Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	138
Number of Logic Elements/Cells	1100
Total RAM Bits	65536
Number of I/O	39
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	48-VFQFN Exposed Pad
Supplier Device Package	48-QFN (7x7)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/ice5lp1k-sg48itr

iCE40 Ultra Family Data Sheet Introduction

June 2016 Data Sheet DS1048

General Description

iCE40 Ultra family is an ultra-low power FPGA and sensor manager designed for ultra-low power mobile applications, such as smartphones, tablets and hand-held devices. The iCE40 Ultra family includes integrated SPI and I^2C blocks to interface with virtually all mobile sensors and application processors. The iCE40 Ultra family also features two on-chip oscillators, 10 kHz and 48 MHz. The LFOSC (10 kHz) is ideal for low power function in always-on applications, while HFOSC (48 MHz) can be used for awaken activities.

The iCE40 Ultra family also features DSP functional block to off-load Application Processor to pre-process information sent from the mobile sensors. The embedded RGB PWM IP, with the three 24 mA constant current RGB outputs on the iCE40 Ultra provides all the necessary logic to directly drive the service LED, without the need of external MOSFET or buffer.

The 500 mA constant current IR driver output provides a direct interface to external LED for application such as IrDA functions. Users simply implement the modulation logic that meets his needs, and connect the IR driver directly to the LED, without the need of external MOSFET or buffer. This high current IR driver can also be used as Barcode Emulation, sending barcode information to external Barcode Reader.

The iCE40 Ultra family of devices are targeting for mobile applications to perform functions such as IrDA, Service LED, Barcode Emulation, GPIO Expander, SDIO Level Shift, and other custom functions.

The iCE40 Ultra family features three device densities, from 1100 to 3520 Look Up Tables (LUTs) of logic with programmable I/Os that can be used as either SPI/I^2C interface ports or general purpose I/O's. It also has up to 80 kbits of Block RAMs to work with user logic.

Features

- **Flexible Logic Architecture**
  - Three devices with 1100 to 3520 LUTs
  - Offered in WLCS, ucfBGA and QFN packages
- **Ultra-low Power Devices**
  - Advanced 40 nm ultra-low power process
  - As low as 71 µA standby current typical
- **Embedded Memory**
  - Up to 80 kbits sysMEM™ Embedded Block RAM
- **Two Hardened I^2C Interfaces**
- **Two Hardened SPI Interfaces**
- **Two On-Chip Oscillators**
  - Low Frequency Oscillator – 10 kHz
  - High Frequency Oscillator – 48 MHz
- **24 mA Current Drive RGB LED Outputs**
  - Three drive outputs in each device
  - User selectable sink current up to 24 mA
- **500 mA Current Drive IR LED Output**
  - One IR drive output in each device
  - User selectable sink current up to 500 mA
- **On-chip DSP**
  - Signed and unsigned 8-bit or 16-bit functions
  - Functions include Multiplier, Accumulator, and Multiply-Accumulate (MAC)
- **Flexible On-Chip Clocking**
  - Eight low skew global signal resource, six can be directly driven from external pins
  - One PLL with dynamic interface per device
- **Flexible Device Configuration**
  - SRAM is configured through:
    - — Standard SPI Interface
    - — Internal Nonvolatile Configuration Memory (NVCM)
- **Ultra-Small Form Factor**
  - As small as 2.078 mm x 2.078 mm
- **Applications**
  - Smartphones
  - Tablets and Consumer Handheld Devices
  - Handheld Commercial and Industrial Devices
  - Multi Sensor Management Applications
  - Sensor Pre-processing and Sensor Fusion
  - Always-On Sensor Applications
  - USB 3.1 Type C Cable Detect / Power Delivery Applications

Table 1-1. iCE40 Ultra Family Selection Guide

Part Number	iCE5LP1K	iCE5LP2K	iCE5LP4K
Logic Cells (LUT + Flip-Flop)	**1100**	**2048**	**3520**
EBR Memory Blocks	16	20	20
EBR Memory Bits	64 k	80 k	80 k
PLL Block	1	1	1
NVCM	Yes	Yes	Yes
DSP Blocks (MULT16 with 32-bit Accumulator)	2	4	4
Hardened I2C, SPI	1,1	2,2	2,2
HF Oscillator (48 MHz)	1	1	1
LF Oscillator (10 kHz)	1	1	1
24 mA LED Sink	3	3	3
500 mA LED Sink	1	1	1
Embedded PWM IP	Yes	Yes	No
Packages, ball pitch, dimension	**Total User I/O Count**		
36-ball WLCSP, 0.35 mm, 2.078 mm x 2.078 mm	26	26	26
36-ball ucfBGA, 0.40 mm, 2.5 mm x 2.5 mm	26	26	26
48-ball QFN Package, 0.5 mm, 7.0 mm x 7.0 mm	39	39	39

Introduction

The iCE40 Ultra family of ultra-low power FPGAs has three devices with densities ranging from 1100 to 3520 Look-Up Tables (LUTs) fabricated in a 40 nm Low Power CMOS process. In addition to LUT-based, low-cost programmable logic, these devices also feature Embedded Block RAM (EBR), on-chip Oscillators (LFOSC, HFOSC), two hardened I^2C Controllers, two hardened SPI Controllers, three 24 mA RGB LED open-drain drivers, a 500 mA IR LED open-drain drivers, and DSP blocks. These features allow the devices to be used in low-cost, high-volume consumer and mobile applications.

The iCE40 Ultra FPGAs are available in very small form factor packages, as small as 2.078 mm x 2.078 mm. The small form factor allows the device to easily fit into a lot of mobile applications, where space can be limited. Table 1-1 shows the LUT densities, package and I/O pin count.

The iCE40 Ultra devices offer I/O features such as pull-up resistors. Pull-up features are controllable on a “per-pin” basis.

The iCE40 Ultra devices also provide flexible, reliable and secure configuration from on-chip NVCM. These devices can also configure themselves from external SPI Flash, or be configured by an external master such as a CPU.

Lattice provides a variety of design tools that allow complex designs to be efficiently implemented using the iCE40 Ultra family of devices. Popular logic synthesis tools provide synthesis library support for iCE40 Ultra. Lattice design tools use the synthesis tool output along with the user-specified preferences and constraints to place and route the design in the iCE40 Ultra device. These tools extract the timing from the routing and back-annotate it into the design for timing verification.

Lattice provides in the iCE40 Ultra 1K and 2K device the embedded RGB PWM IP at no extra cost of LUT available to the user, to perform controlling the RGB LED function. This embedded IP allow users to control color, LED ON/OFF time, and breathe rate of the LED. For more information, please refer to Usage Guide in Lattice Design Software.

