Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Not For New Designs
Core Processor	HCS12
Core Size	16-Bit
Speed	25MHz
Connectivity	CANbus, I²C, SCI, SPI
Peripherals	PWM, WDT
Number of I/O	59
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	4K x 8
Voltage - Supply (Vcc/Vdd)	2.35V ~ 5.25V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	80-QFP
Supplier Device Package	80-QFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/s9s12d64f0vfue

Version Number	Revision Date	Effective Date	Author	Description of Changes
V01.15	22 July 2003	22 July 2003		Mentioned "S12 LRAE" bootloader in Flash section Section Document References: corrected S12 CPU document reference
V01.16	24 Feb. 2004	24 Feb. 2004		Added 3L86D maskset with corresponding Part ID Table Oscillator Characteristics: Added more details for EXTAL pin
V01.17	21 May 2004	21 May 2004		Added 4L86D maskset with corresponding Part ID Table "MC9S12DJ64 Memory Map out of Reset": corrected $1000 - $3fff memory in single chip modes to "unimplemented".
V01.18	13 July 2004	13 July 2004		Added MC9S12D32 and MC9S12A32
V01.19	2 Sept. 2004	2 Sept. 2004		Appendix, Table "Oscillator Characteristics": changed item 13 VIH,EXTAL min value from 0.7*VDDPLL to 0.75*VDDPLL item 14 VIL,EXTAL max value from 0.3*VDDPLL to 0.25*VDDPLL
V01.20	6 April 2005	6 April 2005		Table "Assigned Part ID Numbers": added mask set number 0M89C Table "NVM Reliability Characteristics": added footnote concerning data retention

2.3.38 PM3 / TXCAN0 / $\overline{\text{SS0}}$ — Port M I/O Pin 3

PM3 is a general purpose input or output pin. It can be configured as the transmit pin TXCAN of the Freescale Scalable Controller Area Network controller 0 (CAN0). It can be configured as the slave select pin $\overline{\text{SS}}$ of the Serial Peripheral Interface 0 (SPI0).

2.3.39 PM2 / RXCAN0 / MISO0 — Port M I/O Pin 2

PM2 is a general purpose input or output pin. It can be configured as the receive pin RXCAN of the Freescale Scalable Controller Area Network controller 0 (CAN0). It can be configured as the master input (during master mode) or slave output pin (during slave mode) MISO for the Serial Peripheral Interface 0 (SPI0).

2.3.40 PM1 / TXCAN0 / TXB — Port M I/O Pin 1

PM1 is a general purpose input or output pin. It can be configured as the transmit pin TXCAN of the Freescale Scalable Controller Area Network controller 0 (CAN0). It can be configured as the transmit pin TXB of the BDLC.

2.3.41 PM0 / RXCAN0 / RXB — Port M I/O Pin 0

PM0 is a general purpose input or output pin. It can be configured as the receive pin RXCAN of the Freescale Scalable Controller Area Network controller 0 (CAN0). It can be configured as the receive pin RXB of the BDLC.

2.3.42 PP7 / KWP7 / PWM7 — Port P I/O Pin 7

PP7 is a general purpose input or output pin. It can be configured to generate an interrupt causing the MCU to exit STOP or WAIT mode. It can be configured as Pulse Width Modulator (PWM) channel 7 output.

2.3.43 PP6 / KWP6 / PWM6 — Port P I/O Pin 6

PP6 is a general purpose input or output pin. It can be configured to generate an interrupt causing the MCU to exit STOP or WAIT mode. It can be configured as Pulse Width Modulator (PWM) channel 6 output.

2.3.44 PP5 / KWP5 / PWM5 — Port P I/O Pin 5

PP5 is a general purpose input or output pin. It can be configured to generate an interrupt causing the MCU to exit STOP or WAIT mode. It can be configured as Pulse Width Modulator (PWM) channel 5 output.

2.3.45 PP4 / KWP4 / PWM4 — Port P I/O Pin 4

PP4 is a general purpose input or output pin. It can be configured to generate an interrupt causing the MCU to exit STOP or WAIT mode. It can be configured as Pulse Width Modulator (PWM) channel 4 output.

