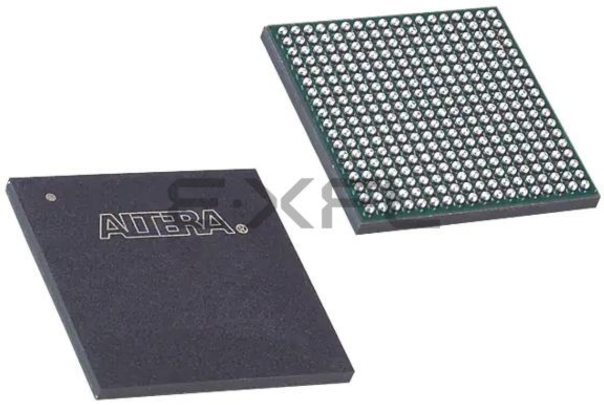
Intel - EP20K100FI324-2XV Datasheet



Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	416
Number of Logic Elements/Cells	4160
Total RAM Bits	53248
Number of I/O	252
Number of Gates	263000
Voltage - Supply	2.375V ~ 2.625V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	324-BGA
Supplier Device Package	324-FBGA (19x19)
Purchase URL	https://www.e-xfl.com/product-detail/intel/ep20k100fi324-2xv

General Description

APEX^{TM} 20K devices are the first PLDs designed with the MultiCore architecture, which combines the strengths of LUT-based and product-term-based devices with an enhanced memory structure. LUT-based logic provides optimized performance and efficiency for data-path, register-intensive, mathematical, or digital signal processing (DSP) designs. Product-term-based logic is optimized for complex combinatorial paths, such as complex state machines. LUT- and product-term-based logic combined with memory functions and a wide variety of MegaCore and AMPP functions make the APEX 20K device architecture uniquely suited for system-on-a-programmable-chip designs. Applications historically requiring a combination of LUT-, product-term-, and memory-based devices can now be integrated into one APEX 20K device.

APEX 20KE devices are a superset of APEX 20K devices and include additional features such as advanced I/O standard support, CAM, additional global clocks, and enhanced ClockLock clock circuitry. In addition, APEX 20KE devices extend the APEX 20K family to 1.5 million gates. APEX 20KE devices are denoted with an “E” suffix in the device name (e.g., the EP20K1000E device is an APEX 20KE device). Table 8 compares the features included in APEX 20K and APEX 20KE devices.

LE Operating Modes

The APEX 20K LE can operate in one of the following three modes:

- Normal mode
- Arithmetic mode
- Counter mode

Each mode uses LE resources differently. In each mode, seven available inputs to the LE—the four data inputs from the LAB local interconnect, the feedback from the programmable register, and the carry-in and cascade-in from the previous LE—are directed to different destinations to implement the desired logic function. LAB-wide signals provide clock, asynchronous clear, asynchronous preset, asynchronous load, synchronous clear, synchronous load, and clock enable control for the register. These LAB-wide signals are available in all LE modes.

The Quartus II software, in conjunction with parameterized functions such as LPM and DesignWare functions, automatically chooses the appropriate mode for common functions such as counters, adders, and multipliers. If required, the designer can also create special-purpose functions that specify which LE operating mode to use for optimal performance. Figure 8 shows the LE operating modes.

Implementing Logic in ROM

In addition to implementing logic with product terms, the ESB can implement logic functions when it is programmed with a read-only pattern during configuration, creating a large LUT. With LUTs, combinatorial functions are implemented by looking up the results, rather than by computing them. This implementation of combinatorial functions can be faster than using algorithms implemented in general logic, a performance advantage that is further enhanced by the fast access times of ESBs. The large capacity of ESBs enables designers to implement complex functions in one logic level without the routing delays associated with linked LEs or distributed RAM blocks. Parameterized functions such as LPM functions can take advantage of the ESB automatically. Further, the Quartus II software can implement portions of a design with ESBs where appropriate.

Programmable Speed/Power Control

APEX 20K ESBs offer a high-speed mode that supports very fast operation on an ESB-by-ESB basis. When high speed is not required, this feature can be turned off to reduce the ESB's power dissipation by up to 50%. ESBs that run at low power incur a nominal timing delay adder. This Turbo Bit™ option is available for ESBs that implement product-term logic or memory functions. An ESB that is not used will be powered down so that it does not consume DC current.