Lattice provides many pre-engineered IP (Intellectual Property) modules, including a number of reference designs, licensed free of charge, optimized for the iCE40 Ultra FPGA family. Lattice also can provide fully verified bitstream for some of the widely used target functions in mobile device applications, such as ultra-low power sensor management, gesture recognition, IR remote, barcode emulator functions. Users can use these functions as offered by Lattice, or they can use the design to create their own unique required functions. For more information regarding Lattice's reference designs or fully-verified bitstreams, please contact your local Lattice representative.

sysCLOCK Phase Locked Loops (PLLs)

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. The iCE40 Ultra devices have one sysCLOCK PLL. REFERENCECLK is the reference frequency input to the PLL and its source can come from an external I/O pin, the internal Oscillator Generators from internal routing. EXTFEEDBACK is the feedback signal to the PLL which can come from internal routing or an external I/O pin. The feedback divider is used to multiply the reference frequency and thus synthesize a higher frequency clock output.

The PLLOUT output has an output divider, thus allowing the PLL to generate different frequencies for each output. The output divider can have a value from 1 to 64 (in increments of 2X). The PLLOUT outputs can all be used to drive the iCE40 Ultra global clock network directly or general purpose routing resources can be used.

The LOCK signal is asserted when the PLL determines it has achieved lock and de-asserted if a loss of lock is detected. A block diagram of the PLL is shown in Figure 2-3.

The timing of the device registers can be optimized by programming a phase shift into the PLLOUT output clock which will advance or delay the output clock with reference to the REFERENCECLK clock. This phase shift can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after a phase adjustment on the output used as the feedback source and not relock until the tLOCK parameter has been satisfied.

There is an additional feature in the iCE40 Ultra PLL. There are 2 FPGA controlled inputs, SCLK and SDI, that allows the user logic to serially shift in data thru SDI, clocked by SCLK clock. The data shifted in would change the configuration settings of the PLL. This feature allows the PLL to be time multiplexed for different functions, with different clock rates. After the data is shifted in, user would simply pulse the RESET input of the PLL block, and the PLL will re-lock with the new settings. For more details, please refer to TN1251, iCE40 sysCLOCK PLL Design and Usage Guide.

Figure 2-3. PLL Diagram

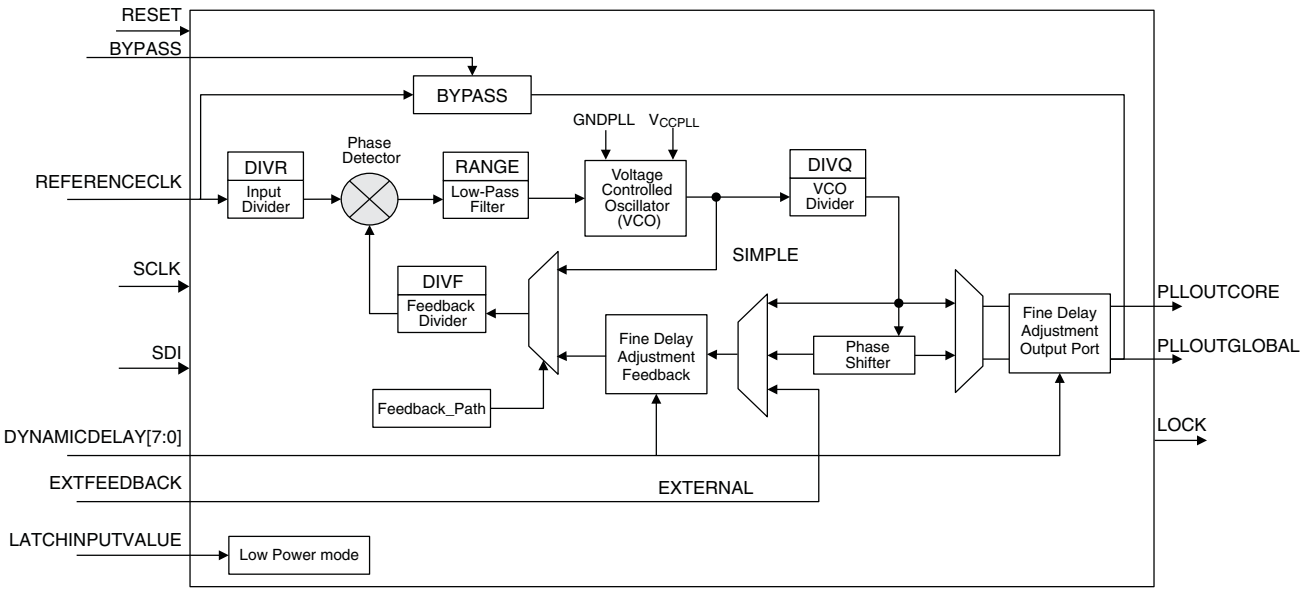

Table 2-3 provides signal descriptions of the PLL block.

Table 2-4. sysMEM Block Configurations[1]

Block RAM Configuration	Block RAM Configuration and Size	WADDR Port Size (Bits)	WDATA Port Size (Bits)	RADDR Port Size (Bits)	RDATA Port Size (Bits)	MASK Port Size (Bits)
SB_RAM256x16 SB_RAM256x16NR SB_RAM256x16NW SB_RAM256x16NRNW	256x16 (4 k)	8 [7:0]	16 [15:0]	8 [7:0]	16 [15:0]	16 [15:0]
SB_RAM512x8 SB_RAM512x8NR SB_RAM512x8NW SB_RAM512x8NRNW	512x8 (4 k)	9 [8:0]	8 [7:0]	9 [8:0]	8 [7:0]	No Mask Port
SB_RAM1024x4 SB_RAM1024x4NR SB_RAM1024x4NW SB_RAM1024x4NRNW	1024x4 (4 k)	10 [9:0]	4 [3:0]	10 [9:0]	4 [3:0]	No Mask Port
SB_RAM2048x2 SB_RAM2048x2NR SB_RAM2048x2NW SB_RAM2048x2NRNW	2048x2 (4 k)	11 [10:0]	2 [1:0]	11 [10:0]	2 [1:0]	No Mask Port

1. For iCE40 Ultra, the primitive name without "Nxx" uses rising-edge Read and Write clocks. "NR" uses rising-edge Write clock, falling-edge Read clock. "NW" uses falling-edge Write clock and rising-edge Read clock. "NRNW" uses falling-edge clocks on both Read and Write.

