Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	147456
Number of I/O	300
Number of Gates	1000000
Voltage - Supply	1.14V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TJ)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a3p1000-2fgg484m

1 – Military ProASIC3/EL Device Family Overview

General Description

The military ProASIC3/EL family of flash FPGAs dramatically reduces dynamic power consumption by 40% and static power by 50%. These power savings are coupled with performance, density, true single chip, 1.2 V to 1.5 V core and I/O operation, reprogrammability, and advanced features.

Microsemi's proven Flash*Freeze technology enables military ProASIC3EL device users to shut off dynamic power instantaneously and switch the device to static mode without the need to switch off clocks or power supplies, and retaining internal states of the device. This greatly simplifies power management. In addition, optimized software tools using power-driven layout provide instant push-button power reduction.

Nonvolatile flash technology gives military ProASIC3/EL devices the advantage of being a secure, low-power, single-chip solution that is live at power-up (LAPU). Military ProASIC3/EL devices offer dramatic dynamic power savings, giving FPGA users flexibility to combine low power with high performance.

These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

Military ProASIC3/EL devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry (CCC) based on an integrated phase-locked loop (PLL). Military ProASIC3/EL devices support devices from 250K system gates to 3 million system gates with up to 504 kbits of true dual-port SRAM and 620 user I/Os.

M1 military ProASIC3/EL devices support the high-performance, 32-bit Cortex-M1 processor developed by ARM for implementation in FPGAs. ARM Cortex-M1 is a soft processor that is fully implemented in the FPGA fabric. It has a three-stage pipeline that offers a good balance between low-power consumption and speed when implemented in an M1 military ProASIC3/EL device. The processor runs the ARMv6-M instruction set, has a configurable nested interrupt controller, and can be implemented with or without the debug block. ARM Cortex-M1 is available at no cost from Microsemi for use in M1 military ProASIC3/EL FPGAs.

The ARM-enabled devices have ordering numbers that begin with M1 and do not support AES decryption.

Flash*Freeze Technology†

Military ProASIC3EL devices offer Flash*Freeze technology, which allows instantaneous switching from an active state to a static state. When Flash*Freeze mode is activated, military ProASIC3EL devices enter a static state while retaining the contents of registers and SRAM. Power is conserved without the need for additional external components to turn off I/Os or clocks. Flash*Freeze technology is combined with in-system programmability, which enables users to quickly and easily upgrade and update their designs in the final stages of manufacturing or in the field. The ability of military ProASIC3EL devices to support a 1.2 V core voltage allows for an even greater reduction in power consumption, which enables low total system power.

When the military ProASIC3EL device enters Flash*Freeze mode, the device automatically shuts off the clocks and inputs to the FPGA core; when the device exits Flash*Freeze mode, all activity resumes and data is retained.

The availability of low-power modes, combined with a reprogrammable, single-chip, single-voltage solution, make military ProASIC3EL devices suitable for low-power data transfer and manipulation in military-temperature applications where available power may be limited (e.g., in battery-powered equipment); or where heat dissipation may be limited (e.g., in enclosures with no forced cooling).

† *Flash*Freeze technology is not supported on A3P1000.*

User Nonvolatile FlashROM

Military ProASIC3/EL devices have 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications:

- Internet protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, set-top boxes)
- Secure key storage for secure communications algorithms
- Asset management/tracking
- Date stamping
- Version management

FlashROM is written using the standard military ProASIC3/EL IEEE 1532 JTAG programming interface. The core can be individually programmed (erased and written), and on-chip AES decryption can be used selectively to securely load data over public networks, as in security keys stored in the FlashROM for a user design.

FlashROM can be programmed via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing. Note that the FlashROM can only be programmed from the JTAG interface and cannot be programmed from the internal logic array.

FlashROM is programmed as 8 banks of 128 bits; however, reading is performed on a byte-by-byte basis using a synchronous interface. A 7-bit address from the FPGA core defines which of the 8 banks and which of the 16 bytes within that bank are being read. The three most significant bits (MSBs) of the FlashROM address determine the bank, and the four least significant bits (LSBs) of the FlashROM address define the byte.

Microsemi military ProASIC3/EL development software solutions, Libero SoC has extensive support for the FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using the Libero SoC software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

SRAM and FIFO

Military ProASIC3/EL devices have embedded SRAM blocks along their north and south sides. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro.