Designers can program each ESB in the APEX 20K device for either high-speed or low-power operation. As a result, speed-critical paths in the design can run at high speed, while the remaining paths operate at reduced power.

I/O Structure

The APEX 20K IOE contains a bidirectional I/O buffer and a register that can be used either as an input register for external data requiring fast setup times, or as an output register for data requiring fast clock-to-output performance. IOEs can be used as input, output, or bidirectional pins. For fast bidirectional I/O timing, LE registers using local routing can improve setup times and OE timing. The Quartus II software Compiler uses the programmable inversion option to invert signals from the row and column interconnect automatically where appropriate. Because the APEX 20K IOE offers one output enable per pin, the Quartus II software Compiler can emulate open-drain operation efficiently.

The APEX 20K IOE includes programmable delays that can be activated to ensure zero hold times, minimum clock-to-output times, input IOE register-to-core register transfers, or core-to-output IOE register transfers. A path in which a pin directly drives a register may require the delay to ensure zero hold time, whereas a path in which a pin drives a register through combinatorial logic may not require the delay.

Table 10 describes the APEX 20K programmable delays and their logic options in the Quartus II software.

Table 10. APEX 20K Programmable Delay Chains

Programmable Delays	Quartus II Logic Option
Input pin to core delay	Decrease input delay to internal cells
Input pin to input register delay	Decrease input delay to input register
Core to output register delay	Decrease input delay to output register
Output register t_{CO} delay	Increase delay to output pin

The Quartus II software compiler can program these delays automatically to minimize setup time while providing a zero hold time. Figure 25 shows how fast bidirectional I/Os are implemented in APEX 20K devices.

The register in the APEX 20K IOE can be programmed to power-up high or low after configuration is complete. If it is programmed to power-up low, an asynchronous clear can control the register. If it is programmed to power-up high, the register cannot be asynchronously cleared or preset. This feature is useful for cases where the APEX 20K device controls an active-low input or another device; it prevents inadvertent activation of the input upon power-up.

Under hot socketing conditions, APEX 20KE devices will not sustain any damage, but the I/O pins will drive out.

MultiVolt I/O Interface

The APEX device architecture supports the MultiVolt I/O interface feature, which allows APEX devices in all packages to interface with systems of different supply voltages. The devices have one set of `VCC` pins for internal operation and input buffers (`VCCINT`), and another set for I/O output drivers (`VCCIO`).

The APEX 20K `VCCINT` pins must always be connected to a 2.5 V power supply. With a 2.5-V V_{CCINT} level, input pins are 2.5-V, 3.3-V, and 5.0-V tolerant. The `VCCIO` pins can be connected to either a 2.5-V or 3.3-V power supply, depending on the output requirements. When `VCCIO` pins are connected to a 2.5-V power supply, the output levels are compatible with 2.5-V systems. When the `VCCIO` pins are connected to a 3.3-V power supply, the output high is 3.3 V and is compatible with 3.3-V or 5.0-V systems.

Table 12 summarizes 5.0-V tolerant APEX 20K MultiVolt I/O support.

Table 12. 5.0-V Tolerant APEX 20K MultiVolt I/O Support

V_{CCIO} (V)	Input Signals (V)			Output Signals (V)		
	2.5	3.3	5.0	2.5	3.3	5.0
2.5	✓	✓(1)	✓(1)	✓		
3.3	✓	✓	✓(1)	✓(2)	✓	✓

Notes to Table 12:

(1) The PCI clamping diode must be disabled to drive an input with voltages higher than V_{CCIO}.

(2) When V_{CCIO} = 3.3 V, an APEX 20K device can drive a 2.5-V device with 3.3-V tolerant inputs.

Open-drain output pins on 5.0-V tolerant APEX 20K devices (with a pull-up resistor to the 5.0-V supply) can drive 5.0-V CMOS input pins that require a V_{IH} of 3.5 V. When the pin is inactive, the trace will be pulled up to 5.0 V by the resistor. The open-drain pin will only drive low or tri-state; it will never drive high. The rise time is dependent on the value of the pull-up resistor and load impedance. The I_{OL} current specification should be considered when selecting a pull-up resistor.

