Altera - EP20K200RC208-3 Datasheet

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	832
Number of Logic Elements/Cells	8320
Total RAM Bits	106496
Number of I/O	144
Number of Gates	526000
Voltage - Supply	2.375V ~ 2.625V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	208-BFQFP Exposed Pad
Supplier Device Package	208-RQFP (28x28)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=ep20k200rc208-3

Table 2. Additional APEX 20K Device Features *Note (1)*

Feature	EP20K300E	EP20K400	EP20K400E	EP20K600E	EP20K1000E	EP20K1500E
Maximum system gates	728,000	1,052,000	1,052,000	1,537,000	1,772,000	2,392,000
Typical gates	300,000	400,000	400,000	600,000	1,000,000	1,500,000
LEs	11,520	16,640	16,640	24,320	38,400	51,840
ESBs	72	104	104	152	160	216
Maximum RAM bits	147,456	212,992	212,992	311,296	327,680	442,368
Maximum macrocells	1,152	1,664	1,664	2,432	2,560	3,456
Maximum user I/O pins	408	502	488	588	708	808

Note to Tables 1 and 2:

(1) The embedded IEEE Std. 1149.1 Joint Test Action Group (JTAG) boundary-scan circuitry contributes up to 57,000 additional gates.

Additional Features

- Designed for low-power operation
  - 1.8-V and 2.5-V supply voltage (see Table 3)
  - MultiVolt™ I/O interface support to interface with 1.8-V, 2.5-V, 3.3-V, and 5.0-V devices (see Table 3)
  - ESB offering programmable power-saving mode

Table 3. APEX 20K Supply Voltages

Feature	Device	
	EP20K100 EP20K200 EP20K400	EP20K30E EP20K60E EP20K100E EP20K160E EP20K200E EP20K300E EP20K400E EP20K600E EP20K1000E EP20K1500E
Internal supply voltage (V_{CCINT})	2.5 V	1.8 V
MultiVolt I/O interface voltage levels (V_{CCIO})	2.5 V, 3.3 V, 5.0 V	1.8 V, 2.5 V, 3.3 V, 5.0 V *(1)*

Note to Table 3:

(1) APEX 20KE devices can be 5.0-V tolerant by using an external resistor.

Windows-based PCs, Sun SPARCstations, and HP 9000 Series 700/800 workstations
- Altera MegaCore® functions and Altera Megafunction Partners Program (AMPP℠) megafunctions
- NativeLink™ integration with popular synthesis, simulation, and timing analysis tools
- Quartus II SignalTap® embedded logic analyzer simplifies in-system design evaluation by giving access to internal nodes during device operation
- Supports popular revision-control software packages including PVCS, Revision Control System (RCS), and Source Code Control System (SCCS)

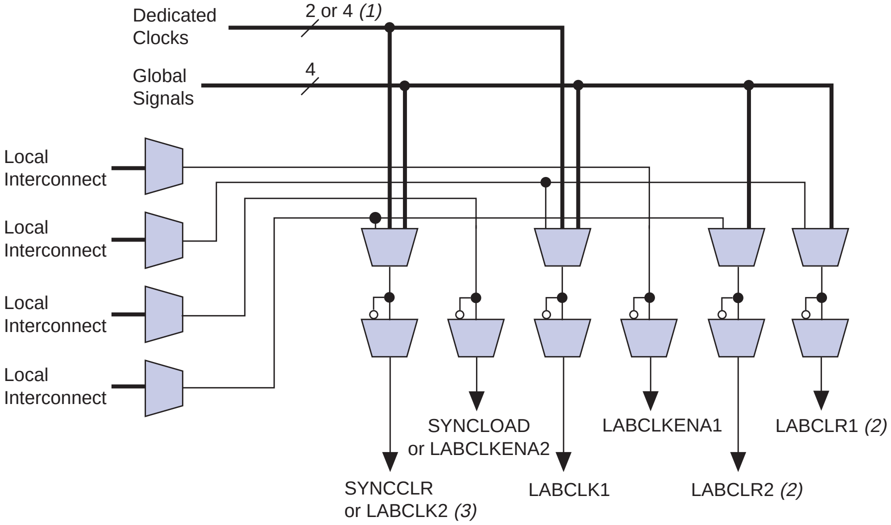
Each LAB contains dedicated logic for driving control signals to its LEs and ESBs. The control signals include clock, clock enable, asynchronous clear, asynchronous preset, asynchronous load, synchronous clear, and synchronous load signals. A maximum of six control signals can be used at a time. Although synchronous load and clear signals are generally used when implementing counters, they can also be used with other functions.

