Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	640
Number of Logic Elements/Cells	6400
Total RAM Bits	81920
Number of I/O	143
Number of Gates	404000
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)

Product-Term Logic

The product-term portion of the MultiCore architecture is implemented with the ESB. The ESB can be configured to act as a block of macrocells on an ESB-by-ESB basis. Each ESB is fed by 32 inputs from the adjacent local interconnect; therefore, it can be driven by the MegaLAB interconnect or the adjacent LAB. Also, nine ESB macrocells feed back into the ESB through the local interconnect for higher performance. Dedicated clock pins, global signals, and additional inputs from the local interconnect drive the ESB control signals.

In product-term mode, each ESB contains 16 macrocells. Each macrocell consists of two product terms and a programmable register. Figure 13 shows the ESB in product-term mode.

Table 10 describes the APEX 20K programmable delays and their logic options in the Quartus II software.

Table 10. APEX 20K Programmable Delay Chains	
Programmable Delays	Quartus II Logic Option
Input pin to core delay	Decrease input delay to internal cells
Input pin to input register delay	Decrease input delay to input register
Core to output register delay	Decrease input delay to output register
Output register t_{CO} delay	Increase delay to output pin

The Quartus II software compiler can program these delays automatically to minimize setup time while providing a zero hold time. Figure 25 shows how fast bidirectional I/Os are implemented in APEX 20K devices.

The register in the APEX 20K IOE can be programmed to power-up high or low after configuration is complete. If it is programmed to power-up low, an asynchronous clear can control the register. If it is programmed to power-up high, the register cannot be asynchronously cleared or preset. This feature is useful for cases where the APEX 20K device controls an active-low input or another device; it prevents inadvertent activation of the input upon power-up.

Notes to Tables 17 and 18:

- (1) All input clock specifications must be met. The PLL may not lock onto an incoming clock if the clock specifications are not met, creating an erroneous clock within the device.
- (2) The maximum lock time is 40 μ s or 2000 input clock cycles, whichever occurs first.
- (3) Before configuration, the PLL circuits are disable and powered down. During configuration, the PLLs are still disabled. The PLLs begin to lock once the device is in the user mode. If the clock enable feature is used, lock begins once the CLKLK_ENA pin goes high in user mode.
- (4) The PLL VCO operating range is 200 MHz δ f_{VCO} δ 840 MHz for LVDS mode.

SignalTap Embedded Logic Analyzer

APEX 20K devices include device enhancements to support the SignalTap embedded logic analyzer. By including this circuitry, the APEX 20K device provides the ability to monitor design operation over a period of time through the IEEE Std. 1149.1 (JTAG) circuitry; a designer can analyze internal logic at speed without bringing internal signals to the I/O pins. This feature is particularly important for advanced packages such as FineLine BGA packages because adding a connection to a pin during the debugging process can be difficult after a board is designed and manufactured.

(2) The IDCODE's least significant bit (LSB) is always 1.

Figure 31 shows the timing requirements for the JTAG signals.

Figure 31. APEX 20K JTAG Waveforms

Figure 32. APEX 20K AC Test Conditions *Note (1)*

Note to Figure 32:

- (1) Power supply transients can affect AC measurements. Simultaneous transitions of multiple outputs should be avoided for accurate measurement. Threshold tests must not be performed under AC conditions. Large-amplitude, fast-ground-current transients normally occur as the device outputs discharge the load capacitances. When these transients flow through the parasitic inductance between the device ground pin and the test system ground, significant reductions in observable noise immunity can result.

Power Consumption

To estimate device power consumption, use the interactive power calculator on the Altera web site at <http://www.altera.com>.

Configuration & Operation

The APEX 20K architecture supports several configuration schemes. This section summarizes the device operating modes and available device configuration schemes.

Operating Modes

The APEX architecture uses SRAM configuration elements that require configuration data to be loaded each time the circuit powers up. The process of physically loading the SRAM data into the device is called configuration. During initialization, which occurs immediately after configuration, the device resets registers, enables I/O pins, and begins to operate as a logic device. The I/O pins are tri-stated during power-up, and before and during configuration. Together, the configuration and initialization processes are called *command mode*; normal device operation is called *user mode*.

Before and during device configuration, all I/O pins are pulled to V_{CCIO} by a built-in weak pull-up resistor.

SRAM configuration elements allow APEX 20K devices to be reconfigured in-circuit by loading new configuration data into the device. Real-time reconfiguration is performed by forcing the device into command mode with a device pin, loading different configuration data, reinitializing the device, and resuming user-mode operation. In-field upgrades can be performed by distributing new configuration files.

Configuration Schemes

The configuration data for an APEX 20K device can be loaded with one of five configuration schemes (see Table 111), chosen on the basis of the target application. An EPC2 or EPC16 configuration device, intelligent controller, or the JTAG port can be used to control the configuration of an APEX 20K device. When a configuration device is used, the system can configure automatically at system power-up.

Multiple APEX 20K devices can be configured in any of five configuration schemes by connecting the configuration enable (nCE) and configuration enable output (nCEO) pins on each device.

Table 111. Data Sources for Configuration	
Configuration Scheme	Data Source
Configuration device	EPC1, EPC2, EPC16 configuration devices
Passive serial (PS)	MasterBlaster or ByteBlasterMV download cable or serial data source
Passive parallel asynchronous (PPA)	Parallel data source
Passive parallel synchronous (PPS)	Parallel data source
JTAG	MasterBlaster or ByteBlasterMV download cable or a microprocessor with a Jam or JBC File

Revision History

The information contained in the *APEX 20K Programmable Logic Device Family Data Sheet* version 5.1 supersedes information published in previous versions.

Version 5.1

APEX 20K Programmable Logic Device Family Data Sheet version 5.1 contains the following changes:

- In version 5.0, the VI input voltage spec was updated in Table 28 on page 63.
- In version 5.0, *Note (5)* to Tables 27 through 30 was revised.
- Added *Note (2)* to Figure 21 on page 33.

Version 5.0

APEX 20K Programmable Logic Device Family Data Sheet version 5.0 contains the following changes:

- Updated Tables 23 through 26. Removed 2.5-V operating condition tables because all APEX 20K devices are now 5.0-V tolerant.
- Updated conditions in Tables 33, 38 and 39.
- Updated data for $t_{\text{ESB DATAH}}$ parameter.

Version 4.3

APEX 20K Programmable Logic Device Family Data Sheet version 4.3 contains the following changes:

- Updated Figure 20.
- Updated *Note (2)* to Table 13.
- Updated notes to Tables 27 through 30.

Version 4.2

APEX 20K Programmable Logic Device Family Data Sheet version 4.2 contains the following changes:

- Updated Figure 29.
- Updated *Note (1)* to Figure 29.