sysDSP

The iCE40 Ultra family provides an efficient sysDSP architecture that is very suitable for low-cost Digital Signal Processing (DSP) functions for mobile applications. Typical functions used in these applications are Multiply, Accumulate, and Multiply-Accumulate. The block can also be used for simple Add and Subtract functions.

iCE40 Ultra sysDSP Architecture Features

The iCE40 Ultra sysDSP supports many functions that include the following:

- Single 16-bit x 16-bit Multiplier, or two independent 8-bit x 8-bit Multipliers
- Optional independent pipeline control on Input Register, Output Register, and Intermediate Reg faster clock performance
- Single 32-bit Accumulator, or two independent 16-bit Accumulators
- Single 32-bit, or two independent 16-bit Adder/Subtracter functions, registered or asynchronous
- Cascadable to create wider Accumulator blocks

Figure 2-5 shows the block diagram of the sysDSP block. The block consists Multiplier section, with an bypassable Output register. The Input Register, Intermediate register between Multiplier and AC timing to achieve the highest performance.

Figure 2-5. sysDSP Functional Block Diagram (16-bit x 16-bit Multiply-Accumulate)

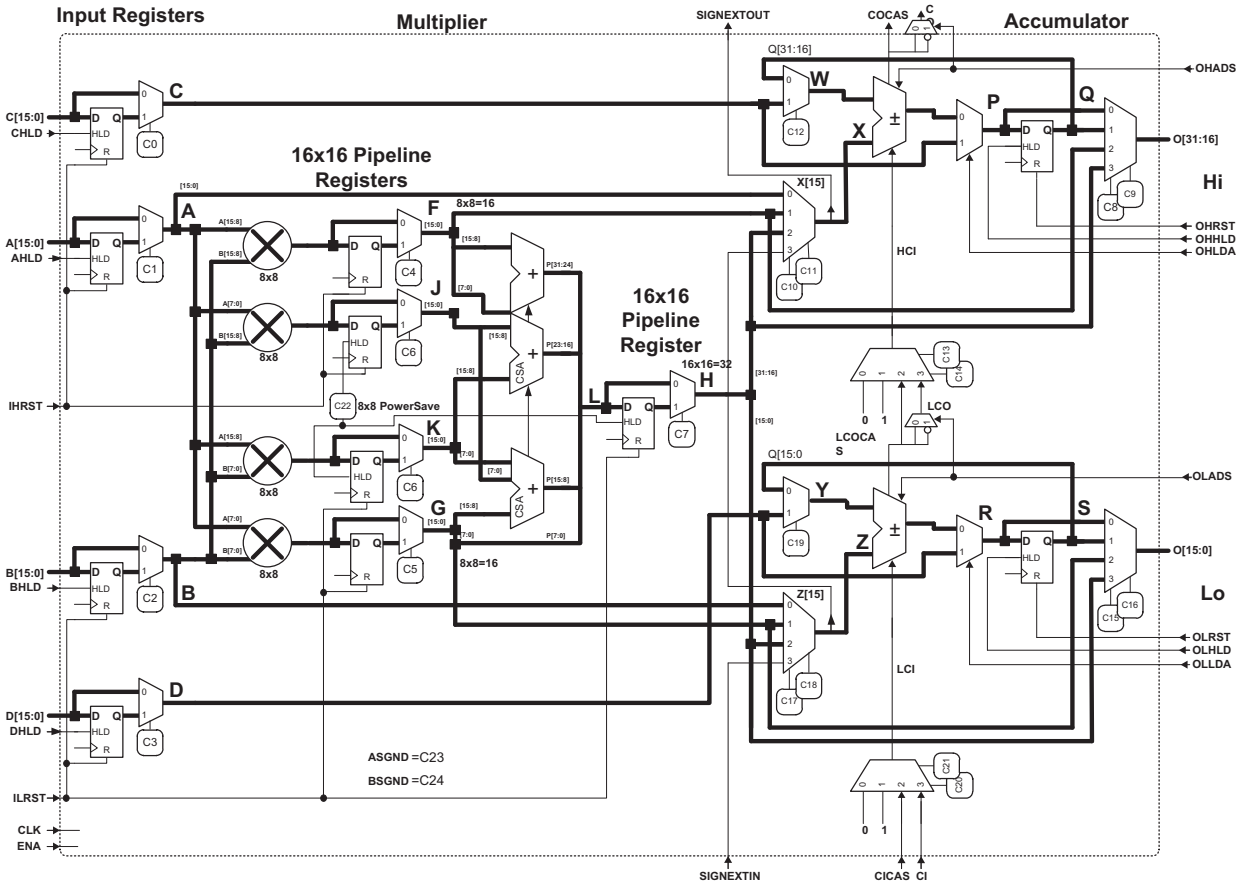

Figure 2-6. sysDSP 8-bit x 8-bit Multiplier

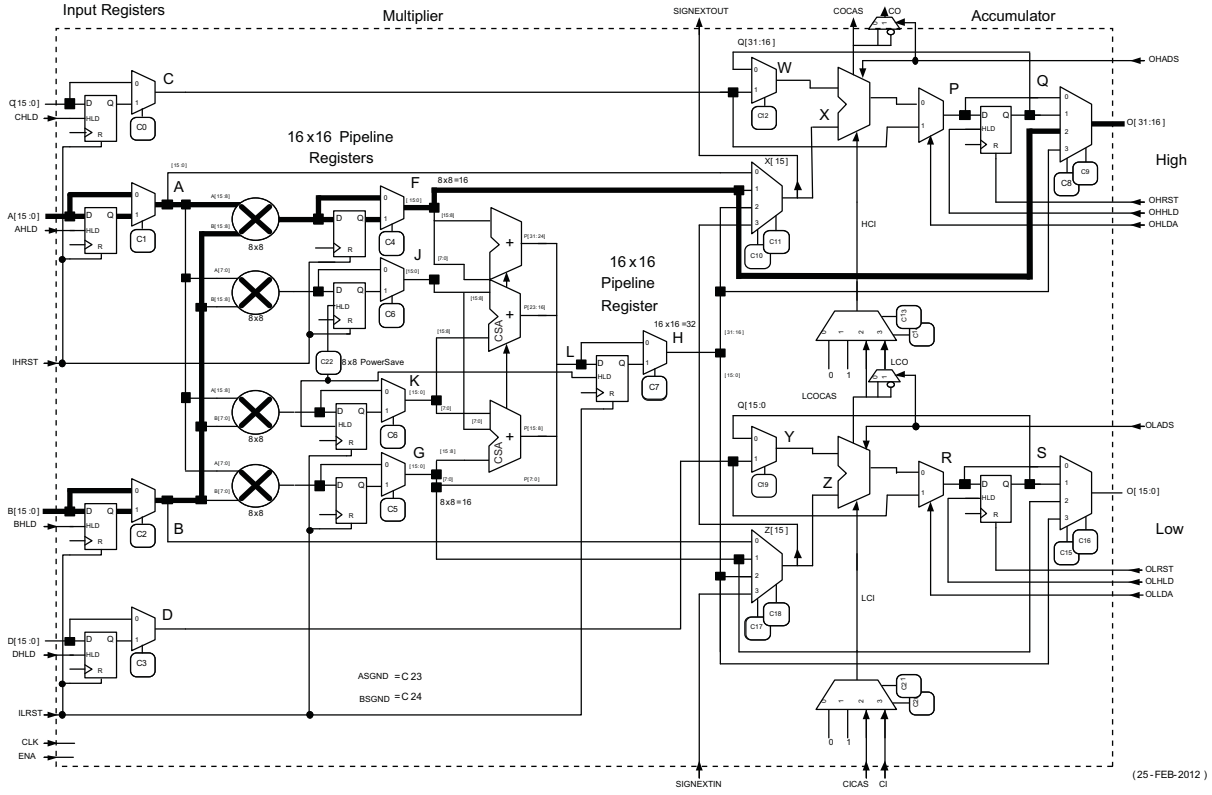

Figure 2-7 shows the path for an 16-bit x 16-bit Multiplier using the upper half of sysDSP block.

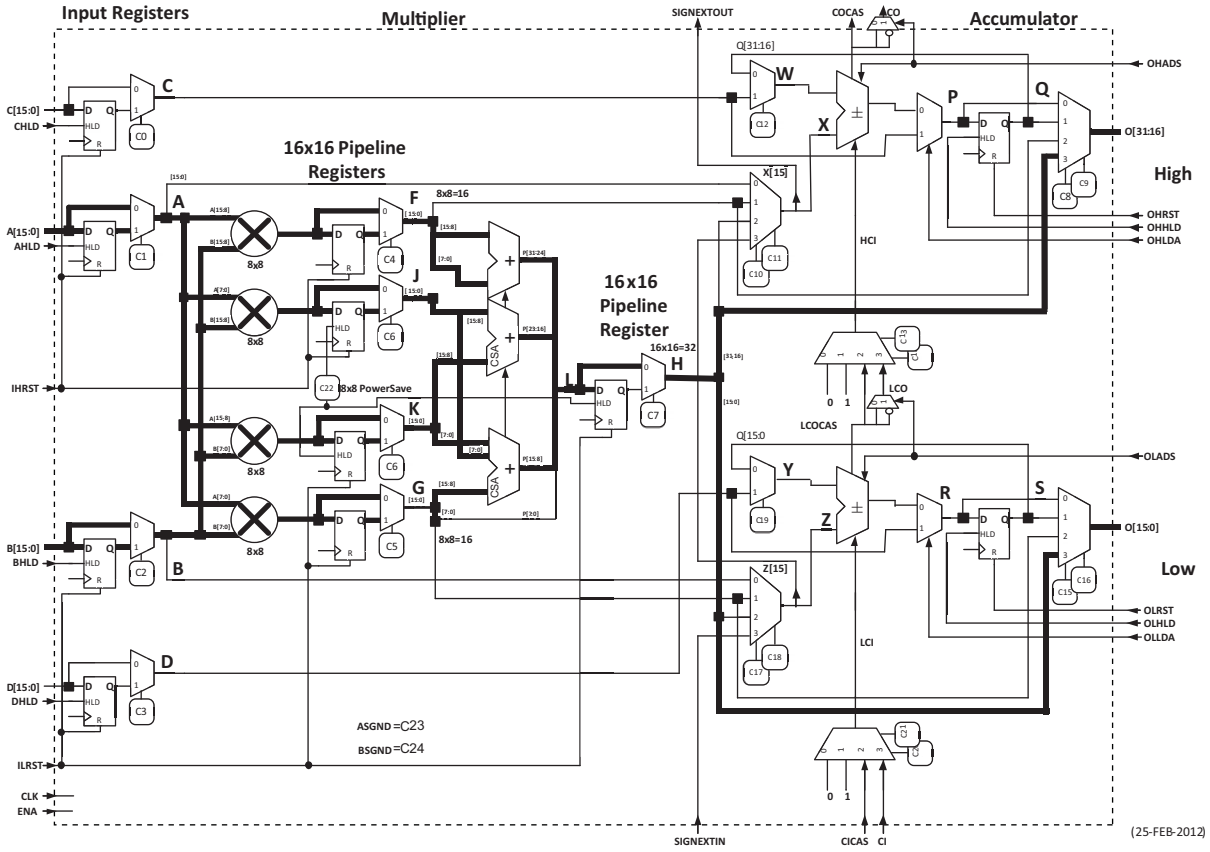
Figure 2-7. DSP 16-bit x 16-bit Multiplier



User I²C IP

The iCE40 Ultra devices have two I²C IP cores. Either of the two cores can be configured either as an I²C master or as an I²C slave. The pins for the I²C interface are not pre-assigned. User can use any General Purpose I/O pins.

