

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	440
Number of Logic Elements/Cells	3520
Total RAM Bits	81920
Number of I/O	18
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	25-XFBGA, WLCSP
Supplier Device Package	25-WLCSP (1.7x1.7)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/ice40lm4k-swg25tr

Table 1-1. iCE40LM Family Selection Guide

Part Number	iCE40LM1K	iCE40LM2K	iCE40LM4K
Logic Cells (LUT + Flip-Flop)	1100	2048	3520
RAM4K Memory Blocks	16	20	20
RAM4K RAM Bits	64K	80K	80K
Package	Programmable I/O Count		
25-pin WLCSP, 1.71 mm x 1.71 mm, 0.35 mm	18	18	18
36-pin ucBGA, 2.5 mm x 2.5 mm, 0.40 mm	28	28	28
49-pin ucBGA, 3 mm x 3 mm, 0.40 mm	37	37	37

Introduction

The iCE40LM family of ultra-low power FPGAs has three devices with densities ranging from 1100 to 3520 Look-Up Tables (LUTs). In addition to LUT-based, low-cost programmable logic, these devices also feature Embedded Block RAM (EBR), two Strobe Generators (LPSG, HSSG), two hardened I²C Controllers and two hardened SPI Controllers. These features allow the devices to be used in low-cost, high-volume consumer and mobile applications.

The iCE40LM devices are fabricated on a 40nm CMOS low power process. The device architecture has several features such as user configurable I²C and SPI Controllers, either as master or slave, and two Strobe Generators.

The iCE40LM FPGAs are available in very small form factor packages, with the smallest in 25-pin WLCSP. The 25-pin WLCSP package has a 0.35 mm ball pitch, resulting to an overall package size of 1.71 mm x 1.71 mm that easily fits into a lot of mobile applications. Table 1-1 shows the LUT densities, package and I/O pin count.

The iCE40LM devices offer enhanced I/O features such as pull-up resistors. Pull-up features are controllable on a “per-pin” basis.

Lattice provides a variety of design tools that allow complex designs to be efficiently implemented using the iCE40LM family of devices. Popular logic synthesis tools provide synthesis library support for iCE40LM. Lattice design tools use the synthesis tool output along with the user-specified preferences and constraints to place and route the design in the iCE40LM device. These tools extract the timing from the routing and back-annotate it into the design for timing verification.

Lattice provides many pre-engineered IP (Intellectual Property) modules, including a number of reference designs, licensed free of charge, optimized for the iCE40LM FPGA family. Lattice also can provide fully verified bit-stream for some of the widely used target functions in mobile device applications, such as ultra-low power sensor management, gesture recognition, IR remote, barcode emulator functions. Users can use these functions as offered by Lattice, or they can use the design to create their own unique required functions. For more information regarding Lattice's Reference Designs or fully-verified bitstreams, please contact your local Lattice representative.

Architecture Overview

The iCE40LM family architecture contains an array of Programmable Logic Blocks (PLB), two Strobe Generators, two user configurable I²C controllers, two user configurable SPI controllers, and blocks of sysMEM™ Embedded Block RAM (EBR) surrounded by Programmable I/O (PIO). Figure 2-1 shows the block diagram of the iCE40LM-4K device.

Figure 2-1. iCE40LM-4K Device, Top View

The logic blocks, Programmable Logic Blocks (PLB) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each column has either logic blocks or EBR blocks. The PIO cells are located at the top and bottom of the device, arranged in banks. The PLB contains the building blocks for logic, arithmetic, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

In the iCE40LM family, There are two sysIO banks, one on top and one on bottom. User can connect both V_{CCIO} s together, if all the I/Os are using the same voltage standard. Refer to the details in later sections of this document. The sysMEM EBRs are large 4 kbit, dedicated fast memory blocks. These blocks can be configured as RAM, ROM or FIFO with user logic using PLBs.

Every device in the family has two user SPI ports, one of these (right side) SPI port also supports programming and configuration of the device. The iCE40LM also includes two user I²C ports, and two Strobe Generators.

Routing

There are many resources provided in the iCE40LM devices to route signals individually with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PLB connections are made with three different types of routing resources: Adjacent (spans two PLBs), x4 (spans five PLBs) and x12 (spans thirteen PLBs). The Adjacent, x4 and x12 connections provide fast and efficient connections in the diagonal, horizontal and vertical directions.

The design tool takes the output of the synthesis tool and places and routes the design.

