Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	2560
Number of Logic Elements/Cells	2560
Total RAM Bits	32768
Number of I/O	92
Number of Gates	162000
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=ep20k60etc144-1x

Table 5. APEX 20K FineLine BGA Package Options & I/O Count *Notes (1), (2)*

Device	144 Pin	324 Pin	484 Pin	672 Pin	1,020 Pin
EP20K30E	93	128			
EP20K60E	93	196			
EP20K100		252			
EP20K100E	93	246			
EP20K160E			316		
EP20K200			382		
EP20K200E			376	376	
EP20K300E				408	
EP20K400				502 *(3)*	
EP20K400E				488 *(3)*	
EP20K600E				508 *(3)*	588
EP20K1000E				508 *(3)*	708
EP20K1500E					808

Notes to Tables 4 and 5:

(1) I/O counts include dedicated input and clock pins.

(2) APEX 20K device package types include thin quad flat pack (TQFP), plastic quad flat pack (PQFP), power quad flat pack (RQFP), 1.27-mm pitch ball-grid array (BGA), 1.00-mm pitch FineLine BGA, and pin-grid array (PGA) packages.

(3) This device uses a thermally enhanced package, which is taller than the regular package. Consult the *Altera Device Package Information Data Sheet* for detailed package size information.

Table 6. APEX 20K QFP, BGA & PGA Package Sizes

Feature	144-Pin TQFP	208-Pin QFP	240-Pin QFP	356-Pin BGA	652-Pin BGA	655-Pin PGA
Pitch (mm)	0.50	0.50	0.50	1.27	1.27	–
Area (mm^2)	484	924	1,218	1,225	2,025	3,906
Length × Width (mm × mm)	22 × 22	30.4 × 30.4	34.9 × 34.9	35 × 35	45 × 45	62.5 × 62.5

Feature	144 Pin	324 Pin	484 Pin	672 Pin	1,020 Pin
Pitch (mm)	1.00	1.00	1.00	1.00	1.00
Area (mm^2)	169	361	529	729	1,089
Length × Width (mm × mm)	13 × 13	19 × 19	23 × 23	27 × 27	33 × 33

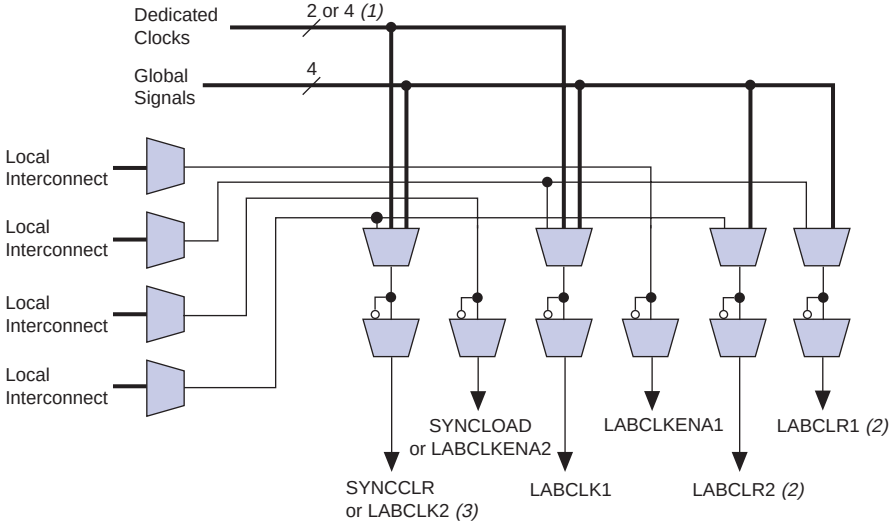
Each LAB contains dedicated logic for driving control signals to its LEs and ESBs. The control signals include clock, clock enable, asynchronous clear, asynchronous preset, asynchronous load, synchronous clear, and synchronous load signals. A maximum of six control signals can be used at a time. Although synchronous load and clear signals are generally used when implementing counters, they can also be used with other functions.

Each LAB can use two clocks and two clock enable signals. Each LAB's clock and clock enable signals are linked (e.g., any LE in a particular LAB using `CLK1` will also use `CLKENA1`). LEs with the same clock but different clock enable signals either use both clock signals in one LAB or are placed into separate LABs.

If both the rising and falling edges of a clock are used in a LAB, both LAB-wide clock signals are used.

The LAB-wide control signals can be generated from the LAB local interconnect, global signals, and dedicated clock pins. The inherent low skew of the FastTrack Interconnect enables it to be used for clock distribution. Figure 4 shows the LAB control signal generation circuit.