In each of the two cores, there are options to delay the either the input or the output, or both, by 50 ns nominal, using dedicated on-chip delay elements. This provides an easier interface with any external I²C components.

When the IP core is configured as master, it will be able to control other devices on the I²C bus through the pre-assigned pin interface. When the core is configured as the slave, the device will be able to provide I/O expansion to an I²C Master. The I²C cores support the following functionality:

- Master and Slave operation
- 7-bit and 10-bit addressing
- Multi-master arbitration support
- Clock stretching
- Up to 400 kHz data transfer speed
- General Call support
- Optionally delaying input or output data, or both

For further information on the User I²C, please refer to TN1274, iCE40 SPI/I2C Hardened IP Usage Guide.

User SPI IP

The iCE40 Ultra devices have two SPI IP cores. The pins for the SPI interface are not pre-assigned. User can use any General Purpose I/O pins. Both SPI IP cores can be configured as a SPI master or as a slave. When the SPI IP core is configured as a master, it controls the other SPI enabled devices connected to the SPI Bus. When SPI IP core is configured as a slave, the device will be able to interface to an external SPI master.

The SPI IP core supports the following functions:

- Configurable Master and Slave modes
- Full-Duplex data transfer
- Mode fault error flag with CPU interrupt capability
- Double-buffered data register
- Serial clock with programmable polarity and phase
- LSB First or MSB First Data Transfer

For further information on the User SPI, please refer to TN1274, iCE40 SPI/I2C Hardened IP Usage Guide.