Clock/Control Distribution Network

Each iCE40LM device has six global inputs, two pins on the top bank and four pins on the bottom bank

These global inputs can be used as high fanout nets, clock, reset or enable signals. The dedicated global pins are identified as Gxx and the global buffers are identified as GBUF[7:0]. These six inputs may be used as general purpose I/O if they are not used to drive the clock nets.

Table 2-2 lists the connections between a specific global buffer and the inputs on a PLB. All global buffers optionally connect to the PLB CLK input. Any four of the eight global buffers can drive logic inputs to a PLB. Even-numbered global buffers optionally drive the Set/Reset input to a PLB. Similarly, odd-numbered buffers optionally drive the PLB clock-enable input. GBUF[7:6, 3:0] can connect directly to G[7:6, 3:0] pins respectively. GBUF4 and GBUF5 can connect to the two on-chip Strobe Generators (GBUF4 connects to LPSG, GBUF5 connects to HSSG).

Table 2-2. Global Buffer (GBUF) Connections to Programmable Logic Blocks

Global Buffer	LUT Inputs	Clock	Clock Enable	Reset
GBUF0	Yes, any 4 of 8 GBUF Inputs	Yes	Yes	
GBUF1		Yes		Yes
GBUF2		Yes	Yes	
GBUF3		Yes		Yes
GBUF4		Yes	Yes	
GBUF5		Yes		Yes
GBUF6		Yes	Yes	
GBUF7		Yes		Yes

The maximum frequency for the global buffers are shown in the iCE40LM External Switching Characteristics tables later in this document.

Global Hi-Z Control

The global high-impedance control signal, GHIZ, connects to all I/O pins on the iCE40LM device. This GHIZ signal is automatically asserted throughout the configuration process, forcing all user I/O pins into their high-impedance state.

Global Reset Control

The global reset control signal connects to all PLB and PIO flip-flops on the iCE40LM device. The global reset signal is automatically asserted throughout the configuration process, forcing all flip-flops to their defined wake-up state. For PLB flip-flops, the wake-up state is always reset, regardless of the PLB flip-flop primitive used in the application.

Table 2-3. PLL Signal Descriptions

Signal Name	Direction	Description
REFERENCECLK	Input	Input reference clock
BYPASS	Input	The BYPASS control selects which clock signal connects to the PLL-OUT output. 0 = PLL generated signal 1 = REFERENCECLK
EXTFEEDBACK	Input	External feedback input to PLL. Enabled when the FEEDBACK_PATH attribute is set to EXTERNAL.
DYNAMICDELAY[7:0]	Input	Fine delay adjustment control inputs. Enabled when DELAY_ADJUSTMENT_MODE is set to DYNAMIC.
LATCHINPUTVALUE	Input	When enabled, forces the PLL into low-power mode; PLL output is held static at the last input clock value. Set ENABLE ICEGATE_PORTA and PORTB to '1' to enable.
PLLOUTGLOBAL	Output	Output from the Phase-Locked Loop (PLL). Drives a global clock network on the FPGA. The port has optimal connections to global clock buffers GBUF4 and GBUF5.
PLLOUTCORE	Output	Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBAL port.
LOCK	Output	When High, indicates that the PLL output is phase aligned or locked to the input reference clock.
RESET	Input	Active low reset.

sysMEM Embedded Block RAM Memory

Larger iCE40LM device includes multiple high-speed synchronous sysMEM Embedded Block RAMs (EBRs), each 4 kbit in size. This memory can be used for a wide variety of purposes including data buffering, and FIFO.

sysMEM Memory Block

The sysMEM block can implement single port, pseudo dual port, or FIFO memories with programmable logic resources. Each block can be used in a variety of depths and widths as shown in Table 2-4.

Table 2-4. sysMEM Block Configurations¹

Block RAM Configuration	Block RAM Configuration and Size	WADDR Port Size (Bits)	WDATA Port Size (Bits)	RADDR Port Size (Bits)	RDATA Port Size (Bits)	MASK Port Size (Bits)
SB_RAM256x16 SB_RAM256x16NR SB_RAM256x16NW SB_RAM256x16NRNW	256x16 (4K)	8 [7:0]	16 [15:0]	8 [7:0]	16 [15:0]	16 [15:0]
SB_RAM512x8 SB_RAM512x8NR SB_RAM512x8NW SB_RAM512x8NRNW	512x8 (4K)	9 [8:0]	8 [7:0]	9 [8:0]	8 [7:0]	No Mask Port
SB_RAM1024x4 SB_RAM1024x4NR SB_RAM1024x4NW SB_RAM1024x4NRNW	1024x4 (4K)	10 [9:0]	4 [3:0]	10 [9:0]	4 [3:0]	No Mask Port
SB_RAM2048x2 SB_RAM2048x2NR SB_RAM2048x2NW SB_RAM2048x2NRNW	2048x2 (4K)	11 [10:0]	2 [1:0]	11 [10:0]	2 [1:0]	No Mask Port