Table 15. APEX 20K ClockLock & ClockBoost Parameters for -1 Speed-Grade Devices (Part 2 of 2)

Symbol	Parameter	Min	Max	Unit
t_{SKEW}	Skew delay between related ClockLock/ClockBoost-generated clocks		500	ps
t_{JITTER}	Jitter on ClockLock/ClockBoost-generated clock *(5)*		200	ps
$t_{INCLKSTB}$	Input clock stability (measured between adjacent clocks)		50	ps

Notes to Table 15:

(1) The PLL input frequency range for the EP20K100-1X device for 1x multiplication is 25 MHz to 175 MHz.

(2) All input clock specifications must be met. The PLL may not lock onto an incoming clock if the clock specifications are not met, creating an erroneous clock within the device.

(3) During device configuration, the ClockLock and ClockBoost circuitry is configured first. If the incoming clock is supplied during configuration, the ClockLock and ClockBoost circuitry locks during configuration, because the lock time is less than the configuration time.

(4) The jitter specification is measured under long-term observation.

(5) If the input clock stability is 100 ps, t_{JITTER} is 250 ps.

Table 16 summarizes the APEX 20K ClockLock and ClockBoost parameters for -2 speed grade devices.

Table 16. APEX 20K ClockLock & ClockBoost Parameters for -2 Speed Grade Devices

Symbol	Parameter	Min	Max	Unit
f_{OUT}	Output frequency	25	170	MHz
f_{CLK1}	Input clock frequency (ClockBoost clock multiplication factor equals 1)	25	170	MHz
f_{CLK2}	Input clock frequency (ClockBoost clock multiplication factor equals 2)	16	80	MHz
f_{CLK4}	Input clock frequency (ClockBoost clock multiplication factor equals 4)	10	34	MHz
$t_{OUTDUTY}$	Duty cycle for ClockLock/ClockBoost-generated clock	40	60	%
f_{CLKDEV}	Input deviation from user specification in the Quartus II software (ClockBoost clock multiplication factor equals one) *(1)*		25,000 *(2)*	PPM
t_R	Input rise time		5	ns
t_F	Input fall time		5	ns
t_{LOCK}	Time required for ClockLock/ ClockBoost to acquire lock *(3)*		10	µs
t_{SKEW}	Skew delay between related ClockLock/ ClockBoost-generated clock	500	500	ps
t_{JITTER}	Jitter on ClockLock/ ClockBoost-generated clock *(4)*		200	ps
$t_{INCLKSTB}$	Input clock stability (measured between adjacent clocks)		50	ps

Table 24. APEX 20K 5.0-V Tolerant Device Recommended Operating Conditions *Note (2)*

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CCINT}	Supply voltage for internal logic and input buffers	*(4)*, *(5)*	2.375 (2.375)	2.625 (2.625)	V
V_{CCIO}	Supply voltage for output buffers, 3.3-V operation	*(4)*, *(5)*	3.00 (3.00)	3.60 (3.60)	V
	Supply voltage for output buffers, 2.5-V operation	*(4)*, *(5)*	2.375 (2.375)	2.625 (2.625)	V
V_I	Input voltage	*(3)*, *(6)*	–0.5	5.75	V
V_O	Output voltage		0	V_{CCIO}	V
T_J	Junction temperature	For commercial use	0	85	° C
		For industrial use	–40	100	° C
t_R	Input rise time			40	ns
t_F	Input fall time			40	ns

Table 25. APEX 20K 5.0-V Tolerant Device DC Operating Conditions (Part 1 of 2) *Notes (2), (7), (8)*

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IH}	High-level input voltage		1.7, 0.5 × V_{CCIO} *(9)*		5.75	V
V_{IL}	Low-level input voltage		–0.5		0.8, 0.3 × V_{CCIO} *(9)*	V
V_{OH}	3.3-V high-level TTL output voltage	I_{OH} = –8 mA DC, V_{CCIO} = 3.00 V *(10)*	2.4			V
	3.3-V high-level CMOS output voltage	I_{OH} = –0.1 mA DC, V_{CCIO} = 3.00 V *(10)*	V_{CCIO} – 0.2			V
	3.3-V high-level PCI output voltage	I_{OH} = –0.5 mA DC, V_{CCIO} = 3.00 to 3.60 V *(10)*	0.9 × V_{CCIO}			V
	2.5-V high-level output voltage	I_{OH} = –0.1 mA DC, V_{CCIO} = 2.30 V *(10)*	2.1			V
		I_{OH} = –1 mA DC, V_{CCIO} = 2.30 V *(10)*	2.0			V
		I_{OH} = –2 mA DC, V_{CCIO} = 2.30 V *(10)*	1.7			V