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal Empty and Full flags. The embedded FIFO control unit contains the counters necessary for generation of the read and write address pointers. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

PLL and CCC

Military ProASIC3 devices provide designers with flexible clock conditioning circuit (CCC) capabilities. Each member of the military ProASIC3 family contains six CCCs, located at the four corners and the centers of the east and west sides. One CCC (center west side) has a PLL. All six CCC blocks are usable; the four corner CCCs and the east CCC allow simple clock delay operations as well as clock spine access.

Military ProASIC3EL devices also contain six CCCs; however, all six are equipped with a PLL.

The inputs of the six CCC blocks are accessible from the FPGA core or from one of several inputs located near the CCC that have dedicated connections to the CCC block.

Table 2-2 • Recommended Operating Conditions [1]

Symbol	Parameter		Military	Units
T_J	Junction temperature		–55 to 125 [2]	°C
VCC	1.5 V DC core supply voltage[3]		1.425 to 1.575	V
	1.2 V – 1.5 V wide range DC core supply voltage [4]		1.14 to 1.575	V
VJTAG	JTAG DC voltage		1.4 to 3.6	V
VPUMP[5]	Programming voltage	Programming mode	3.15 to 3.45	V
		Operation[6]	0 to 3.6	V
VCCPLL[5]	Analog power supply (PLL)	1.5 V DC core supply voltage[3]	1.425 to 1.575	V
		1.2 V – 1.5 V DC core supply voltage[4]	1.14 to 1.575	V
VCCI and VMV[5]	1.2 V DC supply voltage[4]		1.14 to 1.26	V
	1.2 V wide range DC supply voltage[4]		1.14 to 1.575	V
	1.5 V DC supply voltage		1.425 to 1.575	V
	1.8 V DC supply voltage		1.7 to 1.9	V
	2.5 V DC supply voltage		2.3 to 2.7	V
	3.0 V DC supply voltage[7]		2.7 to 3.6	V
	3.3 V DC supply voltage		3.0 to 3.6	V
	LVDS differential I/O		2.375 to 2.625	V
	LVPECL differential I/O		3.0 to 3.6	V

Notes:

1. *All parameters representing voltages are measured with respect to GND unless otherwise specified.*
2. *Default Junction Temperature Range in the Libero SoC software is set from 0°C to +70°C for commercial, and -40°C to +85°C for industrial. To ensure targeted reliability standards are met across the full range of junction temperatures, Microsemi recommends using custom settings for temperature range before running timing and power analysis tools. For more information regarding custom settings, refer to the New Project Dialog Box in the Libero SoC Online Help.*
3. *For A3P250 and A3P1000*
4. *For A3PE600L and A3PE3000L devices only, operating at VCCI ≥ VCC.*
5. *See the "Pin Descriptions and Packaging" section on page 3-1 for instructions and recommendations on tie-off and supply grouping.*
6. *The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in Table 2-25 on page 2-22. VCCI should be at the same voltage within a given I/O bank.*
7. *3.3 V wide range is compliant to the JESD8-B specification and supports 3.0 V VCCI operation.*
8. *To ensure targeted reliability standards are met across ambient and junction operating temperatures, Microsemi recommends that the user follow best design practices using Microsemi's timing and power simulation tools.*

Power per I/O Pin

Table 2-14 • Summary of I/O Input Buffer Power (Per Pin) – Default I/O Software Settings Applicable to Pro I/Os for A3PE600L and A3PE3000L Only

	VCCI (V)	Static Power PDC6 (mW)[1]	Dynamic Power PAC9 (µW/MHz)[2]
Single-Ended			
3.3 V LVTTL/LVCMOS	3.3	–	16.34
3.3 V LVTTL/LVCMOS – Schmitt trigger	3.3	–	24.49
3.3 V LVCMOS Wide Range	3.3	–	16.34

t_{IWCLR}	Asynchronous Clear Minimum Pulse Width for the Input Data Register	0.25	0.30	ns
t_{IWPRE}	Asynchronous Preset Minimum Pulse Width for the Input Data Register	0.25	0.30	ns
$t_{ICKMPWH}$	Clock Minimum Pulse Width HIGH for the Input Data Register	0.41	0.48	ns
$t_{ICKMPWL}$	Clock Minimum Pulse Width LOW for the Input Data Register	0.37	0.43	ns

Note: For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-6 for derating values.

