Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

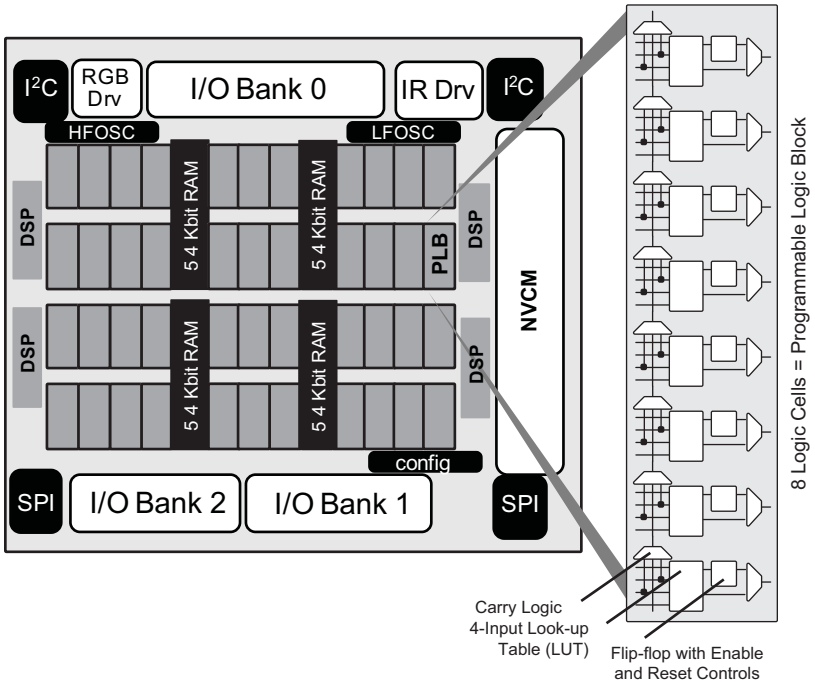
iCE40 Ultra Family Data Sheet Architecture

June 2016 Data Sheet DS1048

Architecture Overview

The iCE40 Ultra family architecture contains an array of Programmable Logic Blocks (PLB), two Oscillator Generators, two user configurable I²C controllers, two user configurable SPI controllers, and blocks of sysMEM™ Embedded Block RAM (EBR) surrounded by Programmable I/O (PIO). Figure 2-1shows the block diagram of the iCE5LP-4K device.

Figure 2-1. iCE5LP-4K Device, Top View



The Programmable Logic Blocks (PLB) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each column has either PLB or EBR blocks. The PIO cells are located at the top and bottom of the device, arranged in banks. The PLB contains the building blocks for logic, arithmetic, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

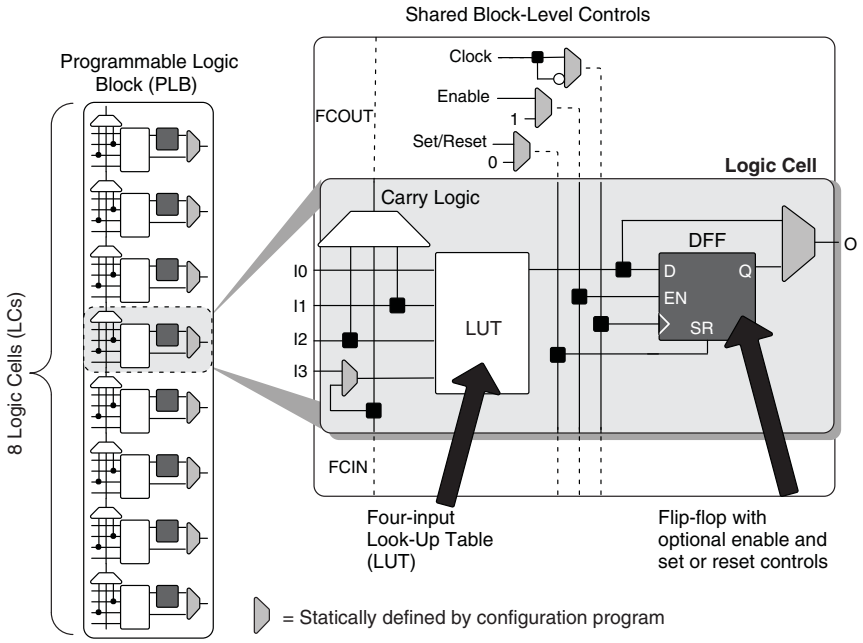
In the iCE40 Ultra family, there are three sysIO banks, one on top and two at the bottom. User can connect some V_{CCIO}s together, if all the I/Os are using the same voltage standard. Refer to the details in later sections of this document on Power Up Sequence. The sysMEM EBRs are large 4 kbit, dedicated fast memory blocks. These blocks can be configured as RAM, ROM or FIFO with user logic using PLBs.