Figure 4. LAB Control Signal Generation



Notes to Figure 4:

(1) APEX 20KE devices have four dedicated clocks.

(2) The `LABCLR1` and `LABCLR2` signals also control asynchronous load and asynchronous preset for LEs within the LAB.

(3) The `SYNCCLR` signal can be generated by the local interconnect or global signals.

LE Operating Modes

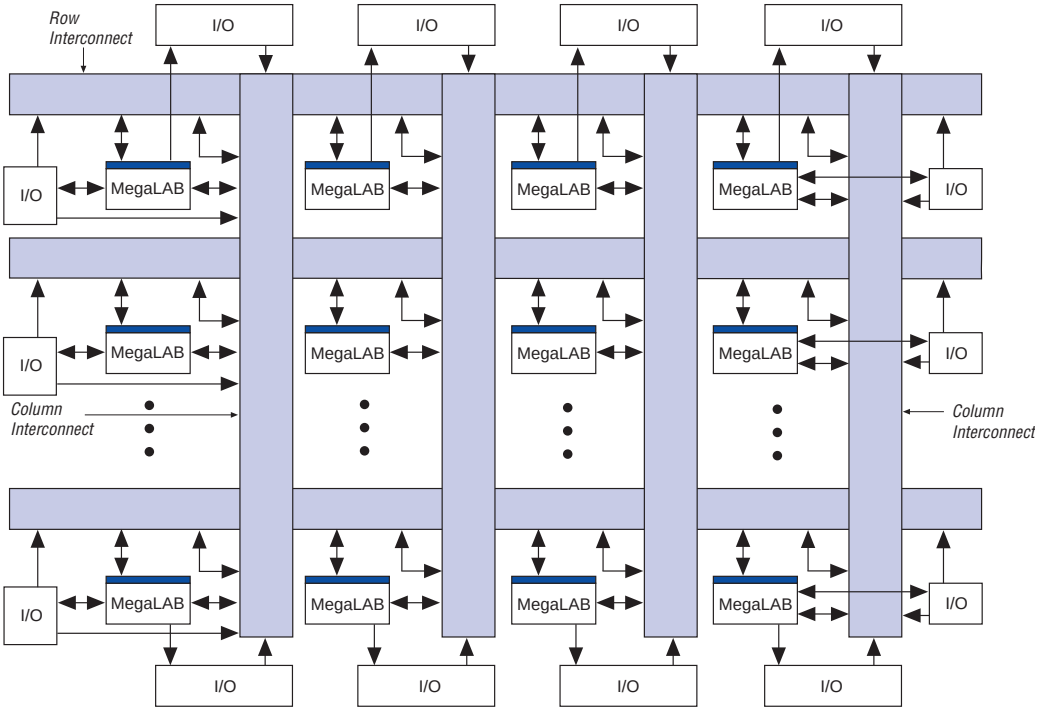
The APEX 20K LE can operate in one of the following three modes:

- Normal mode
- Arithmetic mode
- Counter mode

Each mode uses LE resources differently. In each mode, seven available inputs to the LE—the four data inputs from the LAB local interconnect, the feedback from the programmable register, and the carry-in and cascade-in from the previous LE—are directed to different destinations to implement the desired logic function. LAB-wide signals provide clock, asynchronous clear, asynchronous preset, asynchronous load, synchronous clear, synchronous load, and clock enable control for the register. These LAB-wide signals are available in all LE modes.

The Quartus II software, in conjunction with parameterized functions such as LPM and DesignWare functions, automatically chooses the appropriate mode for common functions such as counters, adders, and multipliers. If required, the designer can also create special-purpose functions that specify which LE operating mode to use for optimal performance. Figure 8 shows the LE operating modes.