1. For iCE40LM EBR primitives with a negative-edged Read or Write clock, the base primitive name is appended with a 'N' and a 'R' or 'W' depending on the clock that is affected.

sysIO Buffer Banks

iCE40LM devices have up to two I/O banks with independent V_{CCIO} rails. Configuration bank V_{CC_SPI} for the SPI I/Os is connected to V_{CCIO2} on the 25-pin WLCSP package.

Programmable I/O (PIO)

The programmable logic associated with an I/O is called a PIO. The individual PIOs are connected to their respective sysIO buffers and pads. The PIOs are placed on the top and bottom of the devices.

Figure 2-5. I/O Bank and Programmable I/O Cell

The PIO contains three blocks: an input register block, output register block iCEGate™ and tri-state register block. To save power, the optional iCEGate™ latch can selectively freeze the state of individual, non-registered inputs within an I/O bank. Note that the freeze signal is common to the bank. These blocks can operate in a variety of modes along with the necessary clock and selection logic.

Input Register Block

The input register blocks for the PIOs on all edges contain registers that can be used to condition high-speed interface signals before they are passed to the device core.

Output Register Block

The output register block can optionally register signals from the core of the device before they are passed to the sysIO buffers.

Figure 2-6 shows the input/output register block for the PIOs.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} , V_{CCIO_0} , V_{CCIO_2} and V_{CC_SPI} (V_{CC_SPI} is connected to V_{CCIO_2} on the 25-pin WLCSP and 36-pin ucBGA packages) reach the level defined in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. After the POR signal is deactivated, the FPGA core logic becomes active. You must ensure that all V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. The default configuration of the I/O pins in a device prior to configuration is tri-stated with a weak pull-up to V_{CCIO} . The I/O pins maintain the pre-configuration state until V_{CC} and V_{CCIO_2} reach the defined levels. The I/Os take on the software user-configured settings only after V_{CC_SPI} reaches the level and the device performs a proper download/configuration. Unused I/Os are automatically blocked and the pull-up termination is disabled.

Supported Standards

The iCE40LM sysIO buffer supports all single-ended input and output standards. The buffer supports the LVCMOS 1.8, 2.5, and 3.3 V standards. The buffer has individually configurable options for bus maintenance (weak pull-up or none).

Table 2-7 and Table 2-8 show the I/O standards (together with their supply and reference voltages) supported by the iCE40LM devices.

Table 2-7. Supported Input Standards

Input Standard	V_{CCIO} (Typical)		
	3.3 V	2.5 V	1.8 V
Single-Ended Interfaces			
LVCMOS33	Yes		
LVCMOS25		Yes	
LVCMOS18			Yes

Table 2-8. Supported Output Standards

Output Standard	V_{CCIO} (Typical)
Single-Ended Interfaces	
LVCMOS33	3.3
LVCMOS25	2.5
LVCMOS18	1.8

On-Chip Strobe Generators

The iCE40LM devices feature two different Strobe Generators. One is tailored for low-power operation (Low Power Strobe Generator – LPSG), and generates periodic strobes in the Microsecond (μ s) ranges. The other is tailored for high speed operation (High Speed Strobe Generator – HSSG), and generates periodic strobes in the Nanosecond (ns) ranges. Add a paragraph:

The Strobe Generators (HSSG and LPSG) provide fixed periodic strobes, and these strobes can be used as a clock source. When used as a clock source, the HSSG can provide strobe frequency in the range of 5 MHz - 20 MHz. The LPSG can provide strobe frequency in the range of 4 kHz - 20 kHz.

For further information on how to use the LPSG and HSSG, please refer to TN1275, [iCE40LM On-Chip Strobe Generator Usage Guide](#).

iCE40LM Configuration

This section describes the programming and configuration of the iCE40LM family.

Device Configuration

There are various ways to configure the Configuration RAM (CRAM) including:

- From a SPI Flash (Master SPI mode)
- System microprocessor to drive a Serial Slave SPI port (SSPI mode)

For more details on configuring the iCE40LM, please see TN1248, [iCE40 Programming and Configuration](#).