Every device in the family has two user SPI ports, one of these (right side) SPI port also supports programming and configuration of the device. The iCE40 Ultra also includes two user I²C ports, two Oscillators, and high current RGB and IR LED sinks.

PLB Blocks

The core of the iCE40 Ultra device consists of Programmable Logic Blocks (PLB) which can be programmed to perform logic and arithmetic functions. Each PLB consists of eight interconnected Logic Cells (LC) as shown in Figure 2-2. Each LC contains one LUT and one register.

Figure 2-2. PLB Block Diagram



Logic Cells

Each Logic Cell includes three primary logic elements shown in Figure 2-2.

- A four-input Look-Up Table (LUT) builds any combinational logic function, of any complexity, requiring up to four inputs. Similarly, the LUT element behaves as a 16x1 Read-Only Memory (ROM). Combine and cascade multiple LUTs to create wider logic functions.
- A 'D'-style Flip-Flop (DFF), with an optional clock-enable and reset control input, builds sequential logic functions. Each DFF also connects to a global reset signal that is automatically asserted immediately following device configuration.
- Carry Logic boosts the logic efficiency and performance of arithmetic functions, including adders, subtracters, comparators, binary counters and some wide, cascaded logic functions.

Table 2-1. Logic Cell Signal Descriptions

Function	Type	Signal Names	Description
Input	Data signal	I0, I1, I2, I3	Inputs to LUT
Input	Control signal	Enable	Clock enable shared by all LCs in the PLB
Input	Control signal	Set/Reset[1]	Asynchronous or synchronous local set/reset shared by all LCs in the PLB.
Input	Control signal	Clock	Clock one of the eight Global Buffers, or from the general-purpose interconnects fabric shared by all LCs in the PLB
Input	Inter-PLB signal	FCIN	Fast carry in
Output	Data signals	O	LUT or registered output
Output	Inter-PFU signal	FCOUT	Fast carry out

1. If Set/Reset is not used, then the flip-flop is never set/reset, except when cleared immediately after configuration.

sysCLOCK Phase Locked Loops (PLLs)

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. The iCE40 Ultra devices have one sysCLOCK PLL. REFERENCECLK is the reference frequency input to the PLL and its source can come from an external I/O pin, the internal Oscillator Generators from internal routing. EXTFEEDBACK is the feedback signal to the PLL which can come from internal routing or an external I/O pin. The feedback divider is used to multiply the reference frequency and thus synthesize a higher frequency clock output.

The PLLOUT output has an output divider, thus allowing the PLL to generate different frequencies for each output. The output divider can have a value from 1 to 64 (in increments of 2X). The PLLOUT outputs can all be used to drive the iCE40 Ultra global clock network directly or general purpose routing resources can be used.

The LOCK signal is asserted when the PLL determines it has achieved lock and de-asserted if a loss of lock is detected. A block diagram of the PLL is shown in Figure 2-3.

The timing of the device registers can be optimized by programming a phase shift into the PLLOUT output clock which will advance or delay the output clock with reference to the REFERENCECLK clock. This phase shift can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after a phase adjustment on the output used as the feedback source and not relock until the tLOCK parameter has been satisfied.

There is an additional feature in the iCE40 Ultra PLL. There are 2 FPGA controlled inputs, SCLK and SDI, that allows the user logic to serially shift in data thru SDI, clocked by SCLK clock. The data shifted in would change the configuration settings of the PLL. This feature allows the PLL to be time multiplexed for different functions, with different clock rates. After the data is shifted in, user would simply pulse the RESET input of the PLL block, and the PLL will re-lock with the new settings. For more details, please refer to TN1251, iCE40 sysCLOCK PLL Design and Usage Guide.