Table 4-2 Clock Selection Based on PE7

PE7 = $\overline{\text{XCLKS}}$	Description
0	Pierce Oscillator/external clock selected

Table 4-3 Voltage Regulator VREGEN

VREGEN	Description
1	Internal Voltage Regulator enabled
0	Internal Voltage Regulator disabled, VDD1,2 and VDDPLL must be supplied externally with 2.5V

4.3 Security

The device will make available a security feature preventing the unauthorized read and write of the memory contents. This feature allows:

- Protection of the contents of FLASH,
- Protection of the contents of EEPROM,
- Operation in single-chip mode,
- Operation from external memory with internal FLASH and EEPROM disabled.

The user must be reminded that part of the security must lie with the user’s code. An extreme example would be user’s code that dumps the contents of the internal program. This code would defeat the purpose of security. At the same time the user may also wish to put a back door in the user’s program. An example of this is the user downloads a key through the SCI which allows access to a programming routine that updates parameters stored in EEPROM.

4.3.1 Securing the Microcontroller

Once the user has programmed the FLASH and EEPROM (if desired), the part can be secured by programming the security bits located in the FLASH module. These non-volatile bits will keep the part secured through resetting the part and through powering down the part.

The security byte resides in a portion of the Flash array.

Check the Flash Block User Guide for more details on the security configuration.

4.3.2 Operation of the Secured Microcontroller

4.3.2.1 Normal Single Chip Mode

This will be the most common usage of the secured part. Everything will appear the same as if the part was not secured with the exception of BDM operation. The BDM operation will be blocked.

4.3.2.2 Executing from External Memory

The user may wish to execute from external space with a secured microcontroller. This is accomplished by resetting directly into expanded mode. The internal FLASH and EEPROM will be disabled. BDM operations will be blocked.

4.3.3 Unsecuring the Microcontroller

In order to unsecure the microcontroller, the internal FLASH and EEPROM must be erased. This can be done through an external program in expanded mode or via a sequence of BDM commands. Unsecuring is also possible via the Backdoor Key Access. Refer to Flash Block Guide for details.

Once the user has erased the FLASH and EEPROM, the part can be reset into special single chip mode. This invokes a program that verifies the erasure of the internal FLASH and EEPROM. Once this program completes, the user can erase and program the FLASH security bits to the unsecured state. This is generally done through the BDM, but the user could also change to expanded mode (by writing the mode bits through the BDM) and jumping to an external program (again through BDM commands). Note that if the part goes through a reset before the security bits are reprogrammed to the unsecure state, the part will be secured again.

4.4 Low Power Modes

The microcontroller features three main low power modes. Consult the respective Block User Guide for information on the module behavior in Stop, Pseudo Stop, and Wait Mode. An important source of information about the clock system is the Clock and Reset Generator User Guide (CRG).

4.4.1 Stop

Executing the CPU STOP instruction stops all clocks and the oscillator thus putting the chip in fully static mode. Wake up from this mode can be done via reset or external interrupts.

4.4.2 Pseudo Stop

This mode is entered by executing the CPU STOP instruction. In this mode the oscillator is still running and the Real Time Interrupt (RTI) or Watchdog (COP) sub module can stay active. Other peripherals are turned off. This mode consumes more current than the full STOP mode, but the wake up time from this mode is significantly shorter.

4.4.3 Wait

This mode is entered by executing the CPU WAI instruction. In this mode the CPU will not execute instructions. The internal CPU signals (address and data bus) will be fully static. All peripherals stay active. For further power consumption the peripherals can individually turn off their local clocks.

4.4.4 Run

Although this is not a low power mode, unused peripheral modules should not be enabled in order to save power.

