

CAM can be pre-loaded with data during configuration, or it can be written during system operation. In most cases, two clock cycles are required to write each word into CAM. When “don’t-care” bits are used, a third clock cycle is required.

For more information on APEX 20KE devices and CAM, see *Application Note 119 (Implementing High-Speed Search Applications with APEX CAM)*.

Driving Signals to the ESB

ESBs provide flexible options for driving control signals. Different clocks can be used for the ESB inputs and outputs. Registers can be inserted independently on the data input, data output, read address, write address, WE, and RE signals. The global signals and the local interconnect can drive the WE and RE signals. The global signals, dedicated clock pins, and local interconnect can drive the ESB clock signals. Because the LEs drive the local interconnect, the LEs can control the WE and RE signals and the ESB clock, clock enable, and asynchronous clear signals. [Figure 24](#) shows the ESB control signal generation logic.

Figure 24. ESB Control Signal Generation

Note to Figure 24:

(1) APEX 20KE devices have four dedicated clocks.

An ESB is fed by the local interconnect, which is driven by adjacent LEs (for high-speed connection to the ESB) or the MegaLAB interconnect. The ESB can drive the local, MegaLAB, or FastTrack Interconnect routing structure to drive LEs and IOEs in the same MegaLAB structure or anywhere in the device.

APEX 20KE devices include an enhanced IOE, which drives the FastRow interconnect. The FastRow interconnect connects a column I/O pin directly to the LAB local interconnect within two MegaLAB structures. This feature provides fast setup times for pins that drive high fan-outs with complex logic, such as PCI designs. For fast bidirectional I/O timing, LE registers using local routing can improve setup times and OE timing. The APEX 20KE IOE also includes direct support for open-drain operation, giving faster clock-to-output for open-drain signals. Some programmable delays in the APEX 20KE IOE offer multiple levels of delay to fine-tune setup and hold time requirements. The Quartus II software compiler can set these delays automatically to minimize setup time while providing a zero hold time.

Table 11 describes the APEX 20KE programmable delays and their logic options in the Quartus II software.

Table 11. APEX 20KE Programmable Delay Chains	
Programmable Delays	Quartus II Logic Option
Input Pin to Core Delay	Decrease input delay to internal cells
Input Pin to Input Register Delay	Decrease input delay to input registers
Core to Output Register Delay	Decrease input delay to output register
Output Register t_{CO} Delay	Increase delay to output pin
Clock Enable Delay	Increase clock enable delay

The register in the APEX 20KE IOE can be programmed to power-up high or low after configuration is complete. If it is programmed to power-up low, an asynchronous clear can control the register. If it is programmed to power-up high, an asynchronous preset can control the register. **Figure 26** shows how fast bidirectional I/O pins are implemented in APEX 20KE devices. This feature is useful for cases where the APEX 20KE device controls an active-low input or another device; it prevents inadvertent activation of the input upon power-up.

For designs that require both a multiplied and non-multiplied clock, the clock trace on the board can be connected to CLK2p. Table 14 shows the combinations supported by the ClockLock and ClockBoost circuitry. The CLK2p pin can feed both the ClockLock and ClockBoost circuitry in the APEX 20K device. However, when both circuits are used, the other clock pin (CLK1p) cannot be used.

Table 14. Multiplication Factor Combinations

Clock 1	Clock 2
×1	×1
×1, ×2	×2
×1, ×2, ×4	×4

APEX 20KE ClockLock Feature

APEX 20KE devices include an enhanced ClockLock feature set. These devices include up to four PLLs, which can be used independently. Two PLLs are designed for either general-purpose use or LVDS use (on devices that support LVDS I/O pins). The remaining two PLLs are designed for general-purpose use. The EP20K200E and smaller devices have two PLLs; the EP20K300E and larger devices have four PLLs.

The following sections describe some of the features offered by the APEX 20KE PLLs.

External PLL Feedback

The ClockLock circuit's output can be driven off-chip to clock other devices in the system; further, the feedback loop of the PLL can be routed off-chip. This feature allows the designer to exercise fine control over the I/O interface between the APEX 20KE device and another high-speed device, such as SDRAM.

Clock Multiplication

The APEX 20KE ClockBoost circuit can multiply or divide clocks by a programmable number. The clock can be multiplied by $m/(n \times k)$ or $m/(n \times v)$, where m and k range from 2 to 160, and n and v range from 1 to 16. Clock multiplication and division can be used for time-domain multiplexing and other functions, which can reduce design LE requirements.

Table 18. APEX 20KE Clock Input & Output Parameters (Part 1 of 2) *Note (1)*

Symbol	Parameter	I/O Standard	-1X Speed Grade		-2X Speed Grade		Units
			Min	Max	Min	Max	
f_{VCO} (4)	Voltage controlled oscillator operating range		200	500	200	500	MHz
f_{CLOCK0}	Clock0 PLL output frequency for internal use		1.5	335	1.5	200	MHz
f_{CLOCK1}	Clock1 PLL output frequency for internal use		20	335	20	200	MHz
f_{CLOCK0_EXT}	Output clock frequency for external clock0 output	3.3-V LVTTTL	1.5	245	1.5	226	MHz
		2.5-V LVTTTL	1.5	234	1.5	221	MHz
		1.8-V LVTTTL	1.5	223	1.5	216	MHz

		SSTL-3 Class II	1.5	149	1.5	146	MHz
		LVDS	1.5	420	1.5	350	MHz
f_{CLOCK1_EXT}	Output clock frequency for external clock1 output	3.3-V LVTTTL	20	245	20	226	MHz
		2.5-V LVTTTL	20	234	20	221	MHz
		1.8-V LVTTTL	20	223	20	216	MHz
		GTL+	20	205	20	193	MHz
		SSTL-2 Class I	20	158	20	157	MHz
		SSTL-2 Class II	20	142	20	142	MHz
		SSTL-3 Class I	20	166	20	162	MHz
		SSTL-3 Class II	20	149	20	146	MHz
		LVDS	20	420	20	350	MHz

The APEX 20K device instruction register length is 10 bits. The APEX 20K device USERCODE register length is 32 bits. [Tables 20 and 21](#) show the boundary-scan register length and device IDCODE information for APEX 20K devices.