High Current LED Drive I/O Pins

The iCE40 Ultra family devices offer multiple high current LED drive outputs in each device in the family to allow the iCE40 Ultra product to drive LED signals directly on mobile applications.

There are three outputs on each device that can sink up to 24 mA current. These outputs are open-drain outputs, and provides sinking current to an LED connecting to the positive supply. These three outputs are designed to drive the RBG LEDs, such as the service LED found in a lot of mobile devices. An embedded RGB PWM IP is also offered in the family. This RGB drive current is user programmable from 4 mA to 24 mA, in increments of 4 mA. This output functions as General Purpose I/O with open-drain when the high current LED drive is not needed.

iCE40 Ultra Family Data Sheet
DC and Switching Characteristics

Absolute Maximum Ratings[1, 2, 3]

Supply Voltage V_{CC} . . . . . –0.5 V to 1.42 V

Output Supply Voltage V_{CCIO} . . . . . –0.5 V to 3.60 V

NVCM Supply Voltage V_{PP_2V5} . . . . . –0.5 V to 3.60 V

PLL Supply Voltage V_{CCPLL} . . . . . –0.5 V to 1.42 V

I/O Tri-state Voltage Applied. . . . . –0.5 V to 3.60 V

Dedicated Input Voltage Applied . . . . . –0.5 V to 3.60 V

Storage Temperature (Ambient). . . . . –65 °C to 150 °C

Junction Temperature (T_J) . . . . . –65 °C to 125 °C

1. Stress above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice Thermal Management document is required.
3. All voltages referenced to GND.

Recommended Operating Conditions[1]

Symbol	Parameter		Min.	Max.	Units
V_{CC}[1]	Core Supply Voltage		1.14	1.26	V
V_{PP_2V5}	VPP_2V5 NVCM Programming and Operating Supply Voltage	Slave SPI Configuration	1.71[4]	3.46	V
		Master SPI Configuration	2.30	3.46	V
		Configuration from NVCM	2.30	3.46	V
		NVCM Programming	2.30	3.00	V
V_{CCIO}[1, 2, 3]	I/O Driver Supply Voltage	V_{CCIO_0}, SPI_V_{CCIO1}, V_{CCIO_2}	1.71	3.46	V
V_{CCPLL}	PLL Supply Voltage		1.14	1.26	V
t_{JCOM}	Junction Temperature Commercial Operation		0	85	°C
t_{JIND}	Junction Temperature Industrial Operation		–40	100	°C
t_{PROG}	Junction Temperature NVCM Programming		10.00	30.00	°C

1. Like power supplies must be tied together if they are at the same supply voltage and they meet the power up sequence requirement. Please refer to Power-Up Supply Sequencing section. V_{CC} and V_{CCPLL} are recommended to tie to same supply with an RC-based noise filter between them. Please refer to TN1252, iCE40 Hardware Checklist.
2. See recommended voltages by I/O standard in subsequent table.
3. V_{CCIO} pins of unused I/O banks should be connected to the V_{CC} power supply on boards.
4. V_{PP_2V5} can, optionally, be connected to a 1.8 V (+/-5%) power supply in Slave SPI Configuration mode subject to the condition that none of the HFOSC/LFOSC and RGB LED / IR LED driver features are used. Otherwise, V_{PP_2V5} must be connected to a power supply with a minimum 2.30 V level.

Power Supply Ramp Rates[1, 2]

Symbol	Parameter	Min.	Max.	Units
t_{RAMP}	Power supply ramp rates for all power supplies.	0.6	10	V/ms

1. Assumes monotonic ramp rates.
2. Power up sequence must be followed. Please refer to Power-Up Supply Sequencing section.

Power-On Reset

All iCE40 Ultra devices have on-chip Power-On-Reset (POR) circuitry to ensure proper initialization of the device. Only three supply rails are monitored by the POR circuitry as follows: (1) V_{CC}, (2) SPI_V_{CCIO1} and (3) V_{PP_2V5}. All other supply pins have no effect on the power-on reset feature of the device. Note that all supply voltage pins must be connected to power supplies for normal operation (including device configuration).

Power-Up Supply Sequencing

It is recommended to bring up the power supplies in the following order. Note that there is no specified timing delay between the power supplies, however, there is a requirement for each supply to reach a level of 0.5V, or higher, before any subsequent power supplies in the sequence are applied.

1. **V_{CC}** and **V_{CCPLL}** should be the first two supplies to be applied. Note that these two supplies can be tied together subject to the recommendation to include a RC-based noise filter on the V_{CCPLL} (Please refer to TN1252, iCE40 Hardware Checklist.)

2. **SPI_V_{CCIO1}** should be the next supply, and can be applied any time after the previous supplies (V_{CC} and V_{CCPLL}) have reached as level of 0.5 V or higher.

3. **V_{PP_2V5}** should be the next supply, and can be applied any time after previous supplies (V_{CC}, V_{CCPLL} and SPI_V_{CCIO1}) have reached a level of 0.5 V or higher.

4. **Other Supplies** (V_{CCIO0} and V_{CCIO2}) do not affect device power-up functionality, and they can be applied any time after the initial power supplies (V_{CC} and V_{CCPLL}) have reached a level of 0.5 V or greater.

There is no power down sequence required. However, when partial power supplies are powered down, it is required the above sequence to be followed when these supplies are repowered up again.

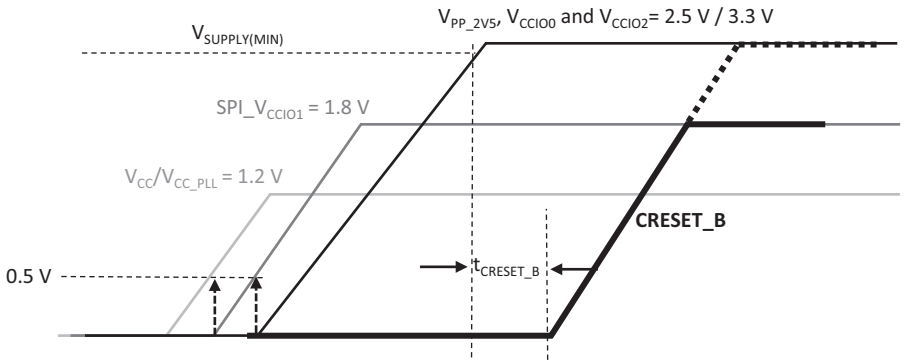
External Reset

When all power supplies have reached to their minimum operating voltage defined in Minimum Operation Condition Table, it is required to either keep CRESET_B LOW, or toggle CRESET_B from HIGH to LOW, for a duration of t_{CRESET_B}, and release it to go HIGH, to start configuration download from either the internal NVCM or the external Flash memory.