Each LAB can use two clocks and two clock enable signals. Each LAB's clock and clock enable signals are linked (e.g., any LE in a particular LAB using `CLK1` will also use `CLKENA1`). LEs with the same clock but different clock enable signals either use both clock signals in one LAB or are placed into separate LABs.

If both the rising and falling edges of a clock are used in a LAB, both LAB-wide clock signals are used.

The LAB-wide control signals can be generated from the LAB local interconnect, global signals, and dedicated clock pins. The inherent low skew of the FastTrack Interconnect enables it to be used for clock distribution. Figure 4 shows the LAB control signal generation circuit.

Figure 4. LAB Control Signal Generation



Notes to Figure 4:

(1) APEX 20KE devices have four dedicated clocks.
(2) The `LABCLR1` and `LABCLR2` signals also control asynchronous load and asynchronous preset for LEs within the LAB.
(3) The `SYNCCLR` signal can be generated by the local interconnect or global signals.

Each LE has two outputs that drive the local, MegaLAB, or FastTrack Interconnect routing structure. Each output can be driven independently by the LUT's or register's output. For example, the LUT can drive one output while the register drives the other output. This feature, called register packing, improves device utilization because the register and the LUT can be used for unrelated functions. The LE can also drive out registered and unregistered versions of the LUT output.

The APEX 20K architecture provides two types of dedicated high-speed data paths that connect adjacent LEs without using local interconnect paths: carry chains and cascade chains. A carry chain supports high-speed arithmetic functions such as counters and adders, while a cascade chain implements wide-input functions such as equality comparators with minimum delay. Carry and cascade chains connect LEs 1 through 10 in an LAB and all LABs in the same MegaLAB structure.