Figure 2-3. PLL Diagram

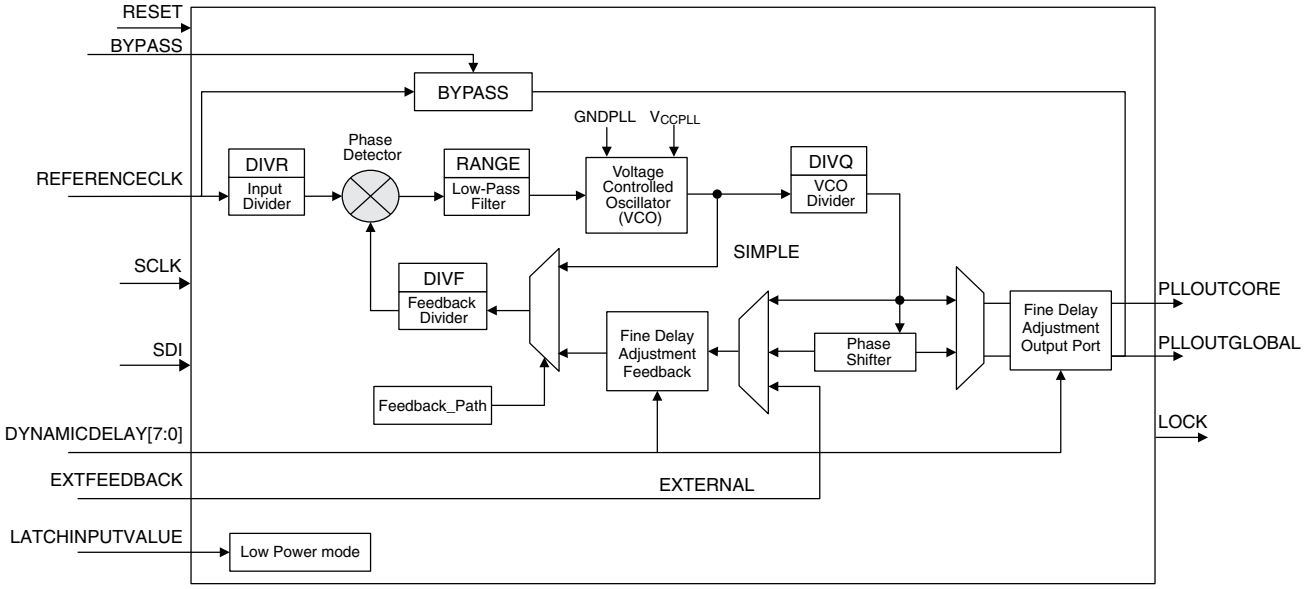


Table 2-3 provides signal descriptions of the PLL block.

Table 2-3. PLL Signal Descriptions

Signal Name	Direction	Description
REFERENCECLK	Input	Input reference clock
BYPASS	Input	The BYPASS control selects which clock signal connects to the PLL-OUT output. 0 = PLL generated signal 1 = REFERENCECLK
EXTFEEDBACK	Input	External feedback input to PLL. Enabled when the FEEDBACK_PATH attribute is set to EXTERNAL.
DYNAMICDELAY[7:0]	Input	Fine delay adjustment control inputs. Enabled when DELAY_ADJUSTMENT_MODE is set to DYNAMIC.
LATCHINPUTVALUE	Input	When enabled, puts the PLL into low-power mode; PLL output is held static at the last input clock value. Set ENABLE ICEGATE_PORTA and PORTB to '1' to enable.
PLLOUTGLOBAL	Output	Output from the Phase-Locked Loop (PLL). Drives a global clock network on the FPGA. The port has optimal connections to global clock buffers GBUF4 and GBUF5.
PLLOUTCORE	Output	Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBAL port.
LOCK	Output	When High, indicates that the PLL output is phase aligned or locked to the input reference clock.
RESET	Input	Active low reset.
SCLK	Input	Input, Serial Clock used for re-programming PLL settings.
SDI	Input	Input, Serial Data used for re-programming PLL settings.

sysMEM Embedded Block RAM Memory

Larger iCE40 Ultra device includes multiple high-speed synchronous sysMEM Embedded Block RAMs (EBRs), each 4 kbit in size. This memory can be used for a wide variety of purposes including data buffering, and FIFO.

sysMEM Memory Block

The sysMEM block can implement single port, pseudo dual port, or FIFO memories with programmable logic resources. Each block can be used in a variety of depths and widths as shown in Table 2-4.