Figure 3-1 shows Power-Up sequence when SPI_V_{CCIO1} and V_{PP_2V5} are connected separately, and the CRESET_B signal triggers configuration download. Figure 3-2 shows when SPI_V_{CCIO1} and V_{PP_2V5} connected together.

All power supplies should be powered up during configuration. Before and during configuration, the I/Os are held in tri-state. I/Os are released to user functionality once the device has finished configuration.

Figure 3-1. Power Up Sequence with SPI_V_{CCIO1} and V_{PP_2V5} Not Connected Together



Supply Current [1, 2, 3, 4, 5]

Symbol	Parameter	Typ. V_{CC} = 1.2 V[4]	Units
$I_{CCSTDBY}$	Core Power Supply Static Current	71	µA
$I_{PP2V5STDBY}$	V_{PP_2V5} Power Supply Static Current	0.55	µA
$I_{SPI\_VCCIO1STDBY}$	SPI_V_{CCIO1} Power Supply Static Current	0.5	µA
$I_{CCIOSTDBY}$	V_{CCIO} Power Supply Static Current	0.5	µA
I_{CCPEAK}	Core Power Supply Startup Peak Current	8.0	mA
$I_{PP\_2V5PEAK}$	V_{PP_2V5} Power Supply Startup Peak Current	7.0	mA
$I_{SPI\_VCCIO1PEAK}$	SPI_V_{CCIO1} Power Supply Startup Peak Current	9.0	mA
$I_{CCIOPEAK}$	V_{CCIO} Power Supply Startup Peak Current	7.5	mA

1. Assumes blank pattern with the following characteristics: all outputs are tri-stated, all inputs are configured as LVCMOS and held at V_{CCIO} or GND, on-chip PLL is off. For more detail with your specific design, use the Power Calculator tool. Power specified with master SPI configuration mode. Other modes may be up to 25% higher.
2. Frequency = 0 MHz.
3. TJ = 25 °C, power supplies at nominal voltage, on devices processed in nominal process conditions.
4. Does not include pull-up.
5. Startup Peak Currents are measured with decoupling capacitance of 0.1 uF, 10 nF, and 1 nF to the power supply. Higher decoupling capacitance causes higher current.

User I^2C Specifications

Parameter Symbol	Parameter Description	spec (STD Mode)			spec (FAST Mode)			Units
		Min	Typ	Max	Min	Typ	Max	
f_{SCL}	Maximum SCL clock frequency	—	—	100	—	—	400	kHz
t_{HI}	SCL clock HIGH Time	4	—	—	0.6	—	—	µs
t_{LO}	SCL clock LOW Time	4.7	—	—	1.3	—	—	µs
$t_{SU,DAT}$	Setup time (DATA)	250	—	—	100	—	—	ns
$t_{HD,DAT}$	Hold time (DATA)	0	—	—	0	—	—	ns
$t_{SU,STA}$	Setup time (START condition)	4.7	—	—	0.6	—	—	µs
$t_{HD,STA}$	Hold time (START condition)	4	—	—	0.6	—	—	µs
$t_{SU,STO}$	Setup time (STOP condition)	4	—	—	0.6	—	—	µs
t_{BUF}	Bus free time between STOP and START	4.7	—	—	1.3	—	—	µs
$t_{CO,DAT}$	SCL LOW to DATAOUT valid	—	—	3.4	—	—	0.9	µs

User SPI Specifications[1, 2]

Parameter Symbol	Parameter Description	Min	Typ	Max	Units
f_{MAX}	Maximum SCK clock frequency	—	—	45	MHz

1. All setup and hold time parameters on external SPI interface are design-specific and, therefore, generated by the Lattice Design Software tools. These parameters include the following:
   - — $t_{SUmaster}$ master Setup time (master mode)
   - — $t_{HOLDmaster}$ master Hold time (master mode)
   - — $t_{SUslave}$ slave Setup time (slave mode)
   - — $t_{HOLDslave}$ slave Hold time (slave mode)
   - — $t_{SCK2OUT}$ SCK to out (slave mode)
2. The SCLK duty cycle needs to be specified in the Lattice Design Software as a timing constraint in order to ensure proper timing check on SCLK HIGH and LOW (t_{HI}, t_{LO}) time.

Typical Building Block Function Performance[1, 2]

Pin-to-Pin Performance (LVCMOS25)

Function	Timing	Units
Basic Functions		
16-bit decoder	16.5	ns
4:1 MUX	18.0	ns
16:1 MUX	19.5	ns

Register-to-Register Performance

Function	Timing	Units
Basic Functions		
16:1 MUX	110	MHz
16-bit adder	100	MHz
16-bit counter	100	MHz
64-bit counter	40	MHz
Embedded Memory Functions		
256x16 Pseudo-Dual Port RAM	150	MHz

1. The above timing numbers are generated using the Lattice Design Software tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device.
2. Under worst case operating conditions.

Derating Logic Timing

Logic timing provided in the following sections of the data sheet and the Lattice design tools are worst case numbers in the operating range. Actual delays may be much faster. Lattice design tools can provide logic timing numbers at a particular temperature and voltage.

Maximum sysIO Buffer Performance[1]

I/O Standard	Max. Speed	Units
Inputs		
LVCMOS33	250	MHz
LVCMOS25	250	MHz
LVCMOS18	250	MHz
Outputs		
LVCMOS33	250	MHz
LVCMOS25	250	MHz
LVCMOS18	155	MHz

1. Measured with a toggling pattern

iCE40 Ultra Family Timing Adders

Over Recommended Commercial Operating Conditions[1, 2, 3]

Buffer Type	Description	Timing (Typ.)	Units
Input Adjusters			
LVCMOS33	LVCMOS, V_{CCIO} = 3.3 V	0.18	ns
LVCMOS25	LVCMOS, V_{CCIO} = 2.5 V	0	ns
LVCMOS18	LVCMOS, V_{CCIO} = 1.8 V	0.19	ns
Output Adjusters			
LVCMOS33	LVCMOS, V_{CCIO} = 3.3 V	–0.12	ns
LVCMOS25	LVCMOS, V_{CCIO} = 2.5 V	0	ns
LVCMOS18	LVCMOS, V_{CCIO} = 1.8 V	1.32	ns