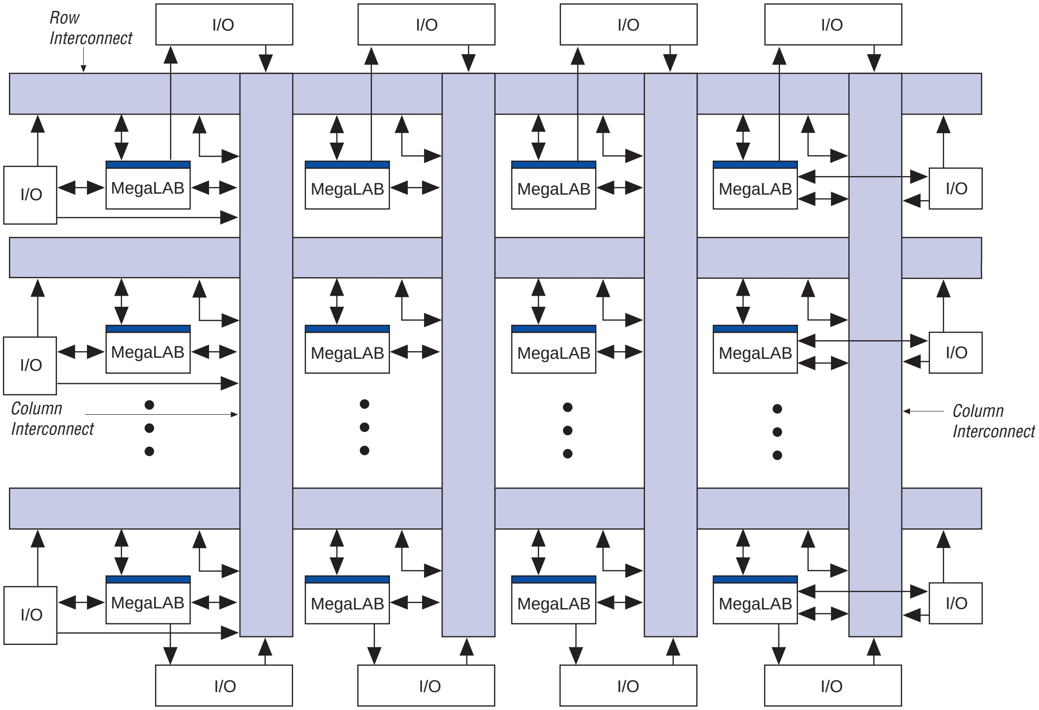
Carry Chain

The carry chain provides a very fast carry-forward function between LEs. The carry-in signal from a lower-order bit drives forward into the higher-order bit via the carry chain, and feeds into both the LUT and the next portion of the carry chain. This feature allows the APEX 20K architecture to implement high-speed counters, adders, and comparators of arbitrary width. Carry chain logic can be created automatically by the Quartus II software Compiler during design processing, or manually by the designer during design entry. Parameterized functions such as library of parameterized modules (LPM) and DesignWare functions automatically take advantage of carry chains for the appropriate functions.

The Quartus II software Compiler creates carry chains longer than ten LEs by linking LABs together automatically. For enhanced fitting, a long carry chain skips alternate LABs in a MegaLAB™ structure. A carry chain longer than one LAB skips either from an even-numbered LAB to the next even-numbered LAB, or from an odd-numbered LAB to the next odd-numbered LAB. For example, the last LE of the first LAB in the upper-left MegaLAB structure carries to the first LE of the third LAB in the MegaLAB structure.

Figure 6 shows how an n-bit full adder can be implemented in $n + 1$ LEs with the carry chain. One portion of the LUT generates the sum of two bits using the input signals and the carry-in signal; the sum is routed to the output of the LE. The register can be bypassed for simple adders or used for accumulator functions. Another portion of the LUT and the carry chain logic generates the carry-out signal, which is routed directly to the carry-in signal of the next-higher-order bit. The final carry-out signal is routed to an LE, where it is driven onto the local, MegaLAB, or FastTrack Interconnect routing structures.

Figure 9. APEX 20K Interconnect Structure



A row line can be driven directly by LEs, IOEs, or ESBs in that row. Further, a column line can drive a row line, allowing an LE, IOE, or ESB to drive elements in a different row via the column and row interconnect. The row interconnect drives the MegaLAB interconnect to drive LEs, IOEs, or ESBs in a particular MegaLAB structure.

A column line can be directly driven by LEs, IOEs, or ESBs in that column. A column line on a device's left or right edge can also be driven by row IOEs. The column line is used to route signals from one row to another. A column line can drive a row line; it can also drive the MegaLAB interconnect directly, allowing faster connections between rows.

Figure 10 shows how the FastTrack Interconnect uses the local interconnect to drive LEs within MegaLAB structures.