Table 25. APEX 20K 5.0-V Tolerant Device DC Operating Conditions (Part 2 of 2) *Notes (2), (7), (8)*

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{OL}	3.3-V low-level TTL output voltage	I_{OL} = 12 mA DC, V_{CCIO} = 3.00 V *(11)*			0.45	V
	3.3-V low-level CMOS output voltage	I_{OL} = 0.1 mA DC, V_{CCIO} = 3.00 V *(11)*			0.2	V
	3.3-V low-level PCI output voltage	I_{OL} = 1.5 mA DC, V_{CCIO} = 3.00 to 3.60 V *(11)*			0.1 × V_{CCIO}	V
	2.5-V low-level output voltage	I_{OL} = 0.1 mA DC, V_{CCIO} = 2.30 V *(11)*			0.2	V
		I_{OL} = 1 mA DC, V_{CCIO} = 2.30 V *(11)*			0.4	V
		I_{OL} = 2 mA DC, V_{CCIO} = 2.30 V *(11)*			0.7	V
I_I	Input pin leakage current	V_I = 5.75 to –0.5 V	–10		10	µA
I_{OZ}	Tri-stated I/O pin leakage current	V_O = 5.75 to –0.5 V	–10		10	µA
I_{CC0}	V_{CC} supply current (standby) (All ESBs in power-down mode)	V_I = ground, no load, no toggling inputs, -1 speed grade *(12)*		10		mA
		V_I = ground, no load, no toggling inputs, -2, -3 speed grades *(12)*		5		mA
R_{CONF}	Value of I/O pin pull-up resistor before and during configuration	V_{CCIO} = 3.0 V *(13)*	20		50	W
		V_{CCIO} = 2.375 V *(13)*	30		80	W

Table 26. APEX 20K 5.0-V Tolerant Device Capacitance *Notes (2), (14)*

Symbol	Parameter	Conditions	Min	Max	Unit
C_{IN}	Input capacitance	V_{IN} = 0 V, f = 1.0 MHz		8	pF
C_{INCLK}	Input capacitance on dedicated clock pin	V_{IN} = 0 V, f = 1.0 MHz		12	pF
C_{OUT}	Output capacitance	V_{OUT} = 0 V, f = 1.0 MHz		8	pF

Notes to Tables 23 through 26:

(1) See the *Operating Requirements for Altera Devices Data Sheet*.
(2) All APEX 20K devices are 5.0-V tolerant.
(3) Minimum DC input is –0.5 V. During transitions, the inputs may undershoot to –2.0 V or overshoot to 5.75 V for input currents less than 100 mA and periods shorter than 20 ns.
(4) Numbers in parentheses are for industrial-temperature-range devices.
(5) Maximum V_{CC} rise time is 100 ms, and V_{CC} must rise monotonically.
(6) All pins, including dedicated inputs, clock I/O, and JTAG pins, may be driven before V_{CCINT} and V_{CCIO} are powered.
(7) Typical values are for T_A= 25° C, V_{CCINT} = 2.5 V, and V_{CCIO} = 2.5 or 3.3 V.
(8) These values are specified in the APEX 20K device recommended operating conditions, shown in Table 26 on page 62.
(9) The APEX 20K input buffers are compatible with 2.5-V and 3.3-V (LVTTL and LVCMOS) signals. Additionally, the input buffers are 3.3-V PCI compliant when V_{CCIO} and V_{CCINT} meet the relationship shown in Figure 33 on page 68.
(10) The I_{OH} parameter refers to high-level TTL, PCI or CMOS output current.
(11) The I_{OL} parameter refers to low-level TTL, PCI, or CMOS output current. This parameter applies to open-drain pins as well as output pins.
(12) This value is specified for normal device operation. The value may vary during power-up.
(13) Pin pull-up resistance values will be lower if an external source drives the pin higher than V_{CCIO}.
(14) Capacitance is sample-tested only.

Tables 27 through 30 provide information on absolute maximum ratings, recommended operating conditions, DC operating conditions, and capacitance for 1.8-V APEX 20KE devices.