Figure 9. APEX 20K Interconnect Structure

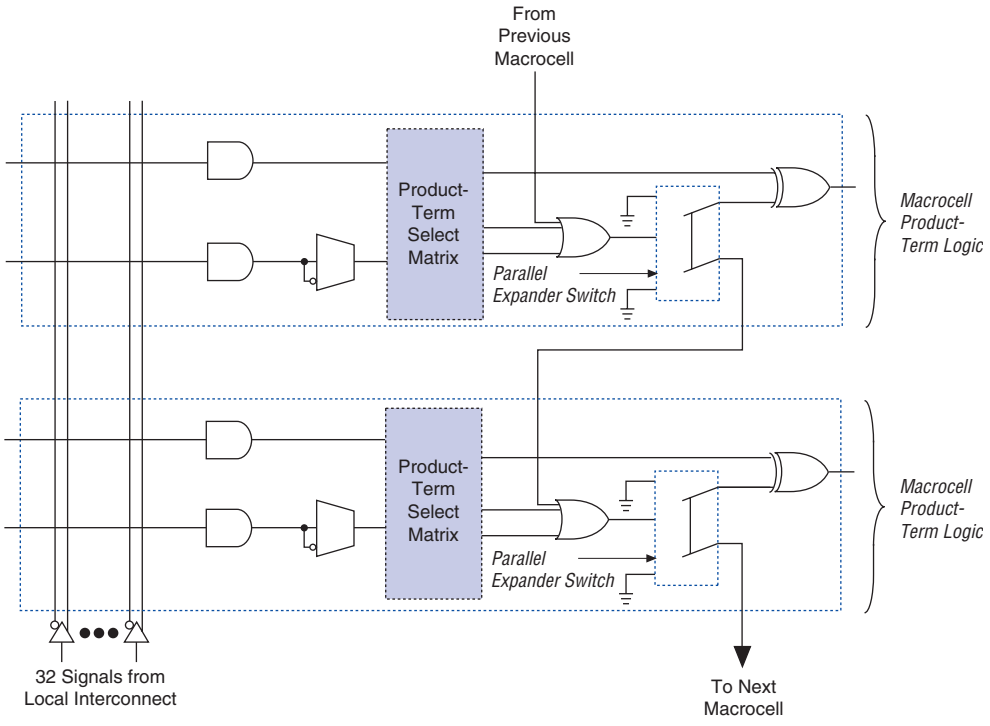


A row line can be driven directly by LEs, IOEs, or ESBs in that row. Further, a column line can drive a row line, allowing an LE, IOE, or ESB to drive elements in a different row via the column and row interconnect. The row interconnect drives the MegaLAB interconnect to drive LEs, IOEs, or ESBs in a particular MegaLAB structure.

A column line can be directly driven by LEs, IOEs, or ESBs in that column. A column line on a device's left or right edge can also be driven by row IOEs. The column line is used to route signals from one row to another. A column line can drive a row line; it can also drive the MegaLAB interconnect directly, allowing faster connections between rows.

Figure 10 shows how the FastTrack Interconnect uses the local interconnect to drive LEs within MegaLAB structures.

Figure 16. APEX 20K Parallel Expanders



Embedded System Block

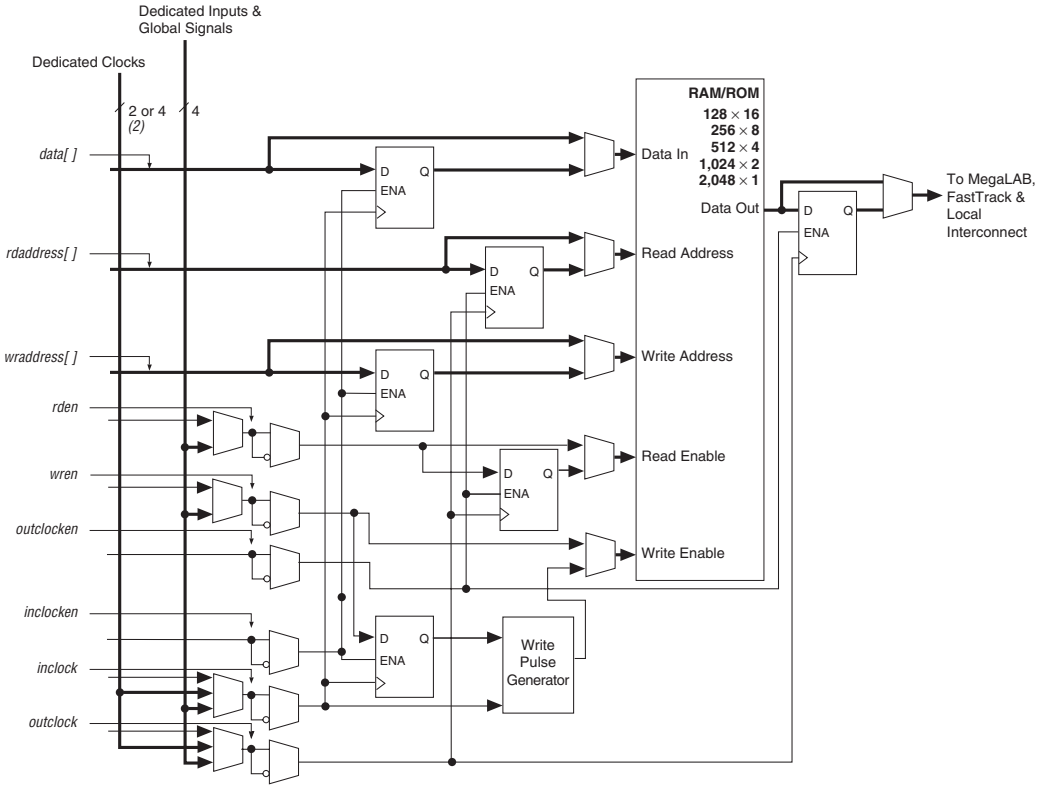
The ESB can implement various types of memory blocks, including dual-port RAM, ROM, FIFO, and CAM blocks. The ESB includes input and output registers; the input registers synchronize writes, and the output registers can pipeline designs to improve system performance. The ESB offers a dual-port mode, which supports simultaneous reads and writes at two different clock frequencies. Figure 17 shows the ESB block diagram.