sysDSP

The iCE40 Ultra family provides an efficient sysDSP architecture that is very suitable for low-cost Digital Signal Processing (DSP) functions for mobile applications. Typical functions used in these applications are Multiply, Accumulate, and Multiply-Accumulate. The block can also be used for simple Add and Subtract functions.

iCE40 Ultra sysDSP Architecture Features

The iCE40 Ultra sysDSP supports many functions that include the following:

- Single 16-bit x 16-bit Multiplier, or two independent 8-bit x 8-bit Multipliers
- Optional independent pipeline control on Input Register, Output Register, and Intermediate Reg faster clock performance
- Single 32-bit Accumulator, or two independent 16-bit Accumulators
- Single 32-bit, or two independent 16-bit Adder/Subtracter functions, registered or asynchronous
- Cascadable to create wider Accumulator blocks

Figure 2-5 shows the block diagram of the sysDSP block. The block consists Multiplier section, with an bypassable Output register. The Input Register, Intermediate register between Multiplier and AC timing to achieve the highest performance.

sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in groups referred to as banks. The sysIO buffers allow users to implement a wide variety of standards that are found in today's systems with LVCMOS interfaces.

User I²C IP

The iCE40 Ultra devices have two I²C IP cores. Either of the two cores can be configured either as an I²C master or as an I²C slave. The pins for the I²C interface are not pre-assigned. User can use any General Purpose I/O pins.

In each of the two cores, there are options to delay the either the input or the output, or both, by 50 ns nominal, using dedicated on-chip delay elements. This provides an easier interface with any external I²C components.

When the IP core is configured as master, it will be able to control other devices on the I²C bus through the pre-assigned pin interface. When the core is configured as the slave, the device will be able to provide I/O expansion to an I²C Master. The I²C cores support the following functionality:

- Master and Slave operation
- 7-bit and 10-bit addressing
- Multi-master arbitration support
- Clock stretching
- Up to 400 kHz data transfer speed
- General Call support
- Optionally delaying input or output data, or both

For further information on the User I²C, please refer to TN1274, iCE40 SPI/I2C Hardened IP Usage Guide.

User SPI IP

The iCE40 Ultra devices have two SPI IP cores. The pins for the SPI interface are not pre-assigned. User can use any General Purpose I/O pins. Both SPI IP cores can be configured as a SPI master or as a slave. When the SPI IP core is configured as a master, it controls the other SPI enabled devices connected to the SPI Bus. When SPI IP core is configured as a slave, the device will be able to interface to an external SPI master.

The SPI IP core supports the following functions:

- Configurable Master and Slave modes
- Full-Duplex data transfer
- Mode fault error flag with CPU interrupt capability
- Double-buffered data register
- Serial clock with programmable polarity and phase
- LSB First or MSB First Data Transfer

For further information on the User SPI, please refer to TN1274, iCE40 SPI/I2C Hardened IP Usage Guide.

High Current LED Drive I/O Pins

The iCE40 Ultra family devices offer multiple high current LED drive outputs in each device in the family to allow the iCE40 Ultra product to drive LED signals directly on mobile applications.

There are three outputs on each device that can sink up to 24 mA current. These outputs are open-drain outputs, and provides sinking current to an LED connecting to the positive supply. These three outputs are designed to drive the RBG LEDs, such as the service LED found in a lot of mobile devices. An embedded RGB PWM IP is also offered in the family. This RGB drive current is user programmable from 4 mA to 24 mA, in increments of 4 mA. This output functions as General Purpose I/O with open-drain when the high current LED drive is not needed.

Absolute Maximum Ratings[1, 2, 3]

Supply Voltage V_{CC} . . . . . –0.5 V to 1.42 V

Output Supply Voltage V_{CCIO} . . . . . –0.5 V to 3.60 V

NVCM Supply Voltage V_{PP_2V5} . . . . . –0.5 V to 3.60 V

PLL Supply Voltage V_{CCPLL} . . . . . –0.5 V to 1.42 V

I/O Tri-state Voltage Applied. . . . . –0.5 V to 3.60 V

Dedicated Input Voltage Applied . . . . . –0.5 V to 3.60 V

Storage Temperature (Ambient). . . . . –65 °C to 150 °C

Junction Temperature (T_J) . . . . . –65 °C to 125 °C

1. Stress above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice Thermal Management document is required.
3. All voltages referenced to GND.

