### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

Product Status	Obsolete
Number of LABs/CLBs	640
Number of Logic Elements/Cells	6400
Total RAM Bits	81920
Number of I/O	271
Number of Gates	404000
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	356-LBGA
Supplier Device Package	356-BGA (35x35)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/intel/ep20k160ebc356-1">https://www.e-xfl.com/product-detail/intel/ep20k160ebc356-1</a>

**Table 2. Additional APEX 20K Device Features** *Note (1)*

Feature	EP20K300E	EP20K400	EP20K400E	EP20K600E	EP20K1000E	EP20K1500E
Maximum system gates	728,000	1,052,000	1,052,000	1,537,000	1,772,000	2,392,000
Typical gates	300,000	400,000	400,000	600,000	1,000,000	1,500,000
LEs	11,520	16,640	16,640	24,320	38,400	51,840
ESBs	72	104	104	152	160	216
Maximum RAM bits	147,456	212,992	212,992	311,296	327,680	442,368
Maximum macrocells	1,152	1,664	1,664	2,432	2,560	3,456
Maximum user I/O pins	408	502	488	588	708	808

*Note to Tables 1 and 2:*

- (1) The embedded IEEE Std. 1149.1 Joint Test Action Group (JTAG) boundary-scan circuitry contributes up to 57,000 additional gates.

## Additional Features

- Designed for low-power operation
  - 1.8-V and 2.5-V supply voltage (see Table 3)
  - MultiVolt™ I/O interface support to interface with 1.8-V, 2.5-V, 3.3-V, and 5.0-V devices (see Table 3)
  - ESB offering programmable power-saving mode

**Table 3. APEX 20K Supply Voltages**

Feature	Device	
	EP20K100 EP20K200 EP20K400	EP20K30E EP20K60E EP20K100E EP20K160E EP20K200E EP20K300E EP20K400E EP20K600E EP20K1000E EP20K1500E
Internal supply voltage ( $V_{CCINT}$ )	2.5 V	1.8 V
MultiVolt I/O interface voltage levels ( $V_{CCIO}$ )	2.5 V, 3.3 V, 5.0 V	1.8 V, 2.5 V, 3.3 V, 5.0 V (1)

*Note to Table 3:*

- (1) APEX 20KE devices can be 5.0-V tolerant by using an external resistor.

- Flexible clock management circuitry with up to four phase-locked loops (PLLs)
  - Built-in low-skew clock tree
  - Up to eight global clock signals
  - ClockLock<sup>®</sup> feature reducing clock delay and skew
  - ClockBoost<sup>®</sup> feature providing clock multiplication and division
  - ClockShift<sup>™</sup> programmable clock phase and delay shifting
- Powerful I/O features
  - Compliant with peripheral component interconnect Special Interest Group (PCI SIG) *PCI Local Bus Specification, Revision 2.2* for 3.3-V operation at 33 or 66 MHz and 32 or 64 bits
  - Support for high-speed external memories, including DDR SDRAM and ZBT SRAM (ZBT is a trademark of Integrated Device Technology, Inc.)
  - Bidirectional I/O performance ( $t_{CO} + t_{SU}$ ) up to 250 MHz
  - LVDS performance up to 840 Mbits per channel
  - Direct connection from I/O pins to local interconnect providing fast  $t_{CO}$  and  $t_{SU}$  times for complex logic
  - MultiVolt I/O interface support to interface with 1.8-V, 2.5-V, 3.3-V, and 5.0-V devices (see [Table 3](#))
  - Programmable clamp to  $V_{CCIO}$
  - Individual tri-state output enable control for each pin
  - Programmable output slew-rate control to reduce switching noise
  - Support for advanced I/O standards, including low-voltage differential signaling (LVDS), LVPECL, PCI-X, AGP, CTT, stub-series terminated logic (SSTL-3 and SSTL-2), Gunning transceiver logic plus (GTL+), and high-speed terminated logic (HSTL Class I)
  - Pull-up on I/O pins before and during configuration
- Advanced interconnect structure
  - Four-level hierarchical FastTrack<sup>®</sup> Interconnect structure providing fast, predictable interconnect delays
  - Dedicated carry chain that implements arithmetic functions such as fast adders, counters, and comparators (automatically used by software tools and megafunctions)
  - Dedicated cascade chain that implements high-speed, high-fan-in logic functions (automatically used by software tools and megafunctions)
  - Interleaved local interconnect allows one LE to drive 29 other LEs through the fast local interconnect
- Advanced packaging options
  - Available in a variety of packages with 144 to 1,020 pins (see [Tables 4 through 7](#))
  - FineLine BGA<sup>®</sup> packages maximize board space efficiency
- Advanced software support
  - Software design support and automatic place-and-route provided by the Altera<sup>®</sup> Quartus<sup>®</sup> II development system for