Table 27. APEX 20KE Device Absolute Maximum Ratings *Note (1)*

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CCINT}	Supply voltage	With respect to ground *(2)*	–0.5	2.5	V
V_{CCIO}			–0.5	4.6	V
V_I	DC input voltage		–0.5	4.6	V
I_{OUT}	DC output current, per pin		–25	25	mA
T_{STG}	Storage temperature	No bias	–65	150	° C
T_{AMB}	Ambient temperature	Under bias	–65	135	° C
T_J	Junction temperature	PQFP, RQFP, TQFP, and BGA packages, under bias		135	° C
		Ceramic PGA packages, under bias		150	° C

Table 28. APEX 20KE Device Recommended Operating Conditions

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CCINT}	Supply voltage for internal logic and input buffers	*(3)*, *(4)*	1.71 (1.71)	1.89 (1.89)	V
V_{CCIO}	Supply voltage for output buffers, 3.3-V operation	*(3)*, *(4)*	3.00 (3.00)	3.60 (3.60)	V
	Supply voltage for output buffers, 2.5-V operation	*(3)*, *(4)*	2.375 (2.375)	2.625 (2.625)	V
	Supply voltage for output buffers, 1.8-V operation	*(3)*, *(4)*	1.71 (1.71)	1.89 (1.89)	V
V_I	Input voltage	*(5)*, *(6)*	–0.5	4.0	V
V_O	Output voltage		0	V_{CCIO}	V
T_J	Junction temperature	For commercial use	0	85	° C
		For industrial use	–40	100	° C
t_R	Input rise time			40	ns
t_F	Input fall time			40	ns

For DC Operating Specifications on APEX 20KE I/O standards, please refer to *Application Note 117 (Using Selectable I/O Standards in Altera Devices).*

Table 30. APEX 20KE Device Capacitance Note (15)

Symbol	Parameter	Conditions	Min	Max	Unit
C_{IN}	Input capacitance	V_{IN} = 0 V, f = 1.0 MHz		8	pF
C_{INCLK}	Input capacitance on dedicated clock pin	V_{IN} = 0 V, f = 1.0 MHz		12	pF
C_{OUT}	Output capacitance	V_{OUT} = 0 V, f = 1.0 MHz		8	pF

Notes to Tables 27 through 30:

(1) See the *Operating Requirements for Altera Devices Data Sheet*.

(2) Minimum DC input is –0.5 V. During transitions, the inputs may undershoot to –2.0 V or overshoot to 5.75 V for input currents less than 100 mA and periods shorter than 20 ns.

(3) Numbers in parentheses are for industrial-temperature-range devices.

(4) Maximum V_{CC} rise time is 100 ms, and V_{CC} must rise monotonically.

(5) Minimum DC input is –0.5 V. During transitions, the inputs may undershoot to –2.0 V or overshoot to the voltage shown in the following table based on input duty cycle for input currents less than 100 mA. The overshoot is dependent upon duty cycle of the signal. The DC case is equivalent to 100% duty cycle.

Vin	Max. Duty Cycle
4.0V	100% (DC)
4.1	90%
4.2	50%
4.3	30%
4.4	17%
4.5	10%

(6) All pins, including dedicated inputs, clock, I/O, and JTAG pins, may be driven before V_{CCINT} and V_{CCIO} are powered.

(7) Typical values are for T_A = 25° C, V_{CCINT} = 1.8 V, and V_{CCIO} = 1.8 V, 2.5 V or 3.3 V.

(8) These values are specified under the APEX 20KE device recommended operating conditions, shown in Table 24 on page 60.

(9) Refer to *Application Note 117 (Using Selectable I/O Standards in Altera Devices)* for the V_{IH}, V_{IL}, V_{OH}, V_{OL}, and I_I parameters when VCCIO = 1.8 V.

(10) The APEX 20KE input buffers are compatible with 1.8-V, 2.5-V and 3.3-V (LVTTL and LVCMOS) signals. Additionally, the input buffers are 3.3-V PCI compliant. Input buffers also meet specifications for GTL+, CTT, AGP, SSTL-2, SSTL-3, and HSTL.

(11) The I_{OH} parameter refers to high-level TTL, PCI, or CMOS output current.

(12) The I_{OL} parameter refers to low-level TTL, PCI, or CMOS output current. This parameter applies to open-drain pins as well as output pins.

(13) This value is specified for normal device operation. The value may vary during power-up.

(14) Pin pull-up resistance values will be lower if an external source drives the pin higher than V_{CCIO}.