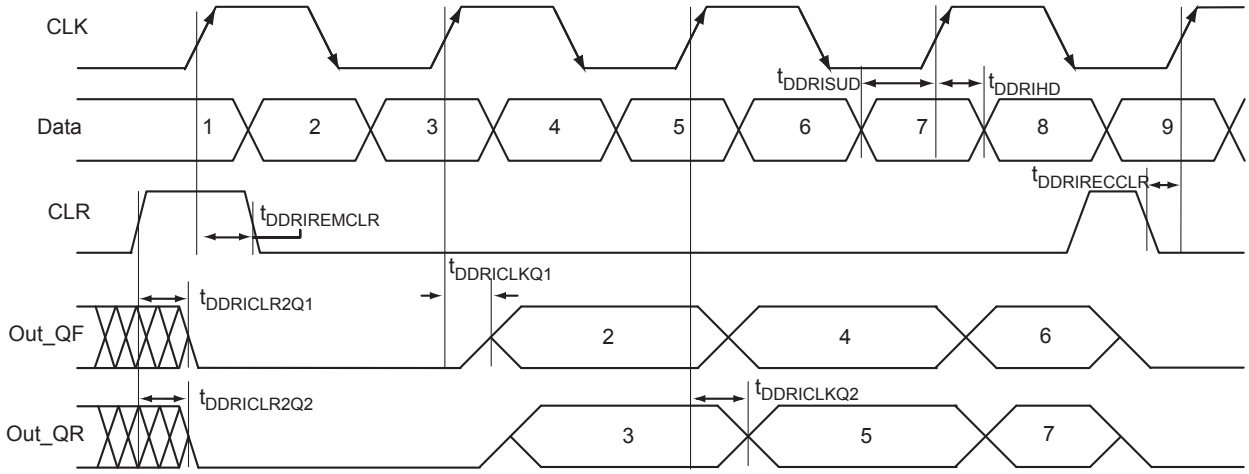

Figure 2-34 • **Input DDR Timing Diagram**

Timing Characteristics

Table 2-182 • **Input DDR Propagation Delays**
Military-Case Conditions: T_J = 125°C, Worst-Case VCC = 1.14 V for A3PE600L and A3PE3000L

Parameter	Description	–1	Std.	Units
$t_{DDRICLKQ1}$	Clock-to-Out Out_QR for Input DDR	0.38	0.45	ns
$t_{DDRICLKQ2}$	Clock-to-Out Out_QF for Input DDR	0.54	0.63	ns
$t_{DDRISUD1}$	Data Setup for Input DDR (fall)	0.39	0.46	ns
$t_{DDRISUD2}$	Data Setup for Input DDR (rise)	0.34	0.40	ns
$t_{DDRIHD1}$	Data Hold for Input DDR (fall)	0.00	0.00	ns
$t_{DDRIHD2}$	Data Hold for Input DDR (rise)	0.00	0.00	ns
$t_{DDRICLR2Q1}$	Asynchronous Clear-to-Out Out_QR for Input DDR	0.64	0.75	ns
$t_{DDRICLR2Q2}$	Asynchronous Clear-to-Out Out_QF for Input DDR	0.79	0.93	ns
$t_{DDRIREMCLR}$	Asynchronous Clear Removal Time for Input DDR	0.00	0.00	ns
$t_{DDRIRECCLR}$	Asynchronous Clear Recovery Time for Input DDR	0.31	0.36	ns
$t_{DDRIWCLR}$	Asynchronous Clear Minimum Pulse Width for Input DDR	0.19	0.22	ns
$t_{DDRICKMPWH}$	Clock Minimum Pulse Width HIGH for Input DDR	0.31	0.36	ns
$t_{DDRICKMPWL}$	Clock Minimum Pulse Width LOW for Input DDR	0.28	0.32	ns
$F_{DDRIMAX}$	Maximum Frequency for Input DDR	160	160	MHz

Note: For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.