**Table 8. Comparison of APEX 20K & APEX 20KE Features**

Feature	APEX 20K Devices	APEX 20KE Devices
MultiCore system integration	Full support	Full support
SignalTap logic analysis	Full support	Full support
32/64-Bit, 33-MHz PCI	Full compliance in -1, -2 speed grades	Full compliance in -1, -2 speed grades
32/64-Bit, 66-MHz PCI	-	Full compliance in -1 speed grade
MultiVolt I/O	2.5-V or 3.3-V $V_{CCIO}$ $V_{CCIO}$ selected for device Certain devices are 5.0-V tolerant	1.8-V, 2.5-V, or 3.3-V $V_{CCIO}$ $V_{CCIO}$ selected block-by-block 5.0-V tolerant with use of external resistor
ClockLock support	Clock delay reduction 2× and 4× clock multiplication	Clock delay reduction $m/(n \times v)$ or $m/(n \times k)$ clock multiplication Drive ClockLock output off-chip External clock feedback ClockShift LVDS support Up to four PLLs ClockShift, clock phase adjustment
Dedicated clock and input pins	Six	Eight
I/O standard support	2.5-V, 3.3-V, 5.0-V I/O 3.3-V PCI Low-voltage complementary metal-oxide semiconductor (LVCMOS) Low-voltage transistor-to-transistor logic (LVTTL)	1.8-V, 2.5-V, 3.3-V, 5.0-V I/O 2.5-V I/O 3.3-V PCI and PCI-X 3.3-V Advanced Graphics Port (AGP) Center tap terminated (CTT) GTL+ LVCMOS LVTTL True-LVDS and LVPECL data pins (in EP20K300E and larger devices) LVDS and LVPECL signaling (in all BGA and FineLine BGA devices) LVDS and LVPECL data pins up to 156 Mbps (in -1 speed grade devices) HSTL Class I PCI-X SSTL-2 Class I and II SSTL-3 Class I and II
Memory support	Dual-port RAM FIFO RAM ROM	CAM Dual-port RAM FIFO RAM ROM

All APEX 20K devices are reconfigurable and are 100% tested prior to shipment. As a result, test vectors do not have to be generated for fault coverage purposes. Instead, the designer can focus on simulation and design verification. In addition, the designer does not need to manage inventories of different application-specific integrated circuit (ASIC) designs; APEX 20K devices can be configured on the board for the specific functionality required.

APEX 20K devices are configured at system power-up with data stored in an Altera serial configuration device or provided by a system controller. Altera offers in-system programmability (ISP)-capable EPC1, EPC2, and EPC16 configuration devices, which configure APEX 20K devices via a serial data stream. Moreover, APEX 20K devices contain an optimized interface that permits microprocessors to configure APEX 20K devices serially or in parallel, and synchronously or asynchronously. The interface also enables microprocessors to treat APEX 20K devices as memory and configure the device by writing to a virtual memory location, making reconfiguration easy.

After an APEX 20K device has been configured, it can be reconfigured in-circuit by resetting the device and loading new data. Real-time changes can be made during system operation, enabling innovative reconfigurable computing applications.

APEX 20K devices are supported by the Altera Quartus II development system, a single, integrated package that offers HDL and schematic design entry, compilation and logic synthesis, full simulation and worst-case timing analysis, SignalTap logic analysis, and device configuration. The Quartus II software runs on Windows-based PCs, Sun SPARCstations, and HP 9000 Series 700/800 workstations.