(15) Capacitance is sample-tested only.

Figure 33 shows the relationship between V_{CCIO} and V_{CCINT} for 3.3-V PCI compliance on APEX 20K devices.

Figure 33. Relationship between V_{CCIO} & V_{CCINT} for 3.3-V PCI Compliance

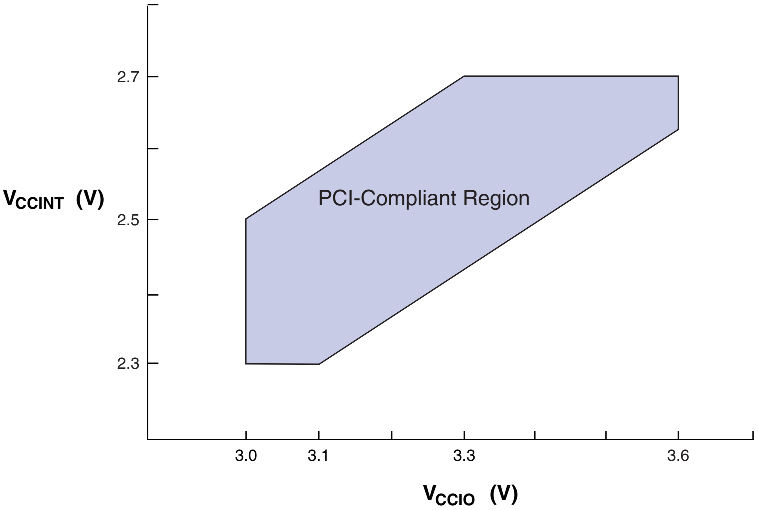


Figure 34 shows the typical output drive characteristics of APEX 20K devices with 3.3-V and 2.5-V V_{CCIO}. The output driver is compatible with the 3.3-V ***PCI Local Bus Specification, Revision 2.2*** (when `VCCIO` pins are connected to 3.3 V). 5-V tolerant APEX 20K devices in the -1 speed grade are 5-V PCI compliant over all operating conditions.

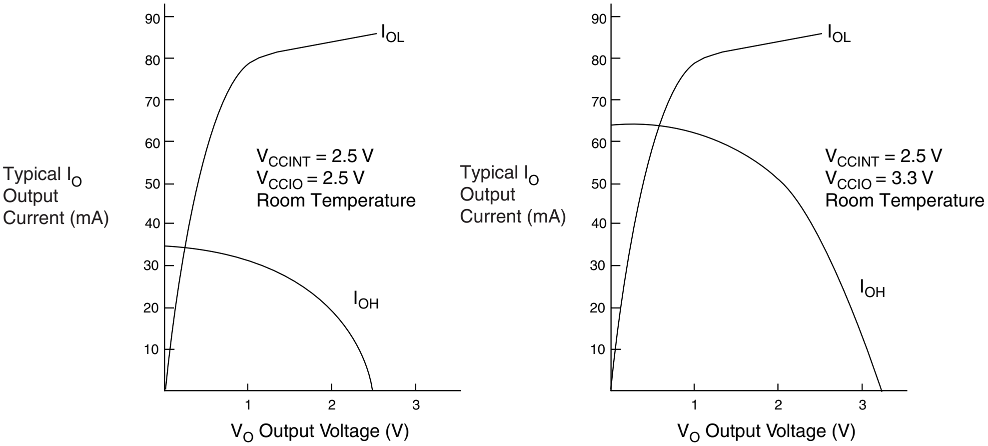
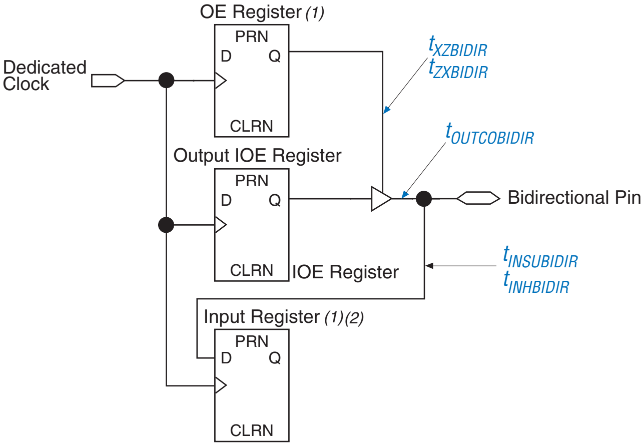
Figure 34. Output Drive Characteristics of APEX 20K Device *Note (1)*



Note to Figure 34:

(1) These are transient (AC) currents.