Figure 17. ESB Block Diagram

Read/Write Clock Mode

The read/write clock mode contains two clocks. One clock controls all registers associated with writing: data input, WE, and write address. The other clock controls all registers associated with reading: read enable (RE), read address, and data output. The ESB also supports clock enable and asynchronous clear signals; these signals also control the read and write registers independently. Read/write clock mode is commonly used for applications where reads and writes occur at different system frequencies. Figure 20 shows the ESB in read/write clock mode.

Figure 20. ESB in Read/Write Clock Mode *Note (1)*



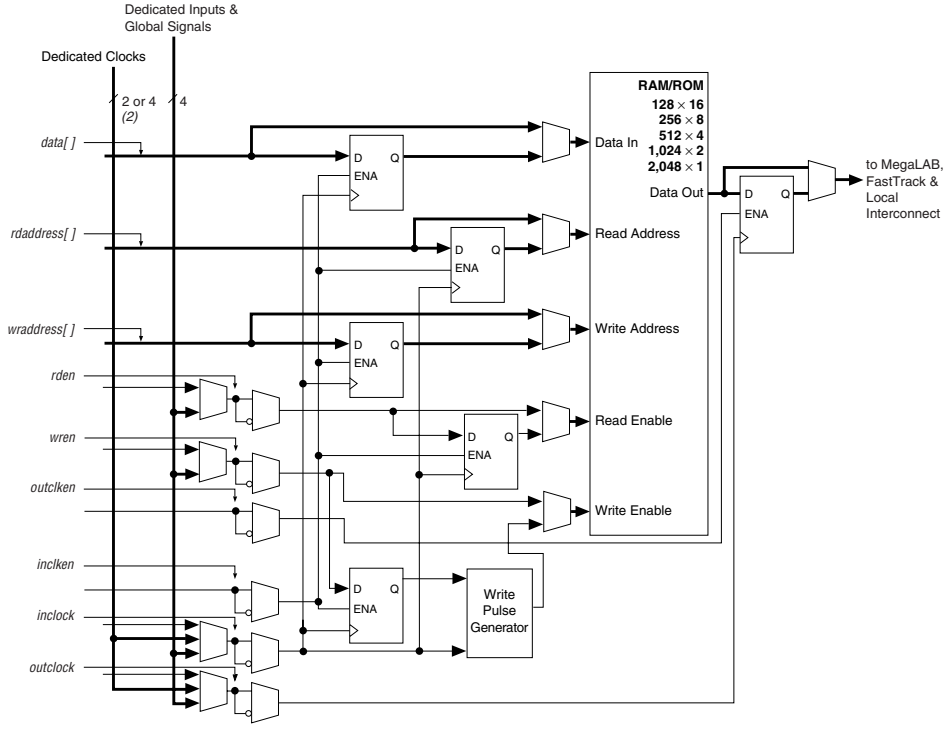
Notes to Figure 20:

(1) All registers can be cleared asynchronously by ESB local interconnect signals, global signals, or the chip-wide reset.
(2) APEX 20KE devices have four dedicated clocks.

Input/Output Clock Mode

The input/output clock mode contains two clocks. One clock controls all registers for inputs into the ESB: data input, WE, RE, read address, and write address. The other clock controls the ESB data output registers. The ESB also supports clock enable and asynchronous clear signals; these signals also control the reading and writing of registers independently. Input/output clock mode is commonly used for applications where the reads and writes occur at the same system frequency, but require different clock enable signals for the input and output registers. Figure 21 shows the ESB in input/output clock mode.