The Quartus II software provides NativeLink interfaces to other industry-standard PC- and UNIX workstation-based EDA tools. For example, designers can invoke the Quartus II software from within third-party design tools. Further, the Quartus II software contains built-in optimized synthesis libraries; synthesis tools can use these libraries to optimize designs for APEX 20K devices. For example, the Synopsys Design Compiler library, supplied with the Quartus II development system, includes DesignWare functions optimized for the APEX 20K architecture.

Each LE has two outputs that drive the local, MegaLAB, or FastTrack Interconnect routing structure. Each output can be driven independently by the LUT's or register's output. For example, the LUT can drive one output while the register drives the other output. This feature, called register packing, improves device utilization because the register and the LUT can be used for unrelated functions. The LE can also drive out registered and unregistered versions of the LUT output.

The APEX 20K architecture provides two types of dedicated high-speed data paths that connect adjacent LEs without using local interconnect paths: carry chains and cascade chains. A carry chain supports high-speed arithmetic functions such as counters and adders, while a cascade chain implements wide-input functions such as equality comparators with minimum delay. Carry and cascade chains connect LEs 1 through 10 in an LAB and all LABs in the same MegaLAB structure.

### *Carry Chain*

The carry chain provides a very fast carry-forward function between LEs. The carry-in signal from a lower-order bit drives forward into the higher-order bit via the carry chain, and feeds into both the LUT and the next portion of the carry chain. This feature allows the APEX 20K architecture to implement high-speed counters, adders, and comparators of arbitrary width. Carry chain logic can be created automatically by the Quartus II software Compiler during design processing, or manually by the designer during design entry. Parameterized functions such as library of parameterized modules (LPM) and DesignWare functions automatically take advantage of carry chains for the appropriate functions.

The Quartus II software Compiler creates carry chains longer than ten LEs by linking LABs together automatically. For enhanced fitting, a long carry chain skips alternate LABs in a MegaLAB™ structure. A carry chain longer than one LAB skips either from an even-numbered LAB to the next even-numbered LAB, or from an odd-numbered LAB to the next odd-numbered LAB. For example, the last LE of the first LAB in the upper-left MegaLAB structure carries to the first LE of the third LAB in the MegaLAB structure.

Figure 6 shows how an  $n$ -bit full adder can be implemented in  $n + 1$  LEs with the carry chain. One portion of the LUT generates the sum of two bits using the input signals and the carry-in signal; the sum is routed to the output of the LE. The register can be bypassed for simple adders or used for accumulator functions. Another portion of the LUT and the carry chain logic generates the carry-out signal, which is routed directly to the carry-in signal of the next-higher-order bit. The final carry-out signal is routed to an LE, where it is driven onto the local, MegaLAB, or FastTrack Interconnect routing structures.

## Cascade Chain

With the cascade chain, the APEX 20K architecture can implement functions with a very wide fan-in. Adjacent LUTs can compute portions of a function in parallel; the cascade chain serially connects the intermediate values. The cascade chain can use a logical AND or logical OR (via De Morgan's inversion) to connect the outputs of adjacent LEs. Each additional LE provides four more inputs to the effective width of a function, with a short cascade delay. Cascade chain logic can be created automatically by the Quartus II software Compiler during design processing, or manually by the designer during design entry.

Cascade chains longer than ten LEs are implemented automatically by linking LABs together. For enhanced fitting, a long cascade chain skips alternate LABs in a MegaLAB structure. A cascade chain longer than one LAB skips either from an even-numbered LAB to the next even-numbered LAB, or from an odd-numbered LAB to the next odd-numbered LAB. For example, the last LE of the first LAB in the upper-left MegaLAB structure carries to the first LE of the third LAB in the MegaLAB structure. Figure 7 shows how the cascade function can connect adjacent LEs to form functions with a wide fan-in.