Figure 22-1 Recommended PCB Layout 112LQFP Colpitts Oscillator

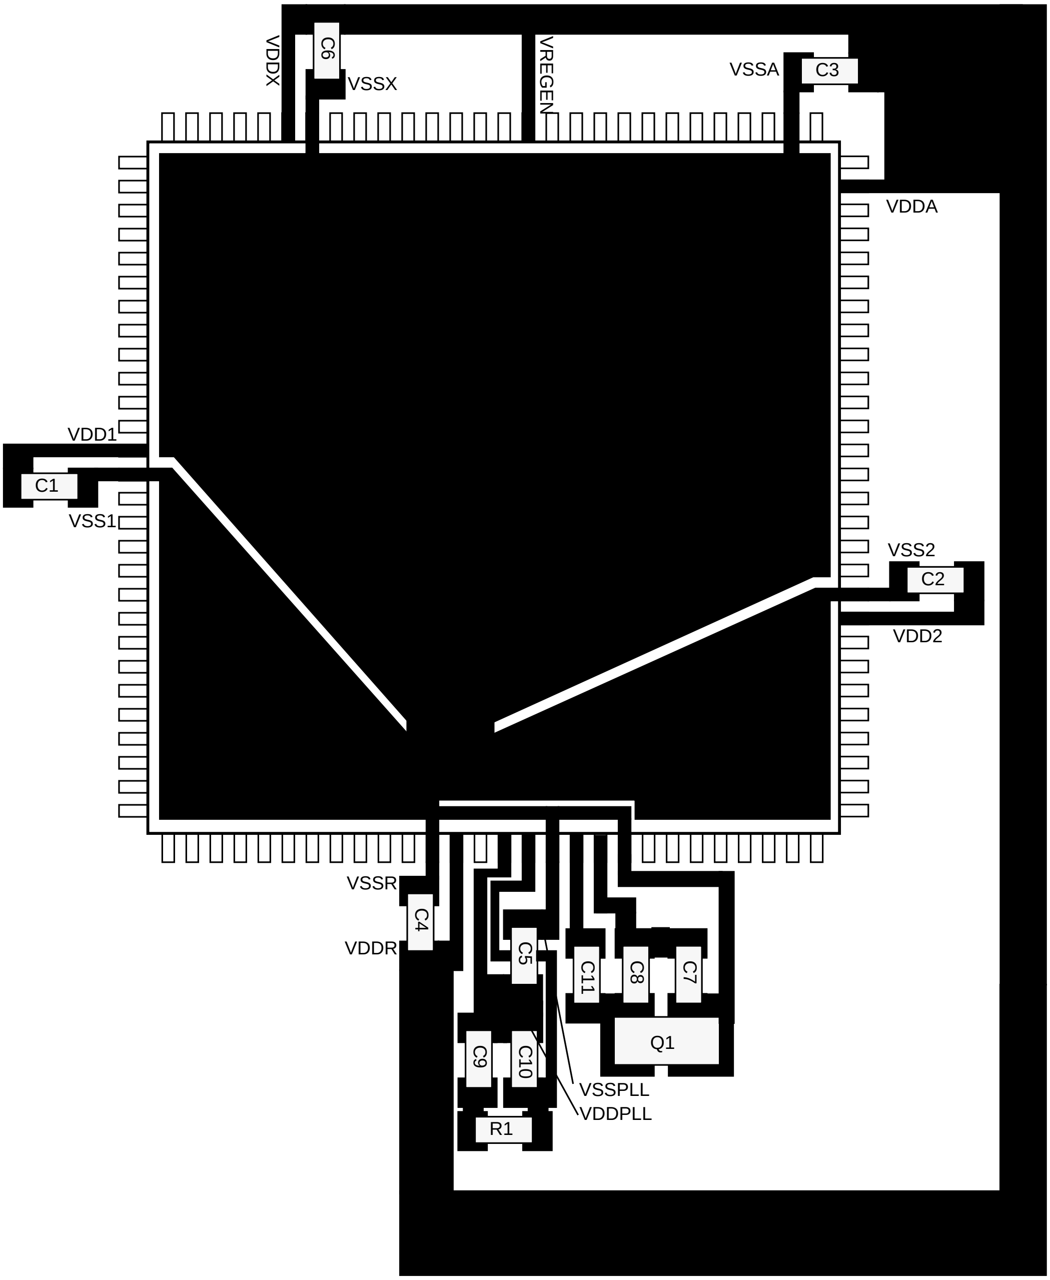

Figure 22-2 Recommended PCB Layout for 80QFP Colpitts Oscillator

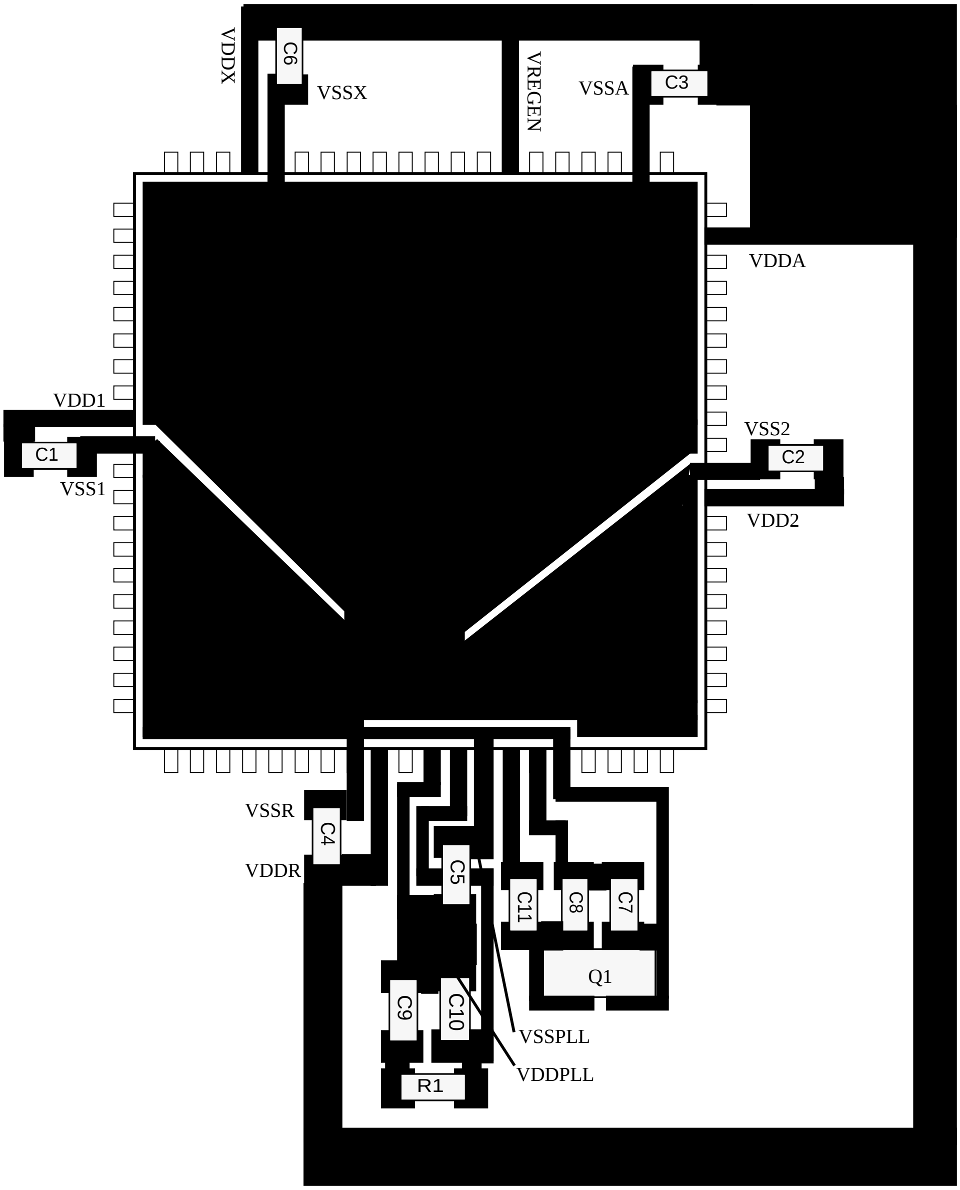

NOTE: *Please refer to the temperature rating of the device (C, V, M) with regards to the ambient temperature T_A and the junction temperature T_J. For power dissipation calculations refer to* ***Section A.1.8 Power Dissipation and Thermal Characteristics****.*

Table A-4 Operating Conditions

Rating	Symbol	Min	Typ	Max	Unit
I/O, Regulator and Analog Supply Voltage	V_{DD5}	4.5	5	5.25	V
Digital Logic Supply Voltage [1]	V_{DD}	2.35	2.5	2.75	V
PLL Supply Voltage [1]	V_{DDPLL}	2.35	2.5	2.75	V
Voltage Difference VDDX to VDDR and VDDA	Δ_{VDDX}	-0.1	0	0.1	V
Voltage Difference VSSX to VSSR and VSSA	Δ_{VSSX}	-0.1	0	0.1	V
Oscillator	f_{osc}	0.5	-	16	MHz
Bus Frequency	f_{bus}	0.25[2]	-	25	MHz
MC9S12DJ64**C** Operating Junction Temperature Range	T_J	-40	-	100	°C
Operating Ambient Temperature Range [3]	T_A	-40	27	85	°C
MC9S12DJ64**V** Operating Junction Temperature Range	T_J	-40	-	120	°C
Operating Ambient Temperature Range [3]	T_A	-40	27	105	°C
MC9S12DJ64**M** Operating Junction Temperature Range	T_J	-40	-	140	°C
Operating Ambient Temperature Range [3]	T_A	-40	27	125	°C

NOTES:

1. The device contains an internal voltage regulator to generate the logic and PLL supply out of the I/O supply. The given operating range applies when this regulator is disabled and the device is powered from an external source.
2. Some blocks e.g. ATD (conversion) and NVMs (program/erase) require higher bus frequencies for proper operation.
3. Please refer to **Section A.1.8 Power Dissipation and Thermal Characteristics** for more details about the relation between ambient temperature T_A and device junction temperature T_J.