Figure 21. ESB in Input/Output Clock Mode *Note (1)*

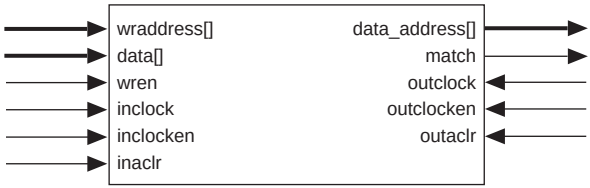


Notes to Figure 21:
(1) All registers can be cleared asynchronously by ESB local interconnect signals, global signals, or the chip-wide reset.
(2) APEX 20KE devices have four dedicated clocks.

Single-Port Mode

The APEX 20K ESB also supports a single-port mode, which is used when simultaneous reads and writes are not required. See Figure 22.

Figure 23. APEX 20KE CAM Block Diagram



CAM can be used in any application requiring high-speed searches, such as networking, communications, data compression, and cache management.

The APEX 20KE on-chip CAM provides faster system performance than traditional discrete CAM. Integrating CAM and logic into the APEX 20KE device eliminates off-chip and on-chip delays, improving system performance.

When in CAM mode, the ESB implements 32-word, 32-bit CAM. Wider or deeper CAM can be implemented by combining multiple CAMs with some ancillary logic implemented in LEs. The Quartus II software combines ESBs and LEs automatically to create larger CAMs.

CAM supports writing "don't care" bits into words of the memory. The "don't-care" bit can be used as a mask for CAM comparisons; any bit set to "don't-care" has no effect on matches.

The output of the CAM can be encoded or unencoded. When encoded, the ESB outputs an encoded address of the data's location. For instance, if the data is located in address `12`, the ESB output is `12`. When unencoded, the ESB uses its 16 outputs to show the location of the data over two clock cycles. In this case, if the data is located in address `12`, the 12th output line goes high. When using unencoded outputs, two clock cycles are required to read the output because a 16-bit output bus is used to show the status of 32 words.

The encoded output is better suited for designs that ensure duplicate data is not written into the CAM. If duplicate data is written into two locations, the CAM's output will be incorrect. If the CAM may contain duplicate data, the unencoded output is a better solution; CAM with unencoded outputs can distinguish multiple data locations.

CAM can be pre-loaded with data during configuration, or it can be written during system operation. In most cases, two clock cycles are required to write each word into CAM. When "don't-care" bits are used, a third clock cycle is required.

Under hot socketing conditions, APEX 20KE devices will not sustain any damage, but the I/O pins will drive out.

MultiVolt I/O Interface

The APEX device architecture supports the MultiVolt I/O interface feature, which allows APEX devices in all packages to interface with systems of different supply voltages. The devices have one set of VCC pins for internal operation and input buffers (VCCINT), and another set for I/O output drivers (VCCIO).

The APEX 20K VCCINT pins must always be connected to a 2.5 V power supply. With a 2.5-V V_{CCINT} level, input pins are 2.5-V, 3.3-V, and 5.0-V tolerant. The VCCIO pins can be connected to either a 2.5-V or 3.3-V power supply, depending on the output requirements. When VCCIO pins are connected to a 2.5-V power supply, the output levels are compatible with 2.5-V systems. When the VCCIO pins are connected to a 3.3-V power supply, the output high is 3.3 V and is compatible with 3.3-V or 5.0-V systems.

Table 12 summarizes 5.0-V tolerant APEX 20K MultiVolt I/O support.

Table 12. 5.0-V Tolerant APEX 20K MultiVolt I/O Support

V_{CCIO} (V)	Input Signals (V)			Output Signals (V)		
	2.5	3.3	5.0	2.5	3.3	5.0
2.5	✓	✓(1)	✓(1)	✓		
3.3	✓	✓	✓(1)	✓(2)	✓	✓

Notes to Table 12:

(1) The PCI clamping diode must be disabled to drive an input with voltages higher than V_{CCIO}.

(2) When V_{CCIO} = 3.3 V, an APEX 20K device can drive a 2.5-V device with 3.3-V tolerant inputs.

Open-drain output pins on 5.0-V tolerant APEX 20K devices (with a pull-up resistor to the 5.0-V supply) can drive 5.0-V CMOS input pins that require a V_{IH} of 3.5 V. When the pin is inactive, the trace will be pulled up to 5.0 V by the resistor. The open-drain pin will only drive low or tri-state; it will never drive high. The rise time is dependent on the value of the pull-up resistor and load impedance. The I_{OL} current specification should be considered when selecting a pull-up resistor.

The APEX 20K device instruction register length is 10 bits. The APEX 20K device USERCODE register length is 32 bits. Tables 20 and 21 show the boundary-scan register length and device IDCODE information for APEX 20K devices.