Figure 10. FastTrack Connection to Local Interconnect

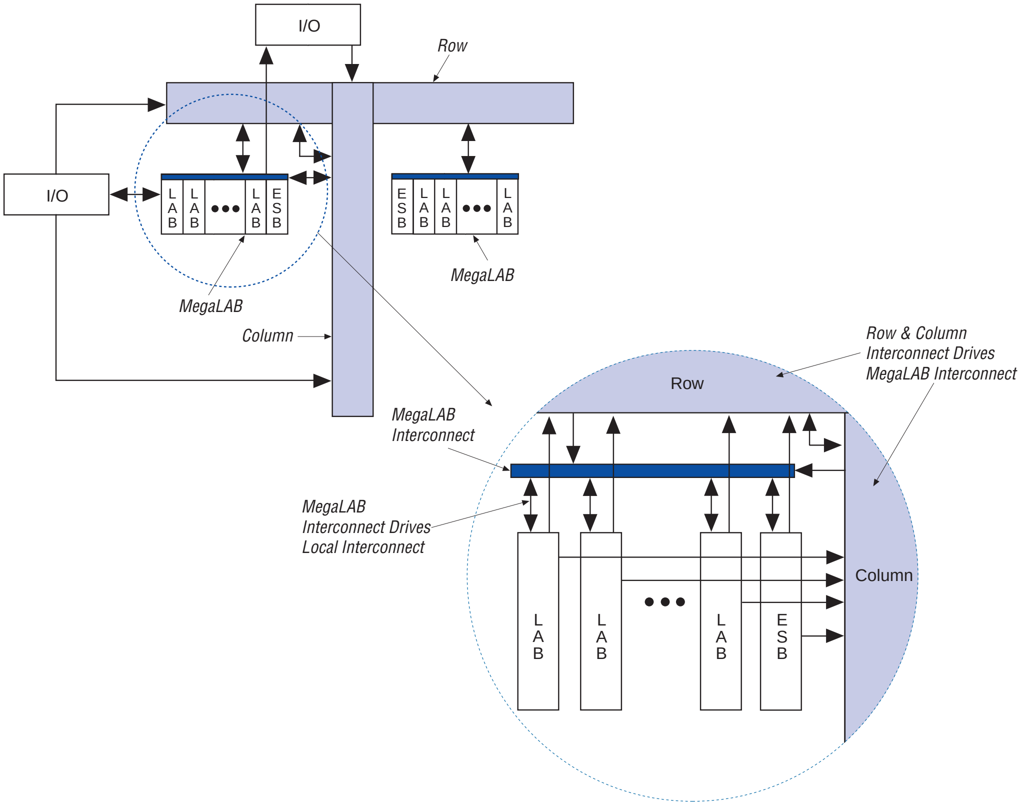


Figure 13. Product-Term Logic in ESB

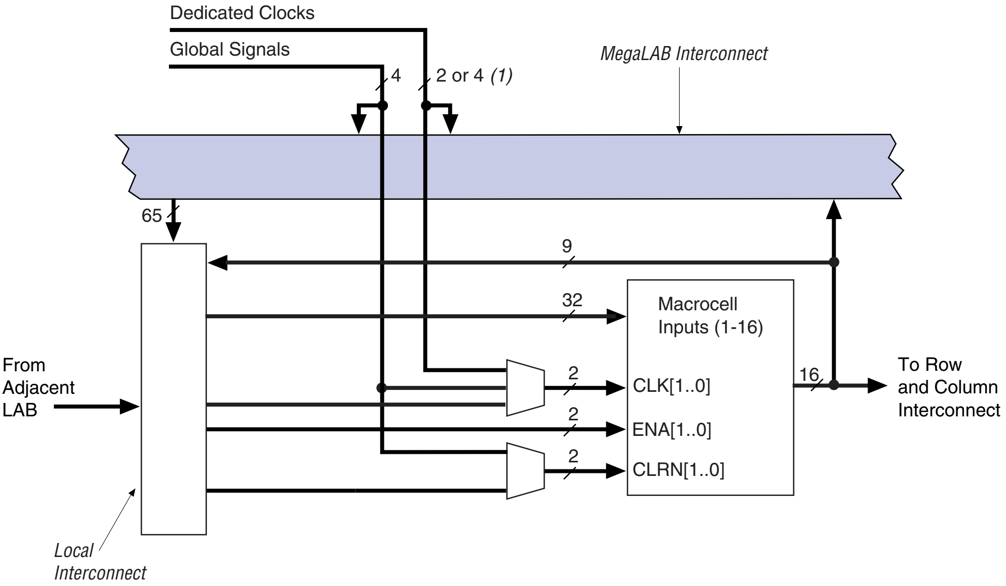


Note to Figure 13:

(1) APEX 20KE devices have four dedicated clocks.