A.1.8 Power Dissipation and Thermal Characteristics

Power dissipation and thermal characteristics are closely related. The user must assure that the maximum operating junction temperature is not exceeded. The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \bullet \Theta_{JA})$$

T_J = Junction Temperature, [°C]

NOTES:

1. PLL off
2. At those low power dissipation levels $T_J = T_A$ can be assumed

A.3 NVM, Flash and EEPROM

NOTE: *Unless otherwise noted the abbreviation NVM (Non Volatile Memory) is used for both Flash and EEPROM.*

A.3.1 NVM timing

The time base for all NVM program or erase operations is derived from the oscillator. A minimum oscillator frequency f_{NVMOSC} is required for performing program or erase operations. The NVM modules do not have any means to monitor the frequency and will not prevent program or erase operation at frequencies above or below the specified minimum. Attempting to program or erase the NVM modules at a lower frequency a full program or erase transition is not assured.

The Flash and EEPROM program and erase operations are timed using a clock derived from the oscillator using the FCLKDIV and ECLKDIV registers respectively. The frequency of this clock must be set within the limits specified as f_{NVMOP}.

The minimum program and erase times shown in **Table A-11** are calculated for maximum f_{NVMOP} and maximum f_{bus}. The maximum times are calculated for minimum f_{NVMOP} and a f_{bus} of 2MHz.

A.3.1.1 Single Word Programming

The programming time for single word programming is dependant on the bus frequency as a well as on the frequency f_{NVMOP} and can be calculated according to the following formula.

$$t_{swpgm} = 9 \cdot \frac{1}{f_{NVMOP}} + 25 \cdot \frac{1}{f_{bus}}$$

A.3.1.2 Row Programming

This applies only to the Flash where up to 32 words in a row can be programmed consecutively by keeping the command pipeline filled. The time to program a consecutive word can be calculated as:

$$t_{bwpgm} = 4 \cdot \frac{1}{f_{NVMOP}} + 9 \cdot \frac{1}{f_{bus}}$$

The time to program a whole row is:

$$t_{brpgm} = t_{swpgm} + 31 \cdot t_{bwpgm}$$

Row programming is more than 2 times faster than single word programming.

A.3.1.3 Sector Erase

Erasing a 512 byte Flash sector or a 4 byte EEPROM sector takes:

NOTES:
1. Depending on the crystal a damping series resistor might be necessary
2. f_{osc} = 4MHz, C = 22pF.
3. Maximum value is for extreme cases using high Q, low frequency crystals
4. Only valid if Pierce oscillator/external clock mode is selected

A.5.3 Phase Locked Loop

The oscillator provides the reference clock for the PLL. The PLL´s Voltage Controlled Oscillator (VCO) is also the system clock source in self clock mode.

A.5.3.1 XFC Component Selection

This section describes the selection of the XFC components to achieve a good filter characteristics.