Table 20. APEX 20K Boundary-Scan Register Length

Device	Boundary-Scan Register Length
EP20K30E	420
EP20K60E	624
EP20K100	786
EP20K100E	774
EP20K160E	984
EP20K200	1,176
EP20K200E	1,164
EP20K300E	1,266
EP20K400	1,536
EP20K400E	1,506
EP20K600E	1,806
EP20K1000E	2,190
EP20K1500E	1 *(1)*

Note to Table 20:
(1) This device does not support JTAG boundary scan testing.

Table 26. APEX 20K 5.0-V Tolerant Device Capacitance *Notes (2), (14)*

Symbol	Parameter	Conditions	Min	Max	Unit
C_{IN}	Input capacitance	V_{IN} = 0 V, f = 1.0 MHz		8	pF
C_{INCLK}	Input capacitance on dedicated clock pin	V_{IN} = 0 V, f = 1.0 MHz		12	pF
C_{OUT}	Output capacitance	V_{OUT} = 0 V, f = 1.0 MHz		8	pF

Notes to Tables 23 through 26:

(1) See the *Operating Requirements for Altera Devices Data Sheet*.
(2) All APEX 20K devices are 5.0-V tolerant.
(3) Minimum DC input is –0.5 V. During transitions, the inputs may undershoot to –2.0 V or overshoot to 5.75 V for input currents less than 100 mA and periods shorter than 20 ns.
(4) Numbers in parentheses are for industrial-temperature-range devices.
(5) Maximum V_{CC} rise time is 100 ms, and V_{CC} must rise monotonically.
(6) All pins, including dedicated inputs, clock I/O, and JTAG pins, may be driven before V_{CCINT} and V_{CCIO} are powered.
(7) Typical values are for T_A = 25° C, V_{CCINT} = 2.5 V, and V_{CCIO} = 2.5 or 3.3 V.
(8) These values are specified in the APEX 20K device recommended operating conditions, shown in Table 26 on page 62.
(9) The APEX 20K input buffers are compatible with 2.5-V and 3.3-V (LVTTL and LVCMOS) signals. Additionally, the input buffers are 3.3-V PCI compliant when V_{CCIO} and V_{CCINT} meet the relationship shown in Figure 33 on page 68.
(10) The I_{OH} parameter refers to high-level TTL, PCI or CMOS output current.
(11) The I_{OL} parameter refers to low-level TTL, PCI, or CMOS output current. This parameter applies to open-drain pins as well as output pins.
(12) This value is specified for normal device operation. The value may vary during power-up.
(13) Pin pull-up resistance values will be lower if an external source drives the pin higher than V_{CCIO}.
(14) Capacitance is sample-tested only.

Tables 27 through 30 provide information on absolute maximum ratings, recommended operating conditions, DC operating conditions, and capacitance for 1.8-V APEX 20KE devices.

Table 27. APEX 20KE Device Absolute Maximum Ratings *Note (1)*

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CCINT}	Supply voltage	With respect to ground *(2)*	–0.5	2.5	V
V_{CCIO}			–0.5	4.6	V
V_I	DC input voltage		–0.5	4.6	V
I_{OUT}	DC output current, per pin		–25	25	mA
T_{STG}	Storage temperature	No bias	–65	150	° C
T_{AMB}	Ambient temperature	Under bias	–65	135	° C
T_J	Junction temperature	PQFP, RQFP, TQFP, and BGA packages, under bias		135	° C
		Ceramic PGA packages, under bias		150	° C