Macrocells

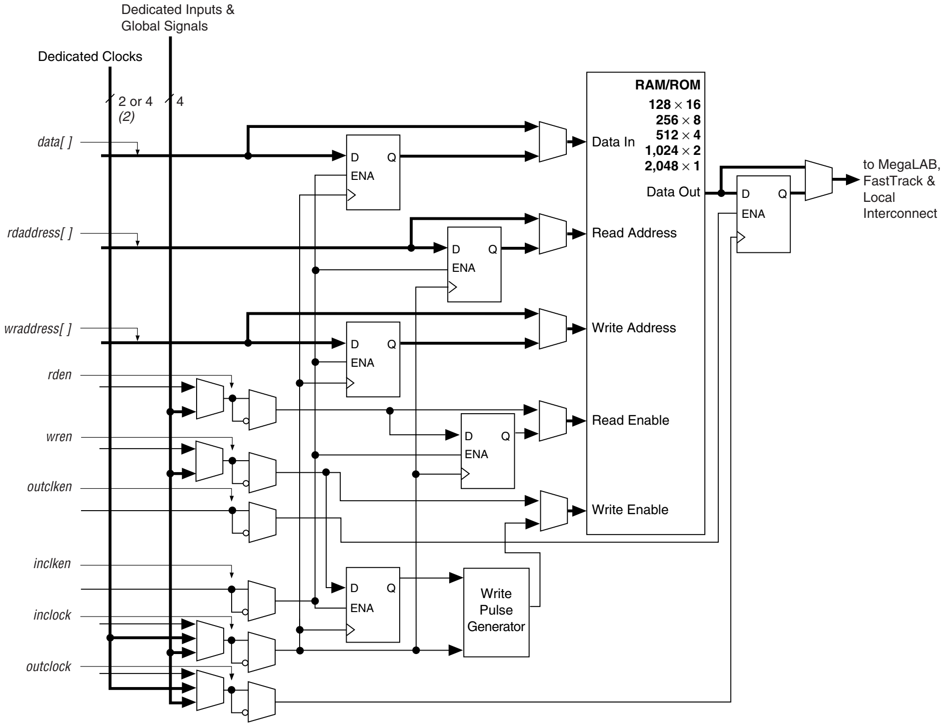
APEX 20K macrocells can be configured individually for either sequential or combinatorial logic operation. The macrocell consists of three functional blocks: the logic array, the product-term select matrix, and the programmable register.

Combinatorial logic is implemented in the product terms. The product-term select matrix allocates these product terms for use as either primary logic inputs (to the `OR` and `XOR` gates) to implement combinatorial functions, or as parallel expanders to be used to increase the logic available to another macrocell. One product term can be inverted; the Quartus II software uses this feature to perform DeMorgan's inversion for more efficient implementation of wide `OR` functions. The Quartus II software Compiler can use a `NOT`-gate push-back technique to emulate an asynchronous preset. Figure 14 shows the APEX 20K macrocell.

Input/Output Clock Mode

The input/output clock mode contains two clocks. One clock controls all registers for inputs into the ESB: data input, `WE`, `RE`, read address, and write address. The other clock controls the ESB data output registers. The ESB also supports clock enable and asynchronous clear signals; these signals also control the reading and writing of registers independently. Input/output clock mode is commonly used for applications where the reads and writes occur at the same system frequency, but require different clock enable signals for the input and output registers. Figure 21 shows the ESB in input/output clock mode.

Figure 21. ESB in Input/Output Clock Mode *Note (1)*



Notes to Figure 21:

(1) All registers can be cleared asynchronously by ESB local interconnect signals, global signals, or the chip-wide reset.

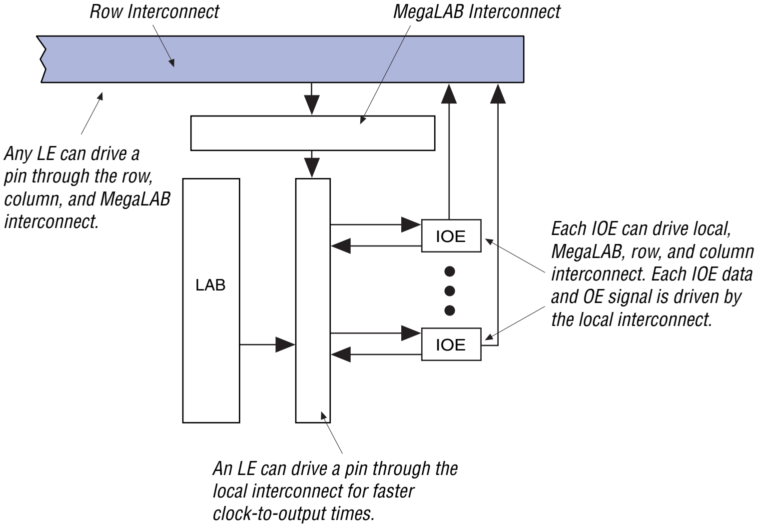
(2) APEX 20KE devices have four dedicated clocks.