**Figure 7. APEX 20K Cascade Chain**

**AND Cascade Chain**

**OR Cascade Chain**

**Table 9. APEX 20K Routing Scheme**

Source	Destination								
	Row I/O Pin	Column I/O Pin	LE	ESB	Local Interconnect	MegaLAB Interconnect	Row FastTrack Interconnect	Column FastTrack Interconnect	FastRow Interconnect

Local Interconnect	✓	✓	✓	✓					
MegaLAB Interconnect					✓				
Row FastTrack Interconnect						✓		✓	
Column FastTrack Interconnect						✓	✓		
FastRow Interconnect					✓ (1)				

**Note to Table 9:**

(1) This connection is supported in APEX 20KE devices only.

## Product-Term Logic

The product-term portion of the MultiCore architecture is implemented with the ESB. The ESB can be configured to act as a block of macrocells on an ESB-by-ESB basis. Each ESB is fed by 32 inputs from the adjacent local interconnect; therefore, it can be driven by the MegaLAB interconnect or the adjacent LAB. Also, nine ESB macrocells feed back into the ESB through the local interconnect for higher performance. Dedicated clock pins, global signals, and additional inputs from the local interconnect drive the ESB control signals.

In product-term mode, each ESB contains 16 macrocells. Each macrocell consists of two product terms and a programmable register. Figure 13 shows the ESB in product-term mode.

**Figure 22. ESB in Single-Port Mode** *Note (1)***Notes to Figure 22:**

- (1) All registers can be asynchronously cleared by ESB local interconnect signals, global signals, or the chip-wide reset.
- (2) APEX 20KE devices have four dedicated clocks.

## Content-Addressable Memory

In APEX 20KE devices, the ESB can implement CAM. CAM can be thought of as the inverse of RAM. When read, RAM outputs the data for a given address. Conversely, CAM outputs an address for a given data word. For example, if the data FA12 is stored in address 14, the CAM outputs 14 when FA12 is driven into it.

CAM is used for high-speed search operations. When searching for data within a RAM block, the search is performed serially. Thus, finding a particular data word can take many cycles. CAM searches all addresses in parallel and outputs the address storing a particular word. When a match is found, a match flag is set high. [Figure 23](#) shows the CAM block diagram.

**Figure 23. APEX 20KE CAM Block Diagram**

CAM can be used in any application requiring high-speed searches, such as networking, communications, data compression, and cache management.

The APEX 20KE on-chip CAM provides faster system performance than traditional discrete CAM. Integrating CAM and logic into the APEX 20KE device eliminates off-chip and on-chip delays, improving system performance.

When in CAM mode, the ESB implements 32-word, 32-bit CAM. Wider or deeper CAM can be implemented by combining multiple CAMs with some ancillary logic implemented in LEs. The Quartus II software combines ESBs and LEs automatically to create larger CAMs.

CAM supports writing “don’t care” bits into words of the memory. The “don’t-care” bit can be used as a mask for CAM comparisons; any bit set to “don’t-care” has no effect on matches.

The output of the CAM can be encoded or unencoded. When encoded, the ESB outputs an encoded address of the data’s location. For instance, if the data is located in address 12, the ESB output is 12. When unencoded, the ESB uses its 16 outputs to show the location of the data over two clock cycles. In this case, if the data is located in address 12, the 12th output line goes high. When using unencoded outputs, two clock cycles are required to read the output because a 16-bit output bus is used to show the status of 32 words.

The encoded output is better suited for designs that ensure duplicate data is not written into the CAM. If duplicate data is written into two locations, the CAM’s output will be incorrect. If the CAM may contain duplicate data, the unencoded output is a better solution; CAM with unencoded outputs can distinguish multiple data locations.

CAM can be pre-loaded with data during configuration, or it can be written during system operation. In most cases, two clock cycles are required to write each word into CAM. When “don’t-care” bits are used, a third clock cycle is required.