1. Like power supplies must be tied together if they are at the same supply voltage and they meet the power up sequence requirement. Please refer to Power-Up Supply Sequencing section. V_{CC} and V_{CCPLL} are recommended to tie to same supply with an RC-based noise filter between them. Please refer to TN1252, iCE40 Hardware Checklist.
2. See recommended voltages by I/O standard in subsequent table.
3. V_{CCIO} pins of unused I/O banks should be connected to the V_{CC} power supply on boards.
4. V_{PP_2V5} can, optionally, be connected to a 1.8 V (+/-5%) power supply in Slave SPI Configuration mode subject to the condition that none of the HFOSC/LFOSC and RGB LED / IR LED driver features are used. Otherwise, V_{PP_2V5} must be connected to a power supply with a minimum 2.30 V level.

Power Supply Ramp Rates[1, 2]

Symbol	Parameter	Min.	Max.	Units
t_{RAMP}	Power supply ramp rates for all power supplies.	0.6	10	V/ms

1. Assumes monotonic ramp rates.
2. Power up sequence must be followed. Please refer to Power-Up Supply Sequencing section.

t_{SU}	CCLK setup time[4]		9.9	—	—	ns
t_{HD}	CCLK hold time		1	—	—	ns

1. Supported with 1.2 V Vcc and at 25 °C.
2. Extended range fMAX Write operations support up to 53 MHz with 1.2 V Vcc and at 25 °C.
3. t_{SU} and t_{HD} timing must be met for all MCLK frequency choices.
4. For considerations of SPI Master Configuration Mode, please refer to TN1248, iCE40 Programming and Configuration.

Signal Descriptions

Signal Name		Function	I/O	Description
Power Supplies				
V_{CC}		Power	—	Core Power Supply
V_{CCIO_0}, SPI_V_{CCIO1}, V_{CCIO_2}		Power	—	Power for I/Os in Bank 0, 1 and 2.
V_{PP_2V5}		Power	—	Power for NVCM programming and operations.
V_{CCPLL}		Power	—	Power for PLL
GND		GROUND	—	Ground
GND_LED		GROUND	—	Ground for LED drivers. Should connect to GND on board.
Configuration				
CRESETB		Configuration	I	Configuration Reset, active LOW. No internal pull-up resistor. Either actively driven externally or connect an 10 kOhm pull-up to V_{CCIO_1}.
CDONE		Configuration	I/O	Configuration Done. Includes a weak pull-up resistor to SPI_V_{CCIO1}.
		General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function.
Config SPI				
Primary	Secondary			
CRESETB	—	Configuration	I	Configuration Reset, active LOW. No internal pull-up resistor. Either actively driven externally or connect an 10 kOhm pull-up to SPI_V_{CCIO1}.
PIOB_xx	CDONE	Configuration	I/O	Configuration Done. Includes a weak pull-up resistor to SPI_V_{CCIO1}.
		General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function.
Config SPI				
Primary	Secondary			
PIOB_34a	SPI_SCK	Configuration	I/O	This pin is shared with device configuration. During configuration: In Master SPI mode, this pin outputs the clock to external SPI memory. In Slave SPI mode, this pin inputs the clock from external processor.
		General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function
PIOB_32a	SPI_SDO	Configuration	Output	This pin is shared with device configuration. During configuration: In Master SPI mode, this pin outputs the command data to external SPI memory. In Slave SPI mode, this pin connects to the MISO pin of the external processor.
		General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function.

Signal Name	Function	I/O	Description
RGB2	General I/O	Open-Drain I/O	In user mode, with user's choice, this pin can be programmed as open drain I/O in user function
	LED	Open-Drain Output	In user mode, with user's choice, this pin can be programmed as open drain 24mA output to drive external LED
IRLED	General I/O	Open-Drain I/O	In user mode, with user's choice, this pin can be programmed as open drain I/O in user function
	LED	Open-Drain Output	In user mode, with user's choice, this pin can be programmed as open drain 500mA output to drive external LED
PIOT_xx	General I/O	I/O	In user mode, with user's choice, this pin can be programmed as I/O in user function in the top (xx = I/O location)
PIOB_xx	General I/O	I/O	In user mode, with user's choice, this pin can be programmed as I/O in user function in the bottom (xx = I/O location)