Single-Port Mode

The APEX 20K ESB also supports a single-port mode, which is used when simultaneous reads and writes are not required. See Figure 22.

Each IOE drives a row, column, MegaLAB, or local interconnect when used as an input or bidirectional pin. A row IOE can drive a local, MegaLAB, row, and column interconnect; a column IOE can drive the column interconnect. Figure 27 shows how a row IOE connects to the interconnect.

Figure 27. Row IOE Connection to the Interconnect



Advanced I/O Standard Support

APEX 20KE IOEs support the following I/O standards: LVTTL, LVCMOS, 1.8-V I/O, 2.5-V I/O, 3.3-V PCI, PCI-X, 3.3-V AGP, LVDS, LVPECL, GTL+, CTT, HSTL Class I, SSTL-3 Class I and II, and SSTL-2 Class I and II.

For more information on I/O standards supported by APEX 20KE devices, see *Application Note 117 (Using Selectable I/O Standards in Altera Devices)*.

The APEX 20KE device contains eight I/O banks. In QFP packages, the banks are linked to form four I/O banks. The I/O banks directly support all standards except LVDS and LVPECL. All I/O banks can support LVDS and LVPECL with the addition of external resistors. In addition, one block within a bank contains circuitry to support high-speed True-LVDS and LVPECL inputs, and another block within a particular bank supports high-speed True-LVDS and LVPECL outputs. The LVDS blocks support all of the I/O standards. Each I/O bank has its own `VCCIO` pins. A single device can support 1.8-V, 2.5-V, and 3.3-V interfaces; each bank can support a different standard independently. Each bank can also use a separate V_{REF} level so that each bank can support any of the terminated standards (such as SSTL-3) independently. Within a bank, any one of the terminated standards can be supported. EP20K300E and larger APEX 20KE devices support the LVDS interface for data pins (smaller devices support LVDS clock pins, but not data pins). All EP20K300E and larger devices support the LVDS interface for data pins up to 155 Mbit per channel; EP20K400E devices and larger with an X-suffix on the ordering code add a serializer/deserializer circuit and PLL for higher-speed support.

Each bank can support multiple standards with the same `VCCIO` for output pins. Each bank can support one voltage-referenced I/O standard, but it can support multiple I/O standards with the same `VCCIO` voltage level. For example, when `VCCIO` is 3.3 V, a bank can support LVTTL, LVCMOS, 3.3-V PCI, and SSTL-3 for inputs and outputs.

When the LVDS banks are not used as LVDS I/O banks, they support all of the other I/O standards. Figure 29 shows the arrangement of the APEX 20KE I/O banks.

Under hot socketing conditions, APEX 20KE devices will not sustain any damage, but the I/O pins will drive out.

MultiVolt I/O Interface

The APEX device architecture supports the MultiVolt I/O interface feature, which allows APEX devices in all packages to interface with systems of different supply voltages. The devices have one set of `VCC` pins for internal operation and input buffers (`VCCINT`), and another set for I/O output drivers (`VCCIO`).

The APEX 20K `VCCINT` pins must always be connected to a 2.5 V power supply. With a 2.5-V V_{CCINT} level, input pins are 2.5-V, 3.3-V, and 5.0-V tolerant. The `VCCIO` pins can be connected to either a 2.5-V or 3.3-V power supply, depending on the output requirements. When `VCCIO` pins are connected to a 2.5-V power supply, the output levels are compatible with 2.5-V systems. When the `VCCIO` pins are connected to a 3.3-V power supply, the output high is 3.3 V and is compatible with 3.3-V or 5.0-V systems.

Table 12 summarizes 5.0-V tolerant APEX 20K MultiVolt I/O support.

Table 12. 5.0-V Tolerant APEX 20K MultiVolt I/O Support

V_{CCIO} (V)	Input Signals (V)			Output Signals (V)		
	2.5	3.3	5.0	2.5	3.3	5.0
2.5	✓	✓ (1)	✓ (1)	✓		
3.3	✓	✓	✓ (1)	✓ (2)	✓	✓

Notes to Table 12:

(1) The PCI clamping diode must be disabled to drive an input with voltages higher than V_{CCIO}.