## Implementing Logic in ROM

In addition to implementing logic with product terms, the ESB can implement logic functions when it is programmed with a read-only pattern during configuration, creating a large LUT. With LUTs, combinatorial functions are implemented by looking up the results, rather than by computing them. This implementation of combinatorial functions can be faster than using algorithms implemented in general logic, a performance advantage that is further enhanced by the fast access times of ESBs. The large capacity of ESBs enables designers to implement complex functions in one logic level without the routing delays associated with linked LEs or distributed RAM blocks. Parameterized functions such as LPM functions can take advantage of the ESB automatically. Further, the Quartus II software can implement portions of a design with ESBs where appropriate.

## Programmable Speed/Power Control

APEX 20K ESBs offer a high-speed mode that supports very fast operation on an ESB-by-ESB basis. When high speed is not required, this feature can be turned off to reduce the ESB's power dissipation by up to 50%. ESBs that run at low power incur a nominal timing delay adder. This Turbo Bit™ option is available for ESBs that implement product-term logic or memory functions. An ESB that is not used will be powered down so that it does not consume DC current.

Designers can program each ESB in the APEX 20K device for either high-speed or low-power operation. As a result, speed-critical paths in the design can run at high speed, while the remaining paths operate at reduced power.

## I/O Structure

The APEX 20K IOE contains a bidirectional I/O buffer and a register that can be used either as an input register for external data requiring fast setup times, or as an output register for data requiring fast clock-to-output performance. IOEs can be used as input, output, or bidirectional pins. For fast bidirectional I/O timing, LE registers using local routing can improve setup times and OE timing. The Quartus II software Compiler uses the programmable inversion option to invert signals from the row and column interconnect automatically where appropriate. Because the APEX 20K IOE offers one output enable per pin, the Quartus II software Compiler can emulate open-drain operation efficiently.

The APEX 20K IOE includes programmable delays that can be activated to ensure zero hold times, minimum clock-to-output times, input IOE register-to-core register transfers, or core-to-output IOE register transfers. A path in which a pin directly drives a register may require the delay to ensure zero hold time, whereas a path in which a pin drives a register through combinatorial logic may not require the delay.

**Figure 29. APEX 20KE I/O Banks**

**Notes to Figure 29:**

- (1) For more information on placing I/O pins in LVDS blocks, refer to the *Guidelines for Using LVDS Blocks* section in *Application Note 120 (Using LVDS in APEX 20KE Devices)*.
- (2) If the LVDS input and output blocks are not used for LVDS, they can support all of the I/O standards and can be used as input, output, or bidirectional pins with  $V_{CCIO}$  set to 3.3 V, 2.5 V, or 1.8 V.

## Power Sequencing & Hot Socketing

Because APEX 20K and APEX 20KE devices can be used in a mixed-voltage environment, they have been designed specifically to tolerate any possible power-up sequence. Therefore, the  $V_{CCIO}$  and  $V_{CCINT}$  power supplies may be powered in any order.

For more information, please refer to the "Power Sequencing Considerations" section in the *Configuring APEX 20KE & APEX 20KC Devices* chapter of the *Configuration Devices Handbook*.

Signals can be driven into APEX 20K devices before and during power-up without damaging the device. In addition, APEX 20K devices do not drive out during power-up. Once operating conditions are reached and the device is configured, APEX 20K and APEX 20KE devices operate as specified by the user.

The APEX 20K device instruction register length is 10 bits. The APEX 20K device USERCODE register length is 32 bits. [Tables 20 and 21](#) show the boundary-scan register length and device IDCODE information for APEX 20K devices.

**Table 20. APEX 20K Boundary-Scan Register Length**

Device	Boundary-Scan Register Length

Figure 35 shows the output drive characteristics of APEX 20KE devices.

**Figure 35. Output Drive Characteristics of APEX 20KE Devices** *Note (1)*

**Note to Figure 35:**

(1) These are transient (AC) currents.

## Timing Model

The high-performance FastTrack and MegaLAB interconnect routing resources ensure predictable performance, accurate simulation, and accurate timing analysis. This predictable performance contrasts with that of FPGAs, which use a segmented connection scheme and therefore have unpredictable performance.

Figures 38 and 39 show the asynchronous and synchronous timing waveforms, respectively, for the ESB macroparameters in Table 31.