Table 20. APEX 20K Boundary-Scan Register Length

Device	Boundary-Scan Register Length
EP20K30E	420
EP20K60E	624
EP20K100	786
EP20K100E	774
EP20K160E	984
EP20K200	1,176
EP20K200E	1,164
EP20K300E	1,266
EP20K400	1,536
EP20K400E	1,506
EP20K600E	1,806
EP20K1000E	2,190
EP20K1500E	1 (1)

Note to [Table 20](#):

- (1) This device does not support JTAG boundary scan testing.

Figure 32. APEX 20K AC Test Conditions *Note (1)*

Note to Figure 32:

- (1) Power supply transients can affect AC measurements. Simultaneous transitions of multiple outputs should be avoided for accurate measurement. Threshold tests must not be performed under AC conditions. Large-amplitude, fast-ground-current transients normally occur as the device outputs discharge the load capacitances. When these transients flow through the parasitic inductance between the device ground pin and the test system ground, significant reductions in observable noise immunity can result.

Operating Conditions

Tables 23 through 26 provide information on absolute maximum ratings, recommended operating conditions, DC operating conditions, and capacitance for 2.5-V APEX 20K devices.

Table 23. APEX 20K 5.0-V Tolerant Device Absolute Maximum Ratings *Notes (1), (2)*

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CCINT}	Supply voltage	With respect to ground (3)	–0.5	3.6	V
V_{CCIO}			–0.5	4.6	V
V_I			–2.0	5.75	V
I_{OUT}	DC output current, per pin		–25	25	mA
T_{STG}	Storage temperature	No bias	–65	150	°C
T_{AMB}	Ambient temperature	Under bias	–65	135	°C
T_J	Junction temperature	PQFP, RQFP, TQFP, and BGA packages, under bias		135	°C
		Ceramic PGA packages, under bias		150	°C

Note to [Tables 32 and 33](#):

(1) These timing parameters are sample-tested only.

[Tables 34 through 37](#) show APEX 20KE LE, ESB, routing, and functional timing microparameters for the f_{MAX} timing model.

Table 34. APEX 20KE LE Timing Microparameters

Symbol	Parameter
t_{SU}	LE register setup time before clock
t_H	LE register hold time after clock
t_{CO}	LE register clock-to-output delay
t_{LUT}	LUT delay for data-in to data-out

Table 35. APEX 20KE ESB Timing Microparameters

Symbol	Parameter

t _{XZBIDIR}		6.10		6.74		7.10	ns
t _{ZXBIDIR}		6.10		6.74		7.10	ns
t _{INSUBIDIRPLL}	2.26		2.68		-		ns
t _{INHBIDIRPLL}	0.00		0.00		-		ns
t _{OUTCOBIDIRPLL}	0.50	2.62	0.50	2.91	-	-	ns
t _{XZBIDIRPLL}		3.21		3.59		-	ns
t _{ZXBIDIRPLL}		3.21		3.59		-	ns

Tables 97 through 102 describe f_{MAX} LE Timing Microparameters, f_{MAX} ESB Timing Microparameters, f_{MAX} Routing Delays, Minimum Pulse Width Timing Parameters, External Timing Parameters, and External Bidirectional Timing Parameters for EP20K1000E APEX 20KE devices.

Table 97. EP20K1000E f_{MAX} LE Timing Microparameters

Symbol	-1 Speed Grade		-2 Speed Grade		-3 Speed Grade		Unit
	Min	Max	Min	Max	Min	Max	
t_{SU}	0.25		0.25		0.25		ns
t_H	0.25		0.25		0.25		ns
t_{CO}		0.28		0.32		0.33	ns
t_{LUT}		0.80		0.95		1.13	ns

Revision History

The information contained in the *APEX 20K Programmable Logic Device Family Data Sheet* version 5.1 supersedes information published in previous versions.

Version 5.1

APEX 20K Programmable Logic Device Family Data Sheet version 5.1 contains the following changes:

- In version 5.0, the VI input voltage spec was updated in Table 28 on page 63.
- In version 5.0, *Note (5)* to Tables 27 through 30 was revised.
- Added *Note (2)* to Figure 21 on page 33.

Version 5.0

APEX 20K Programmable Logic Device Family Data Sheet version 5.0 contains the following changes:

- Updated Tables 23 through 26. Removed 2.5-V operating condition tables because all APEX 20K devices are now 5.0-V tolerant.
- Updated conditions in Tables 33, 38 and 39.
- Updated data for $t_{ESB\text{DATAH}}$ parameter.

Version 4.3

APEX 20K Programmable Logic Device Family Data Sheet version 4.3 contains the following changes:

- Updated Figure 20.
- Updated *Note (2)* to Table 13.
- Updated notes to Tables 27 through 30.

Version 4.2

APEX 20K Programmable Logic Device Family Data Sheet version 4.2 contains the following changes:

- Updated Figure 29.
- Updated *Note (1)* to Figure 29.