Table 29. APEX 20KE Device DC Operating Conditions *Notes (7), (8), (9)*

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IH}	High-level LVTTL, CMOS, or 3.3-V PCI input voltage		1.7, 0.5 × V_{CCIO} *(10)*		4.1	V
V_{IL}	Low-level LVTTL, CMOS, or 3.3-V PCI input voltage		–0.5		0.8, 0.3 × V_{CCIO} *(10)*	V
V_{OH}	3.3-V high-level LVTTL output voltage	I_{OH} = –12 mA DC, V_{CCIO} = 3.00 V *(11)*	2.4			V
	3.3-V high-level LVCMOS output voltage	I_{OH} = –0.1 mA DC, V_{CCIO} = 3.00 V *(11)*	V_{CCIO} – 0.2			V
	3.3-V high-level PCI output voltage	I_{OH} = –0.5 mA DC, V_{CCIO} = 3.00 to 3.60 V *(11)*	0.9 × V_{CCIO}			V
	2.5-V high-level output voltage	I_{OH} = –0.1 mA DC, V_{CCIO} = 2.30 V *(11)*	2.1			V
		I_{OH} = –1 mA DC, V_{CCIO} = 2.30 V *(11)*	2.0			V
		I_{OH} = –2 mA DC, V_{CCIO} = 2.30 V *(11)*	1.7			V
V_{OL}	3.3-V low-level LVTTL output voltage	I_{OL} = 12 mA DC, V_{CCIO} = 3.00 V *(12)*			0.4	V
	3.3-V low-level LVCMOS output voltage	I_{OL} = 0.1 mA DC, V_{CCIO} = 3.00 V *(12)*			0.2	V
	3.3-V low-level PCI output voltage	I_{OL} = 1.5 mA DC, V_{CCIO} = 3.00 to 3.60 V *(12)*			0.1 × V_{CCIO}	V
	2.5-V low-level output voltage	I_{OL} = 0.1 mA DC, V_{CCIO} = 2.30 V *(12)*			0.2	V
		I_{OL} = 1 mA DC, V_{CCIO} = 2.30 V *(12)*			0.4	V
		I_{OL} = 2 mA DC, V_{CCIO} = 2.30 V *(12)*			0.7	V
I_I	Input pin leakage current	V_I = 4.1 to –0.5 V *(13)*	–10		10	µA
I_{OZ}	Tri-stated I/O pin leakage current	V_O = 4.1 to –0.5 V *(13)*	–10		10	µA
I_{CC0}	V_{CC} supply current (standby) (All ESBs in power-down mode)	V_I = ground, no load, no toggling inputs, -1 speed grade		10		mA
		V_I = ground, no load, no toggling inputs, -2, -3 speed grades		5		mA
R_{CONF}	Value of I/O pin pull-up resistor before and during configuration	V_{CCIO} = 3.0 V *(14)*	20		50	kΩ
		V_{CCIO} = 2.375 V *(14)*	30		80	kΩ
		V_{CCIO} = 1.71 V *(14)*	60		150	kΩ

Figure 39. ESB Synchronous Timing Waveforms

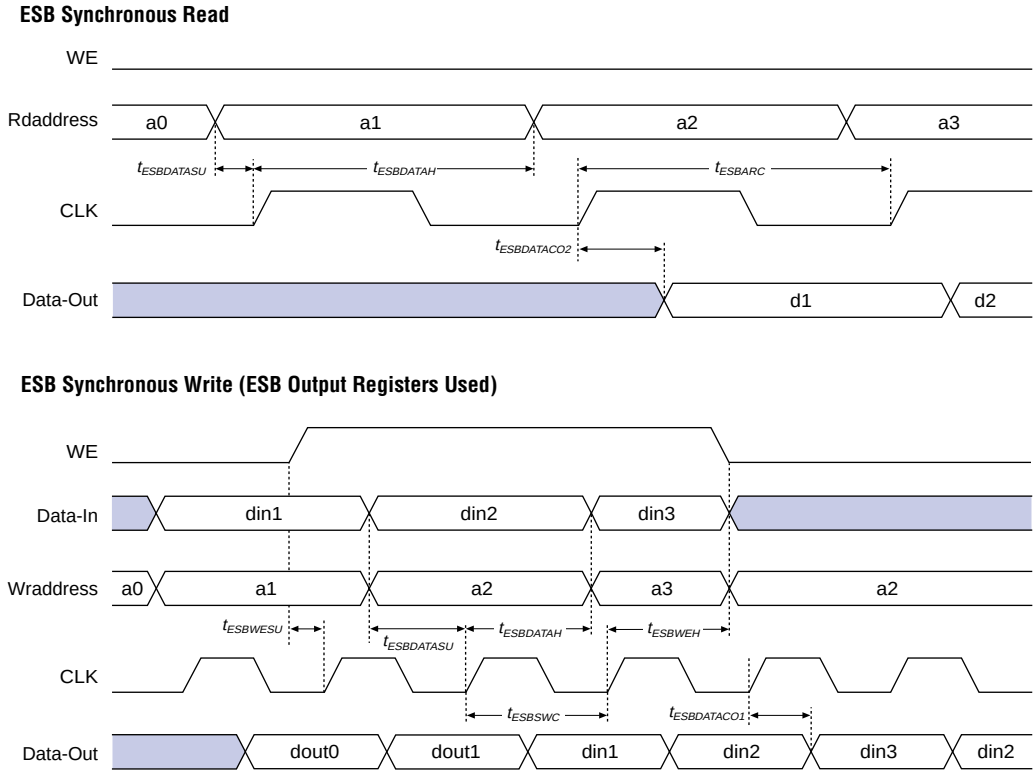


Figure 40 shows the timing model for bidirectional I/O pin timing.