1. Timing adders are relative to LVCMOS25 and characterized but not tested on every device.
2. LVCMOS timing measured with the load specified in Switching Test Condition table.
3. Commercial timing numbers are shown.

iCE40 Ultra External Switching Characteristics

Over Recommended Commercial Operating Conditions

Parameter	Description	Device	Min	Max	Units
Clocks					
Global Clocks					
f_{MAX_GBUF}	Frequency for Global Buffer Clock network	All devices	—	185	MHz
t_{W_GBUF}	Clock Pulse Width for Global Buffer	All devices	2	—	ns
t_{SKEW_GBUF}	Global Buffer Clock Skew Within a Device	All devices	—	500	ps
Pin-LUT-Pin Propagation Delay					
t_{PD}	Best case propagation delay through one LUT logic	All devices	—	9.0	ns
General I/O Pin Parameters (Using Global Buffer Clock without PLL)[1]					
t_{SKEW_IO}	Data bus skew across a bank of IOs	All devices	—	410	ps
t_{CO}	Clock to Output – PIO Output Register	All devices	—	9.0	ns
t_{SU}	Clock to Data Setup – PIO Input Register	All devices	–0.5	—	ns
t_{H}	Clock to Data Hold – PIO Input Register	All devices	5.55	—	ns
General I/O Pin Parameters (Using Global Buffer Clock with PLL)					
t_{COPLL}	Clock to Output – PIO Output Register	All Devices	—	2.9	ns
t_{SUPLL}	Clock to Data Setup – PIO Input Register	All Devices	5.9	—	ns
t_{HPLL}	Clock to Data Hold – PIO Input Register	All Devices	–0.6	—	ns

1. All the data is from the worst case condition.

sysCLOCK PLL Timing

Over Recommended Operating Conditions

Parameter	Descriptions	Conditions	Min.	Max.	Units
f_{IN}	Input Clock Frequency (REFERENCECLK, EXTFEEDBACK)		10	133	MHz
f_{OUT}	Output Clock Frequency (PLLOUT)		16	275	MHz
f_{VCO}	PLL VCO Frequency		533	1066	MHz
f_{PFD}	Phase Detector Input Frequency		10	133	MHz
AC Characteristics					
t_{DT}	Output Clock Duty Cycle		40	60	%
t_{PH}	Output Phase Accuracy		—	+/–12	deg
t_{OPJIT}[1, 5, 6]	Output Clock Period Jitter	f_{OUT} >= 100 MHz	—	450	ps p-p
		f_{OUT} < 100 MHz	—	0.05	UIPP
	Output Clock Cycle-to-cycle Jitter	f_{OUT} >= 100 MHz	—	750	ps p-p
		f_{OUT} < 100 MHz	—	0.10	UIPP
	Output Clock Phase Jitter	f_{PFD} >= 25 MHz	—	275	ps p-p
		f_{PFD} < 25 MHz	—	0.05	UIPP
t_W	Output Clock Pulse Width	At 90% or 10%	1.33	—	ns
t_{LOCK}[2, 3]	PLL Lock-in Time		—	50	µs
t_{UNLOCK}	PLL Unlock Time		—	50	ns
t_{IPJIT}[4]	Input Clock Period Jitter	$f_{PFD} \geq 20$ MHz	—	1000	ps p-p
		f_{PFD} < 20 MHz	—	0.02	UIPP
t_{STABLE}[3]	LATCHINPUTVALUE LOW to PLL Stable		—	500	ns
t_{STABLE_PW}[3]	LATCHINPUTVALUE Pulse Width		100	—	ns
t_{RST}	RESET Pulse Width		10	—	ns
t_{RSTREC}	RESET Recovery Time		10	—	µs
$t_{DYNAMIC\_WD}$	DYNAMICDELAY Pulse Width		100	—	VCO Cycles

1. Period jitter sample is taken over 10,000 samples of the primary PLL output with a clean reference clock. Cycle-to-cycle jitter is taken over 1000 cycles. Phase jitter is taken over 2000 cycles. All values per JESD65B.
2. Output clock is valid after t_{LOCK} for PLL reset and dynamic delay adjustment.
3. At minimum f_{PFD}. As the f_{PFD} increases the time will decrease to approximately 60% the value listed.
4. Maximum limit to prevent PLL unlock from occurring. Does not imply the PLL will operate within the output specifications listed in this table.
5. The jitter values will increase with loading of the PLD fabric and in the presence of SSO noise.

sysDSP Timing

Over Recommended Operating Conditions

Parameter	Description	Min.	Max.	Units
$f_{MAX8x8SMULT}$	Max frequency signed MULT8x8 bypassing pipeline register	50	—	MHz
$f_{MAX16x16SMULT}$	Max frequency signed MULT16x16 bypassing pipeline register	50	—	MHz

SPI Master or NVCM Configuration Time[1, 2]

Symbol	Parameter	Conditions	Max.	Units
t_{CONFIG}	POR/CRESET_B to Device I/O Active	All devices – Low Frequency (Default)	95	ms
		All devices – Medium frequency	35	ms
		All devices – High frequency	18	ms

1. Assumes sysMEM Block is initialized to an all zero pattern if they are used.
2. The NVCM download time is measured with a fast ramp rate starting from the maximum voltage of POR trip point.