iCE40 Ultra Family Data Sheet Revision History

June 2016 **Data Sheet DS1048**

Date	Version	Section	Change Summary
June 2016	2.0	Introduction	Updated General Description section. Changed “high current driver” to “high current IR driver”.
			Updated Features section. In Table 1-1, iCE40 Ultra Family Selection Guide, corrected HF Oscillator (48 kHz) to (48 MHz).
		Architecture	Updated Architecture Overview section. — Changed content to “The Programmable Logic Blocks (PLB) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each column has either PLB or EBR blocks." — Changed “high current LED sink” to "high current RGB and IR LED sinks".
			Updated sysCLOCK Phase Locked Loops (PLLs) section. Corrected V_{CCPLL} character format in Figure 2-3, PLL Diagram.
			Updated sysMEM Embedded Block RAM Memory section. Updated footnote in Table 2-4, sysMEM Block Configurations.
			Updated sysIO Buffer Banks section. — Changed statement to “The configuration SPI interface signals are powered by SPI_V_{CCIO1}.” — Corrected V_{CCIO} character format in Figure 2-8, I/O Bank and Programmable I/O Cell.
			Updated Typical I/O Behavior During Power-up section. Modified text content.
			Updated Supported Standards section. Changed statement to “The iCE40 Ultra sysIO buffer supports both single-ended input/output standards, and used as differential comparators.”
			Updated On-Chip Oscillator section. Changed statement to “The high frequency oscillator (HFOSC) runs at a nominal frequency of 48 MHz, divisible to 24 MHz, 12 MHz, or 6 MHz by user option.”
			Updated section heading to High Current LED Drive I/O Pins. Changed “high current drive” to “high current LED drive”.
			Removed Power On Reset section.
		DC and Switching Characteristics	Updated Absolute Maximum Ratings section. — Corrected symbol character format.
			Updated Recommended Operating Conditions section. — Corrected symbol character format. — Revised footnote 1. — Added footnote 4.
			Updated Power Supply Ramp Rates section. Changed t_{RAMP} Max. value.
			Added Power-On Reset section.
			Updated section heading to Power-Up Supply Sequencing. Revised text content.
			Added External Reset section.
			Updated DC Electrical Characteristics section. Revised footnote 4.

Date	Version	Section	Change Summary
			Updated Supply Current section. — Corrected $I_{PP2V5STDBY}$ parameter. — Added Typ. VCC = 1.2 V values for I_{CCPEAK}, $I_{PP\_2V5PEAK}$, $I_{SPI\_VCCIO1PEAK}$, and $I_{CCIOPEAK}$. — Added footnote 5. — Corrected S_{PI_VCCIO1} character format.
			Updated User SPI Specifications section. Removed parameters and added footnotes.
			Updated Internal Oscillators (HFOSC, LFOSC) section. Added Commercial and Industrial Temp values for DCH_{CLKHF}.
			Updated sysIO Single-Ended DC Electrical Characteristics section. Removed footnote.
			Updated Register-to-Register Performance section. Modified footnotes.
			Updated iCE40 Ultra External Switching Characteristics section. Modified footnote.
			Updated sysCLOCK PLL Timing section. Reversed t_{OPJIT} conditions.
			Updated sysCONFIG Port Timing Specifications section. — Modified t_{CR_SCK} Min. value. — Added footnote 4 to t_{SU} parameter. — Modified t_{SU} Min. value. — Modified t_{HD} parameter.
			Updated section heading to RGB LED and IR LED Drive. Modified ILED_ACCURACY and IIR_ACCURACY parameters, Min. and Max. values.
		Pinout Information	Updated Signal Descriptions section. Changed V_{CCIO_1} to SPI_V_{CCIO1} in the CDONE, CRESETB and PIOB_xx descriptions.
			Updated Pin Information Summary section. — Corrected symbol character format. — Corrected VCPP_2V5 to V_{PP_2V5}.
	1.9	Introduction	Updated Features section. Updated BGA package to ucfBGA.
		DC and Switching Characteristics	Updated Differential Comparator Electrical Characteristics section. Corrected typo in V_{REF} Max. value.
		Pinout Information	Updated Signal Descriptions section. — Changed PIOB_12a to PIOB_xx — Changed SPI_CSN to SPI_SS_B and revised description when in Slave SPI mode. — Corrected minor typo errors.
			Updated Pin Information Summary section. Added footnote to SG48.
		Ordering Information	Updated iCE5LP Part Number Description section. Updated BGA package to ucfBGA.
			Updated Ordering Part Numbers section. Updated BGA package to ucfBGA.
June 2015	1.8	DC and Switching Characteristics	Updated Internal Oscillators (HFOSC, LFOSC) section. Removed decimals.
		Ordering Information	Updated iCE5LP Part Number Description section. — Added TR items. — Corrected formatting errors.
			Updated Ordering Part Numbers section. Updated CM36 and SG48 packages.