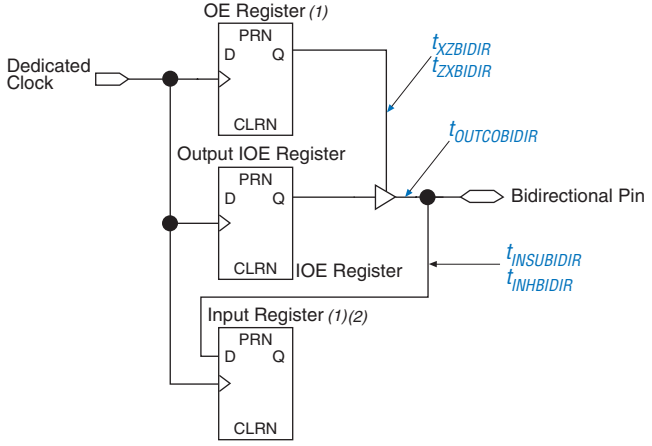
Figure 40. Synchronous Bidirectional Pin External Timing



Notes to Figure 40:

(1) The output enable and input registers are LE registers in the LAB adjacent to a bidirectional row pin. The output enable register is set with "Output Enable Routing= Signal-Pin" option in the Quartus II software.

(2) The LAB adjacent input register is set with "Decrease Input Delay to Internal Cells= Off". This maintains a zero hold time for lab adjacent registers while giving a fast, position independent setup time. A faster setup time with zero hold time is possible by setting "Decrease Input Delay to Internal Cells= ON" and moving the input register farther away from the bidirectional pin. The exact position where zero hold occurs with the minimum setup time, varies with device density and speed grade.

Table 31 describes the f_{MAX} timing parameters shown in Figure 36 on page 68.

Table 31. APEX 20K f_{MAX} Timing Parameters (Part 1 of 2)

Symbol	Parameter
t_{SU}	LE register setup time before clock
t_{H}	LE register hold time after clock
t_{CO}	LE register clock-to-output delay
t_{LUT}	LUT delay for data-in
t_{ESBRC}	ESB Asynchronous read cycle time
t_{ESBWC}	ESB Asynchronous write cycle time
$t_{ESBWESU}$	ESB WE setup time before clock when using input register
$t_{ESBDATASU}$	ESB data setup time before clock when using input register
$t_{ESBDATAH}$	ESB data hold time after clock when using input register
$t_{ESBADDRSU}$	ESB address setup time before clock when using input registers
$t_{ESBDATACO1}$	ESB clock-to-output delay when using output registers

Table 31. APEX 20K f_{MAX} Timing Parameters (Part 2 of 2)	
Symbol	**Parameter**
$t_{ESBDATACO2}$	ESB clock-to-output delay without output registers
t_{ESBDD}	ESB data-in to data-out delay for RAM mode
t_{PD}	ESB macrocell input to non-registered output
$t_{PTERMSU}$	ESB macrocell register setup time before clock
$t_{PTERMCO}$	ESB macrocell register clock-to-output delay
t_{F1-4}	Fanout delay using local interconnect
t_{F5-20}	Fanout delay using MegaLab Interconnect
t_{F20+}	Fanout delay using FastTrack Interconnect
t_{CH}	Minimum clock high time from clock pin
t_{CL}	Minimum clock low time from clock pin
t_{CLRP}	LE clear pulse width
t_{PREP}	LE preset pulse width
t_{ESBCH}	Clock high time
t_{ESBCL}	Clock low time
t_{ESBWP}	Write pulse width
t_{ESBRP}	Read pulse width

Tables 32 and 33 describe APEX 20K external timing parameters.

Table 32. APEX 20K External Timing Parameters *Note (1)*	
Symbol	**Clock Parameter**
t_{INSU}	Setup time with global clock at IOE register
t_{INH}	Hold time with global clock at IOE register
t_{OUTCO}	Clock-to-output delay with global clock at IOE register

Table 33. APEX 20K External Bidirectional Timing Parameters *Note (1)*		
Symbol	**Parameter**	**Conditions**
$t_{INSUBIDIR}$	Setup time for bidirectional pins with global clock at same-row or same-column LE register	
$t_{INHBIDIR}$	Hold time for bidirectional pins with global clock at same-row or same-column LE register	
$t_{OUTCOBIDIR}$	Clock-to-output delay for bidirectional pins with global clock at IOE register	C1 = 10 pF
$t_{XZBIDIR}$	Synchronous IOE output buffer disable delay	C1 = 10 pF
$t_{ZXBIDIR}$	Synchronous IOE output buffer enable delay, slow slew rate = off	C1 = 10 pF