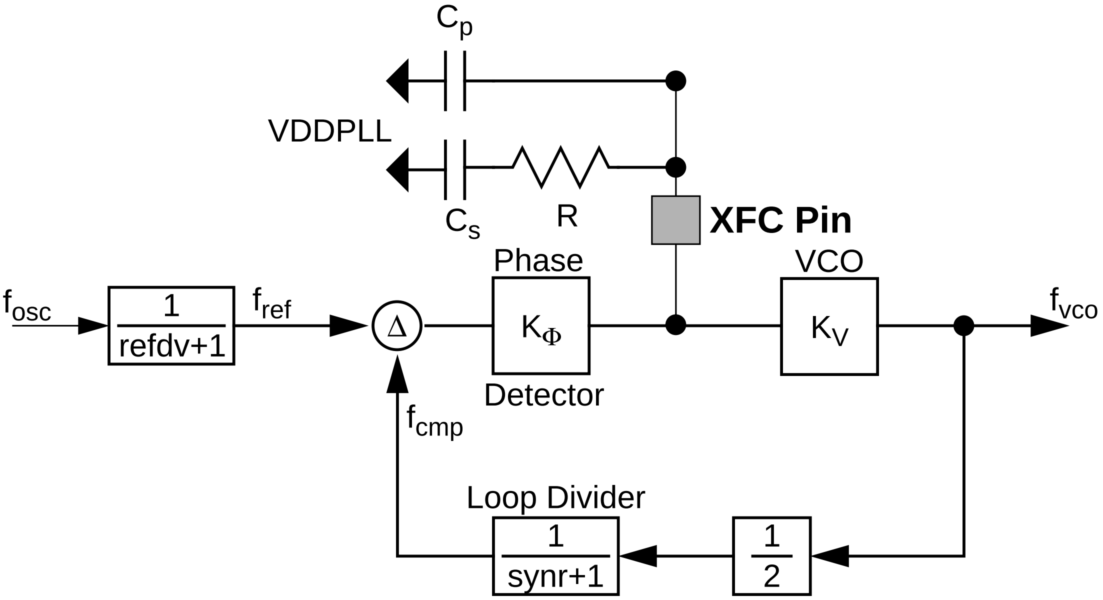

Figure A-2 Basic PLL functional diagram

The following procedure can be used to calculate the resistance and capacitance values using typical values for K_1, f_1 and i_{ch} from **Table A-16**.

The grey boxes show the calculation for f_{VCO} = 50MHz and f_{ref} = 1MHz. E.g., these frequencies are used for f_{OSC} = 4MHz and a 25MHz bus clock.

The VCO Gain at the desired VCO frequency is approximated by:

$$K_V = K_1 \cdot e^{\frac{(f_1 - f_{vco})}{K_1 \cdot 1V}} = -100 \cdot e^{\frac{(60-50)}{-100}} = -90.48\text{MHz/V}$$