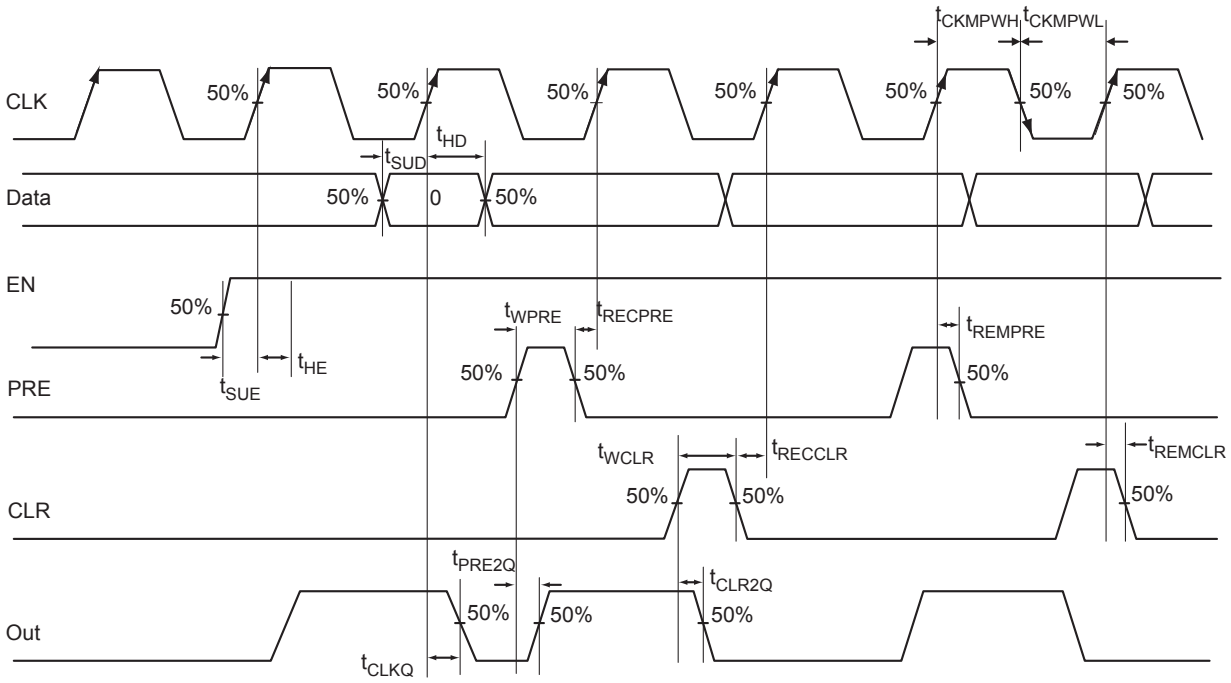

Figure 2-40 • **Timing Model and Waveforms**

Table 2-199 • A3P250 Global Resource
Military-Case Conditions: T_J = 125°C, VCC = 1.425 V

Parameter	Description	–1		Std.		Units
		Min.[1]	Max.[2]	Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	0.97	1.24	1.14	1.46	ns
t_{RCKH}	Input High Delay for Global Clock	0.94	1.27	1.11	1.49	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock					ns
t_{RCKSW}	Maximum Skew for Global Clock		0.32		0.38	ns
F_{RMAX}	Maximum Frequency for Global Clock					MHz

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-6 for derating values.*

Table 2-200 • A3P1000 Global Resource
Military-Case Conditions: T_J = 125°C, VCC = 1.425 V

Parameter	Description	–1		Std.		Units
		Min.[1]	Max.[2]	Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	1.18	1.44	1.39	1.70	ns
t_{RCKH}	Input High Delay for Global Clock	1.17	1.48	1.37	1.74	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock					ns
t_{RCKSW}	Maximum Skew for Global Clock		0.32		0.37	ns
F_{RMAX}	Maximum Frequency for Global Clock					MHz

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-6 for derating values.*

3 – Pin Descriptions and Packaging

Supply Pins

GND **Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

GNDQ **Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

VCC **Core Supply Voltage**

Supply voltage to the FPGA core, nominally 1.5 V for A3P250 and A3P100 devices and 1.2 V or 1.5 V for A3PE600L and A3PE3000L devices. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

For A3PE600L and A3PE3000L devices, VCC can be switched dynamically from 1.2 V to 1.5 V or vice versa. This allows in-system programming (ISP) when VCC is at 1.5 V and the benefit of low power operation when VCC is at 1.2 V.

VCCIBx **I/O Supply Voltage**

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to eight I/O banks on low power flash devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCIBx supply. VCCI can be 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VCCI pins tied to GND.

VMVx **I/O Supply Voltage (quiet)**

Quiet supply voltage to the input buffers of each I/O bank. *x* is the bank number. Within each I/O bank, the VMV and VCCI are connected to each other to improve the ESD discharge path for any I/O pin against its VMV pin. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMVx supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMVx can be 1.2 V (A3PE600L and A3PE3000L only), 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCIB0, VMV1 to VCCIB1, etc.).

VCCPLA/B/C/D/E/F **PLL Supply Voltage**

Supply voltage to analog PLL, nominally 1.5 V or 1.2 V, depending on the device.

- 1.5 V for A3P250 and A3P1000 devices
- 1.2 V or 1.5 V for A3PE600L or A3PE3000L devices

When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *Miliary ProASIC3/EL Device Family User's Guide* for a complete board solution for the PLL analog power supply and ground.

- There is one VCCPLF pin on A3P250 and A3P1000 devices.
- There are six VCCPLX pins on A3PE600L and A3PE3000L devices.