(2) When V_{CCIO} = 3.3 V, an APEX 20K device can drive a 2.5-V device with 3.3-V tolerant inputs.

Open-drain output pins on 5.0-V tolerant APEX 20K devices (with a pull-up resistor to the 5.0-V supply) can drive 5.0-V CMOS input pins that require a V_{IH} of 3.5 V. When the pin is inactive, the trace will be pulled up to 5.0 V by the resistor. The open-drain pin will only drive low or tri-state; it will never drive high. The rise time is dependent on the value of the pull-up resistor and load impedance. The I_{OL} current specification should be considered when selecting a pull-up resistor.

For designs that require both a multiplied and non-multiplied clock, the clock trace on the board can be connected to `CLK2p`. Table 14 shows the combinations supported by the ClockLock and ClockBoost circuitry. The `CLK2p` pin can feed both the ClockLock and ClockBoost circuitry in the APEX 20K device. However, when both circuits are used, the other clock pin (`CLK1p`) cannot be used.

Table 14. Multiplication Factor Combinations

Clock 1	Clock 2
×1	×1
×1, ×2	×2
×1, ×2, ×4	×4

APEX 20KE ClockLock Feature

APEX 20KE devices include an enhanced ClockLock feature set. These devices include up to four PLLs, which can be used independently. Two PLLs are designed for either general-purpose use or LVDS use (on devices that support LVDS I/O pins). The remaining two PLLs are designed for general-purpose use. The EP20K200E and smaller devices have two PLLs; the EP20K300E and larger devices have four PLLs.

The following sections describe some of the features offered by the APEX 20KE PLLs.

External PLL Feedback

The ClockLock circuit's output can be driven off-chip to clock other devices in the system; further, the feedback loop of the PLL can be routed off-chip. This feature allows the designer to exercise fine control over the I/O interface between the APEX 20KE device and another high-speed device, such as SDRAM.

Clock Multiplication

The APEX 20KE ClockBoost circuit can multiply or divide clocks by a programmable number. The clock can be multiplied by $m/(n \times k)$ or $m/(n \times v)$, where m and k range from 2 to 160, and n and v range from 1 to 16. Clock multiplication and division can be used for time-domain multiplexing and other functions, which can reduce design LE requirements.

Clock Phase & Delay Adjustment

The APEX 20KE ClockShift feature allows the clock phase and delay to be adjusted. The clock phase can be adjusted by 90° steps. The clock delay can be adjusted to increase or decrease the clock delay by an arbitrary amount, up to one clock period.

LVDS Support

Two PLLs are designed to support the LVDS interface. When using LVDS, the I/O clock runs at a slower rate than the data transfer rate. Thus, PLLs are used to multiply the I/O clock internally to capture the LVDS data. For example, an I/O clock may run at 105 MHz to support 840 megabits per second (Mbps) LVDS data transfer. In this example, the PLL multiplies the incoming clock by eight to support the high-speed data transfer. You can use PLLs in EP20K400E and larger devices for high-speed LVDS interfacing.

Lock Signals

The APEX 20KE ClockLock circuitry supports individual `LOCK` signals. The `LOCK` signal drives high when the ClockLock circuit has locked onto the input clock. The `LOCK` signals are optional for each ClockLock circuit; when not used, they are I/O pins.

ClockLock & ClockBoost Timing Parameters

For the ClockLock and ClockBoost circuitry to function properly, the incoming clock must meet certain requirements. If these specifications are not met, the circuitry may not lock onto the incoming clock, which generates an erroneous clock within the device. The clock generated by the ClockLock and ClockBoost circuitry must also meet certain specifications. If the incoming clock meets these requirements during configuration, the APEX 20K ClockLock and ClockBoost circuitry will lock onto the clock during configuration. The circuit will be ready for use immediately after configuration. In APEX 20KE devices, the clock input standard is programmable, so the PLL cannot respond to the clock until the device is configured. The PLL locks onto the input clock as soon as configuration is complete. Figure 30 shows the incoming and generated clock specifications.