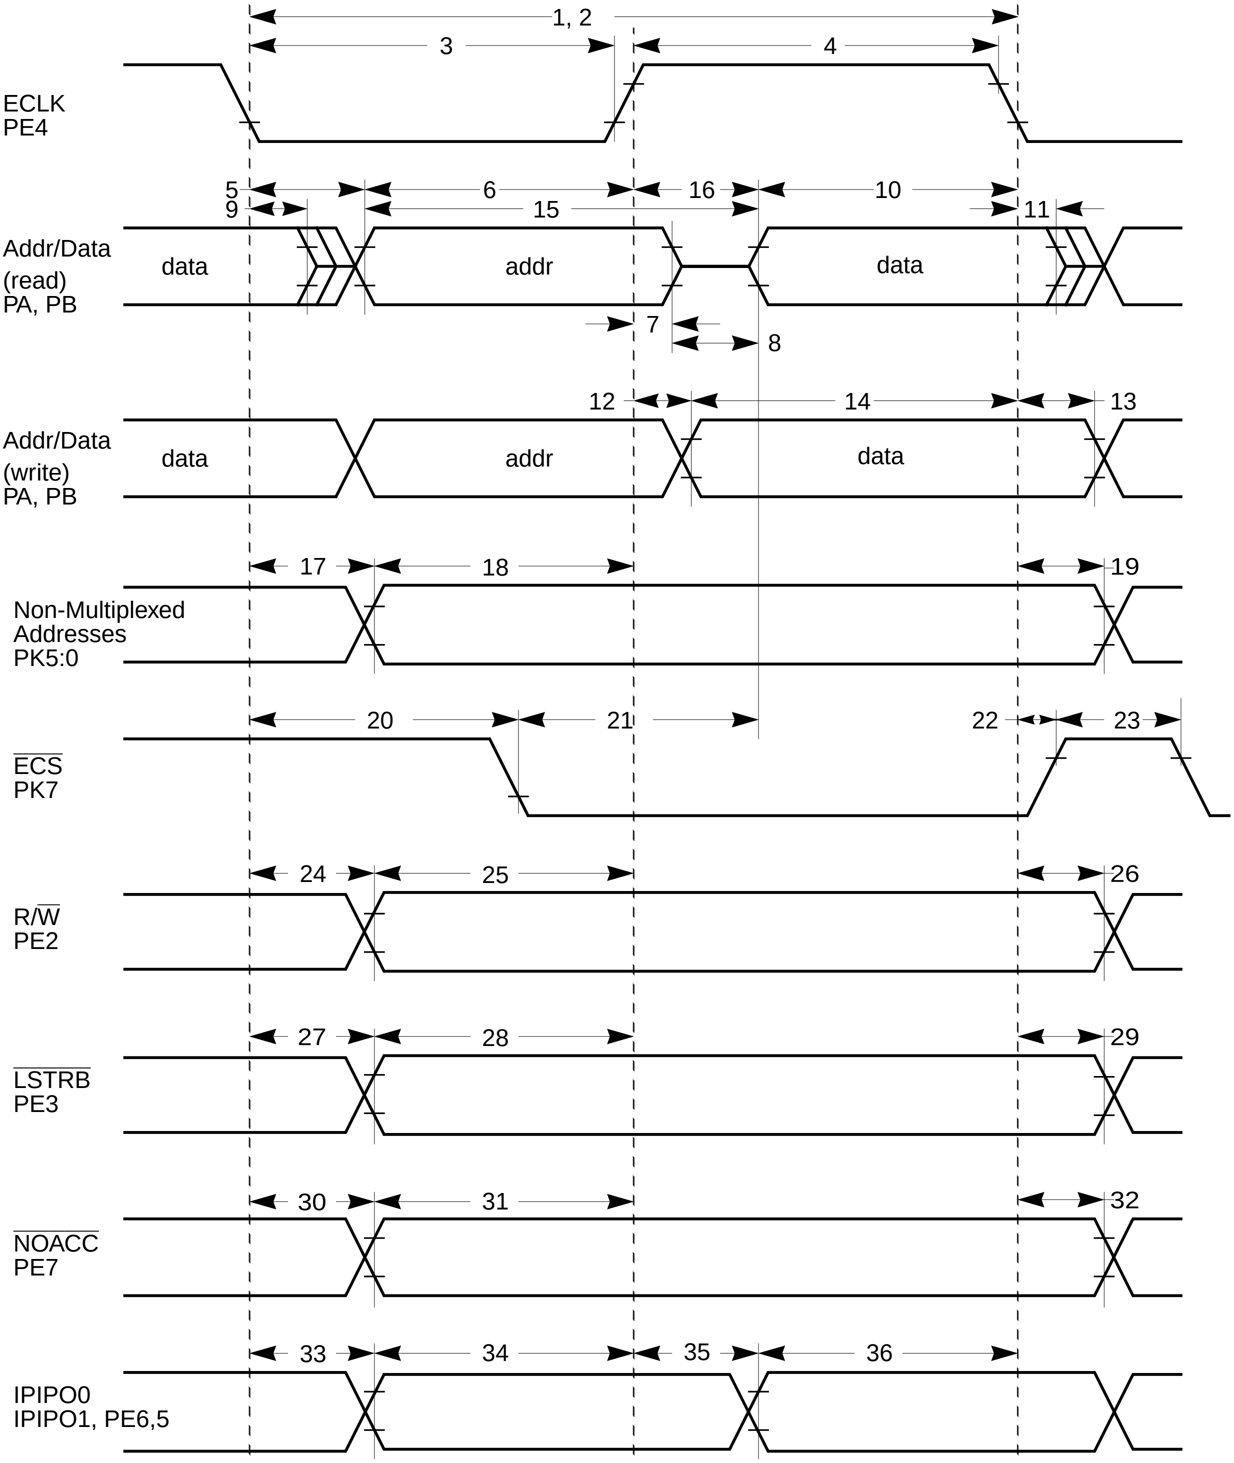

Figure A-9 General External Bus Timing

Table A-20 Expanded Bus Timing Characteristics

Conditions are shown in **Table A-4** unless otherwise noted, C_{LOAD} = 50pF

Num	C	Rating	Symbol	Min	Typ	Max	Unit
32	D	NOACC hold time	t_{NOH}	2			ns
33	D	IPIPO[1:0] delay time	t_{P0D}	2		7	ns
34	D	IPIPO[1:0] valid time to E rise (PW_{EL}–t_{P0D})	t_{P0V}	11			ns
35	D	IPIPO[1:0] delay time[1] (PW_{EH}-t_{P1V})	t_{P1D}	2		25	ns
36	D	IPIPO[1:0] valid time to E fall	t_{P1V}	11			ns

NOTES:

[1] Affected by clock stretch: add N x t_{cyc} where N=0,1,2 or 3, depending on the number of clock stretches.