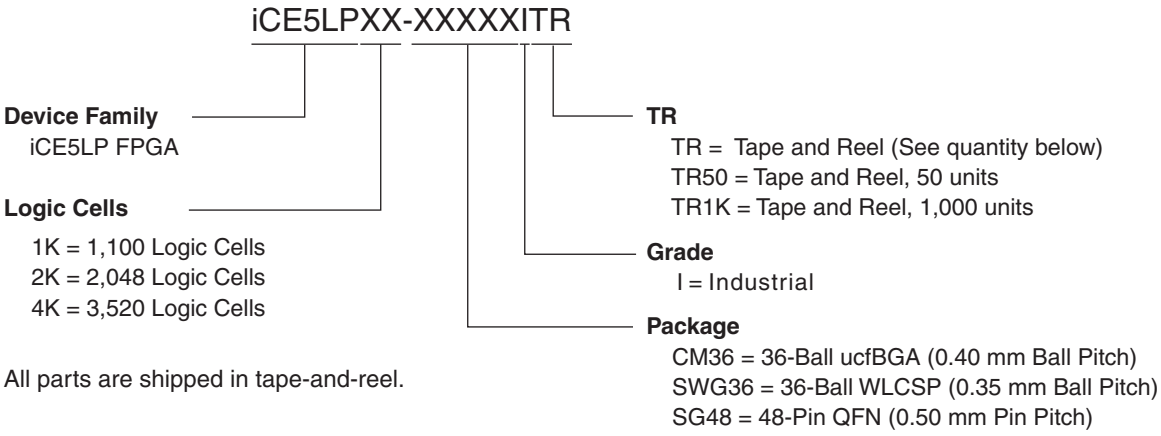
sysCONFIG Port Timing Specifications

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
All Configuration Modes						
t_{CRESET_B}	Minimum CRESET_B LOW pulse width required to restart configuration, from falling edge to rising edge		200	—	—	ns
t_{DONE_IO}	Number of configuration clock cycles after CDONE goes HIGH before the PIO pins are activated		49	—	—	Clock Cycles
Slave SPI						
t_{CR_SCK}	Minimum time from a rising edge on CRESET_B until the first SPI WRITE operation, first SPI_XCK clock. During this time, the iCE40 Ultra device is clearing its internal configuration memory		1200	—	—	µs
f_{MAX}	CCLK clock frequency	Write	1	—	25	MHz
		Read[1]	—	15	—	MHz
t_{CCLKH}	CCLK clock pulsewidth HIGH		20	—	—	ns
t_{CCLKL}	CCLK clock pulsewidth LOW		20	—	—	ns
t_{STSU}	CCLK setup time		12	—	—	ns
t_{STH}	CCLK hold time		12	—	—	ns
t_{STCO}	CCLK falling edge to valid output		13	—	—	ns
Master SPI[3]						
f_{MCLK}	MCLK clock frequency	Low Frequency (Default)	7.0	12.0	17.0	MHz
		Medium Frequency[2]	21.0	33.0	45.0	MHz
		High Frequency[2]	33.0	53.0	71.0	MHz
t_{MCLK}	CRESET_B HIGH to first MCLK edge		1200	—	—	µs
t_{SU}	CCLK setup time[4]		9.9	—	—	ns
t_{HD}	CCLK hold time		1	—	—	ns

1. Supported with 1.2 V Vcc and at 25 °C.
2. Extended range fMAX Write operations support up to 53 MHz with 1.2 V Vcc and at 25 °C.
3. t_{SU} and t_{HD} timing must be met for all MCLK frequency choices.
4. For considerations of SPI Master Configuration Mode, please refer to TN1248, iCE40 Programming and Configuration.

iCE40 Ultra Family Data Sheet Ordering Information

iCE5LP Part Number Description



All parts are shipped in tape-and-reel.

Tape and Reel Quantity

Package	TR Quantity
CM36	4,000
SWG36	5,000
SG48	2,000

Ordering Part Numbers

Industrial

Part Number	LUTs	Supply Voltage	Package	Pins	Temp.
iCE5LP1K-CM36ITR	1100	1.2 V	Halogen-Free ucfBGA	36	IND

iCE40 Ultra Family Data Sheet Revision History

June 2016 **Data Sheet DS1048**

Date	Version	Section	Change Summary
June 2016	2.0	Introduction	Updated General Description section. Changed “high current driver” to “high current IR driver”.
			Updated Features section. In Table 1-1, iCE40 Ultra Family Selection Guide, corrected HF Oscillator (48 kHz) to (48 MHz).
		Architecture	Updated Architecture Overview section. — Changed content to “The Programmable Logic Blocks (PLB) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each column has either PLB or EBR blocks." — Changed “high current LED sink” to "high current RGB and IR LED sinks".
			Updated sysCLOCK Phase Locked Loops (PLLs) section. Corrected V_{CCPLL} character format in Figure 2-3, PLL Diagram.
			Updated sysMEM Embedded Block RAM Memory section. Updated footnote in Table 2-4, sysMEM Block Configurations.
			Updated sysIO Buffer Banks section. — Changed statement to “The configuration SPI interface signals are powered by SPI_V_{CCIO1}.” — Corrected V_{CCIO} character format in Figure 2-8, I/O Bank and Programmable I/O Cell.
			Updated Typical I/O Behavior During Power-up section. Modified text content.
			Updated Supported Standards section. Changed statement to “The iCE40 Ultra sysIO buffer supports both single-ended input/output standards, and used as differential comparators.”
			Updated On-Chip Oscillator section. Changed statement to “The high frequency oscillator (HFOSC) runs at a nominal frequency of 48 MHz, divisible to 24 MHz, 12 MHz, or 6 MHz by user option.”
			Updated section heading to High Current LED Drive I/O Pins. Changed “high current drive” to “high current LED drive”.
			Removed Power On Reset section.
		DC and Switching Characteristics	Updated Absolute Maximum Ratings section. — Corrected symbol character format.
			Updated Recommended Operating Conditions section. — Corrected symbol character format. — Revised footnote 1. — Added footnote 4.
			Updated Power Supply Ramp Rates section. Changed t_{RAMP} Max. value.
			Added Power-On Reset section.
			Updated section heading to Power-Up Supply Sequencing. Revised text content.
			Added External Reset section.
			Updated DC Electrical Characteristics section. Revised footnote 4.

Date	Version	Section	Change Summary
June 2014	1.2	All	Product name changed to iCE40 Ultra.
		Introduction	Updated Table 1-1, iCE40 Ultra Family Selection Guide. Removed 30-ball WLCSP.
		DC and Switching Characteristics	Updated values in the following sections: — Supply Current — Internal Oscillators (HFOSC, LFOSC) — Power Supply Ramp Rates — Power-On-Reset Voltage Levels — SPI Master or NVCM Configuration Time
			Indicated TBD for values to be determined.
		Pinout Information	Updated Signal Descriptions section. Removed 30-pin WLCSP.
			Updated Pin Information Summary section. Removed SWG30 values.
		Ordering Information	Updated iCE5LP Part Number Description section. Removed 30-ball WLCSP.
			Updated Ordering Part Numbers section. Removed SWG30 and UWG30 part numbers.
May 2014	01.1	Introduction	Updated General Description, Features, and Introduction sections. Removed hardened RGB PWM IP information.
		Architecture	Updated Architecture Overview section. Removed the RGB IP block in Figure 2-1, iCE5LP-4K Device, Top View, Figure 2-8, I/O Bank and Programmable I/O, and in the text content.
			Updated High Current Drive I/O Pins section. Removed hardened RGB PWM IP information.
			Updated Power On Reset section. Removed content on Vccio_2 power down option.
			Replaced RGB PWM Block section with Embedded PWM IP section.
		DC and Switching Characteristics	Removed RGB PWM Block Timing section.
April 2014	01.0	All	Initial release.