Figure 40. Synchronous Bidirectional Pin External Timing



Notes to Figure 40:

(1) The output enable and input registers are LE registers in the LAB adjacent to a bidirectional row pin. The output enable register is set with "Output Enable Routing= Signal-Pin" option in the Quartus II software.

(2) The LAB adjacent input register is set with "Decrease Input Delay to Internal Cells= Off". This maintains a zero hold time for lab adjacent registers while giving a fast, position independent setup time. A faster setup time with zero hold time is possible by setting "Decrease Input Delay to Internal Cells= ON" and moving the input register farther away from the bidirectional pin. The exact position where zero hold occurs with the minimum setup time, varies with device density and speed grade.

Table 31 describes the f_{MAX} timing parameters shown in Figure 36 on page 68.

Table 31. APEX 20K f_{MAX} Timing Parameters (Part 1 of 2)

Symbol	Parameter
t_{SU}	LE register setup time before clock
t_{H}	LE register hold time after clock
t_{CO}	LE register clock-to-output delay
t_{LUT}	LUT delay for data-in
t_{ESBRC}	ESB Asynchronous read cycle time
t_{ESBWC}	ESB Asynchronous write cycle time
$t_{ESBWESU}$	ESB WE setup time before clock when using input register
$t_{ESBDATASU}$	ESB data setup time before clock when using input register
$t_{ESBDATAH}$	ESB data hold time after clock when using input register
$t_{ESBADDRSU}$	ESB address setup time before clock when using input registers
$t_{ESBDATACO1}$	ESB clock-to-output delay when using output registers

Table 42. EP20K400 f_{MAX} Timing Parameters

Symbol	-1 Speed Grade		-2 Speed Grade		-3 Speed Grade		Units
	Min	Max	Min	Max	Min	Max

Power Consumption

To estimate device power consumption, use the interactive power calculator on the Altera web site at **http://www.altera.com**.

Configuration & Operation

The APEX 20K architecture supports several configuration schemes. This section summarizes the device operating modes and available device configuration schemes.

Operating Modes

The APEX architecture uses SRAM configuration elements that require configuration data to be loaded each time the circuit powers up. The process of physically loading the SRAM data into the device is called configuration. During initialization, which occurs immediately after configuration, the device resets registers, enables I/O pins, and begins to operate as a logic device. The I/O pins are tri-stated during power-up, and before and during configuration. Together, the configuration and initialization processes are called *command mode*; normal device operation is called *user mode*.

Before and during device configuration, all I/O pins are pulled to V_{CCIO} by a built-in weak pull-up resistor.

SRAM configuration elements allow APEX 20K devices to be reconfigured in-circuit by loading new configuration data into the device. Real-time reconfiguration is performed by forcing the device into command mode with a device pin, loading different configuration data, reinitializing the device, and resuming user-mode operation. In-field upgrades can be performed by distributing new configuration files.

Configuration Schemes

The configuration data for an APEX 20K device can be loaded with one of five configuration schemes (see Table 111), chosen on the basis of the target application. An EPC2 or EPC16 configuration device, intelligent controller, or the JTAG port can be used to control the configuration of an APEX 20K device. When a configuration device is used, the system can configure automatically at system power-up.

Multiple APEX 20K devices can be configured in any of five configuration schemes by connecting the configuration enable (`nCE`) and configuration enable output (`nCEO`) pins on each device.

Table 111. Data Sources for Configuration

Configuration Scheme	Data Source
Configuration device	EPC1, EPC2, EPC16 configuration devices
Passive serial (PS)	MasterBlaster or ByteBlasterMV download cable or serial data source
Passive parallel asynchronous (PPA)	Parallel data source
Passive parallel synchronous (PPS)	Parallel data source
JTAG	MasterBlaster or ByteBlasterMV download cable or a microprocessor with a Jam or JBC File

For more information on configuration, see *Application Note 116 (Configuring APEX 20K, FLEX 10K, & FLEX 6000 Devices.)*

Device Pin-Outs

See the Altera web site **(http://www.altera.com)** or the ***Altera Digital Library*** for pin-out information