☞ For more information on ClockLock and ClockBoost circuitry, see *Application Note 115: Using the ClockLock and ClockBoost PLL Features in APEX Devices*.

Table 28. APEX 20KE Device Recommended Operating Conditions

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CCINT}	Supply voltage for internal logic and input buffers	(3), (4)	1.71 (1.71)	1.89 (1.89)	V
V_{CCIO}	Supply voltage for output buffers, 3.3-V operation	(3), (4)	3.00 (3.00)	3.60 (3.60)	V
	Supply voltage for output buffers, 2.5-V operation	(3), (4)	2.375 (2.375)	2.625 (2.625)	V
	Supply voltage for output buffers, 1.8-V operation	(3), (4)	1.71 (1.71)	1.89 (1.89)	V
V_I	Input voltage	(5), (6)	–0.5	4.0	V
V_O	Output voltage		0	V_{CCIO}	V
T_J	Junction temperature	For commercial use	0	85	° C
		For industrial use	–40	100	° C
t_R	Input rise time			40	ns
t_F	Input fall time			40	ns

☞ For DC Operating Specifications on APEX 20KE I/O standards, please refer to *Application Note 117 (Using Selectable I/O Standards in Altera Devices).*

Table 30. APEX 20KE Device Capacitance *Note (15)*

Symbol	Parameter	Conditions	Min	Max	Unit
C_{IN}	Input capacitance	V_{IN} = 0 V, f = 1.0 MHz		8	pF
C_{INCLK}	Input capacitance on dedicated clock pin	V_{IN} = 0 V, f = 1.0 MHz		12	pF
C_{OUT}	Output capacitance	V_{OUT} = 0 V, f = 1.0 MHz		8	pF

Notes to Tables 27 through 30:

(1) See the *Operating Requirements for Altera Devices Data Sheet*.
(2) Minimum DC input is –0.5 V. During transitions, the inputs may undershoot to –2.0 V or overshoot to 5.75 V for input currents less than 100 mA and periods shorter than 20 ns.
(3) Numbers in parentheses are for industrial-temperature-range devices.
(4) Maximum V_{CC} rise time is 100 ms, and V_{CC} must rise monotonically.
(5) Minimum DC input is –0.5 V. During transitions, the inputs may undershoot to –2.0 V or overshoot to the voltage shown in the following table based on input duty cycle for input currents less than 100 mA. The overshoot is dependent upon duty cycle of the signal. The DC case is equivalent to 100% duty cycle.

Vin	Max. Duty Cycle
4.0V	100% (DC)
4.1	90%
4.2	50%
4.3	30%
4.4	17%
4.5	10%

(6) All pins, including dedicated inputs, clock, I/O, and JTAG pins, may be driven before V_{CCINT} and V_{CCIO} are powered.
(7) Typical values are for T_A = 25° C, V_{CCINT} = 1.8 V, and V_{CCIO} = 1.8 V, 2.5 V or 3.3 V.
(8) These values are specified under the APEX 20KE device recommended operating conditions, shown in Table 24 on page 60.
(9) Refer to *Application Note 117 (Using Selectable I/O Standards in Altera Devices)* for the V_{IH}, V_{IL}, V_{OH}, V_{OL}, and I_I parameters when VCCIO = 1.8 V.
(10) The APEX 20KE input buffers are compatible with 1.8-V, 2.5-V and 3.3-V (LVTTL and LVCMOS) signals. Additionally, the input buffers are 3.3-V PCI compliant. Input buffers also meet specifications for GTL+, CTT, AGP, SSTL-2, SSTL-3, and HSTL.
(11) The I_{OH} parameter refers to high-level TTL, PCI, or CMOS output current.
(12) The I_{OL} parameter refers to low-level TTL, PCI, or CMOS output current. This parameter applies to open-drain pins as well as output pins.
(13) This value is specified for normal device operation. The value may vary during power-up.
(14) Pin pull-up resistance values will be lower if an external source drives the pin higher than V_{CCIO}.
(15) Capacitance is sample-tested only.

Figure 33 shows the relationship between V_{CCIO} and V_{CCINT} for 3.3-V PCI compliance on APEX 20K devices.