Date	Version	Section	Change Summary
August 2014	1.4	All	Removed Preliminary document status.
		Introduction	Updated General Description section. Added information on high current driver.
			Updated Features section. — Changed standby current typical to as low as 71 µA. — Changed feature to Embedded Memory. — Updated Table 1-1, iCE40 Ultra Family Selection Guide. Added NVCM and Embedded PWM IP rows. Added (MULT16 with 32-bit Accumulator) to DSP Block. Added Total I/O (Dedicated I/O) Count data.
			General update to Introduction section.
		Architecture	Updated Architecture Overview section. — Revised and added information on sysIO banks. — Updated reference for embedded PWM IP.
			Updated iCE40 Ultra Programming and Configuration section. — Changed SPI1 to SPI. — Changed VCCIO_1 to SPI_V_{CCIO1}.
		DC and Switching Characteristics	Updated Absolute Maximum Ratings section. Changed PLL Supply Voltage VCCPLL value.
			Updated Recommended Operating Conditions section. Added footnote to VCCPLL.
			Updated Power-up Sequence section. General update.
			Updated Power-On-Reset Voltage Levels section. Changed the V_{PORUP} V_{CC} Max.value.
			Updated DC Electrical Characteristics section. Added C_3 and C_4 information.
			Updated Supply Current section. — Completed Typ. VCC =1.2 V4 data. — Changed symbols to $I_{SPI\_VCCIO1STDBY}$ and $I_{SPI\_VCCIO1PEAK}$. — Added information to footnote 3.
			Updated Internal Oscillators (HFOSC, LFOSC) section. General update.
			Updated iCE40 Ultra External Switching Characteristics section. Added Max. value for t_{COPLL}. Added Min. values for t_{SUPLL} and t_{HPLL}.
			Updated sysCLOCK PLL Timing section. Added Max. value for t_{OPJIT}.
			Updated sysCONFIG Port Timing Specifications section. — Added T_{SU} and T_{HD} information. — Added footnote 3 to Master SPI.
			Updated High Current LED and IR LED Drive section. Updated Min. value.
July 2014	1.3	All	Changed document status from Advance to Preliminary.
		Introduction	Updated Features section. Adjusted Ultra-low Power Devices standby current.
		DC and Switching Characteristics	Updated AC/DC specifications numbers.

Date	Version	Section	Change Summary
June 2014	1.2	All	Product name changed to iCE40 Ultra.
		Introduction	Updated Table 1-1, iCE40 Ultra Family Selection Guide. Removed 30-ball WLCSP.
		DC and Switching Characteristics	Updated values in the following sections: — Supply Current — Internal Oscillators (HFOSC, LFOSC) — Power Supply Ramp Rates — Power-On-Reset Voltage Levels — SPI Master or NVCM Configuration Time
			Indicated TBD for values to be determined.
		Pinout Information	Updated Signal Descriptions section. Removed 30-pin WLCSP.
			Updated Pin Information Summary section. Removed SWG30 values.
		Ordering Information	Updated iCE5LP Part Number Description section. Removed 30-ball WLCSP.
			Updated Ordering Part Numbers section. Removed SWG30 and UWG30 part numbers.
May 2014	01.1	Introduction	Updated General Description, Features, and Introduction sections. Removed hardened RGB PWM IP information.
		Architecture	Updated Architecture Overview section. Removed the RGB IP block in Figure 2-1, iCE5LP-4K Device, Top View, Figure 2-8, I/O Bank and Programmable I/O, and in the text content.
			Updated High Current Drive I/O Pins section. Removed hardened RGB PWM IP information.
			Updated Power On Reset section. Removed content on Vccio_2 power down option.
			Replaced RGB PWM Block section with Embedded PWM IP section.
		DC and Switching Characteristics	Removed RGB PWM Block Timing section.
April 2014	01.0	All	Initial release.