Power Saving Options

The iCE40LM devices feature iCEGate and PLL low power mode to allow users to meet the static and dynamic power requirements of their applications. Table 2-9 describes the function of these features.

Table 2-9. iCE40LM Power Saving Features Description

Device Subsystem	Feature Description
PLL	When LATCHINPUTVALUE is enabled, forces the PLL into low-power mode; PLL output held static at last input clock value.
iCEGate	To save power, the optional iCEGate latch can selectively freeze the state of individual, non-registered inputs within an I/O bank. Registered inputs are effectively frozen by their associated clock or clock-enable control.

Absolute Maximum Ratings^{1, 2, 3}

Supply Voltage V_{CC}	–0.5 V to 1.42 V
Output Supply Voltage V_{CCIO} and V_{CC_SPI}	–0.5 V to 3.60 V
PLL Power Supply, V_{CCPLL}	–0.5 V to 1.3 V
I/O Tri-state Voltage Applied	–0.5 V to 3.60 V
Dedicated Input Voltage Applied	–0.5 V to 3.60 V
Storage Temperature (Ambient)	–65 °C to 150 °C
Junction Temperature (T_J)	–55 °C to 125 °C

1. Stress above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice [Thermal Management](#) document is required.
3. All voltages referenced to GND.

Recommended Operating Conditions¹

Symbol	Parameter		Min.	Max.	Units
V _{CC} ¹	Core Supply Voltage		1.14	1.26	V
V _{CCIO} ^{1, 2, 3}	I/O Driver Supply Voltage	V _{CCIO_0} , V _{CCIO_2}	1.71	3.46	V
V _{CCPLL} ⁴	PLL Power Supply Voltage		1.14	1.26	V
V _{CC_SPI} ⁵	Config SPI port Power Supply Voltage		1.71	3.46	V
t _{JIND}	Junction Temperature Industrial Operation		−40	100	°C

1. Like power supplies must be tied together. V_{CCIO_0} to V_{CCIO_2} if they are at same supply voltage and if they meet the power up sequence requirement. Please refer to [Power Up Sequence](#) section. V_{CC} and V_{CCPLL} are not recommended to be tied together. Please refer to TN1252, [iCE40 Hardware Checklist](#).
2. See recommended voltages by I/O standard in subsequent table.
3. V_{CCIO} pins of unused I/O banks should be connected to the V_{CC} power supply on boards.
4. For 25-pin WLCSP, PLL is not supported.
5. For 25-pin WLCSP and 36-pin ucBGA packages, V_{CC_SPI} is connected to V_{CCIO_2} on the package. V_{CC_SPI} is used to power the SPI1 ports in both configuration mode and user mode.

Power Supply Ramp Rates^{1, 2}

Symbol	Parameter	Min.	Max.	Units
t_{RAMP}	Power supply ramp rates for all power supplies.	0.01	10	V/ms

1. Assumes monotonic ramp rates.
2. Power up sequence must be followed. Please refer to [Power Up Sequence](#) section.

Power-On-Reset Voltage Levels¹

Symbol	Parameter		Min.	Max.	Units
V _{PORUP}	Power-On-Reset ramp-up trip point (circuit monitoring V _{CC} , V _{CCIO_2} and V _{CC_SPI})	V _{CC}	0.67	0.99	V
		V _{CCIO_2} , V _{CC_SPI}	0.70	1.59	V
V _{PORDN}	Power-On-Reset ramp-down trip point (circuit monitoring V _{CC} , V _{CCIO_2} and V _{CC_SPI})	V _{CC}	—	0.66	V
		V _{CCIO_2} , V _{CC_SPI}	—	1.59	V

1. These POR trip points are only provided for guidance. Device operation is only characterized for power supply voltages specified under recommended operating conditions.

Power Up Sequence

For all iCE40LM devices, it is required to have the V_{CC}/V_{CCPLL} power supply powered up before all other power supplies. The V_{CC}/V_{CCPLL} has to be higher than 0.5 V before other supplies are powered from GND.

In addition, for all iCE40LM devices, it is required that V_{CCSPI} not be the last power supply to ramp up. The V_{CCSPI} has to be higher than 0.5 V before the last supply is ramped.

In the required power up sequence, V_{CC}/V_{CCPLL} should be ramped first. Following V_{CC}/V_{CCPLL} , V_{CCSPI} should be ramped next, followed by the remaining supplies. On the 25-pin WLCSP, V_{CCPLL} is connected to V_{CC} , and is powered up together with V_{CC} . On the 25-pin WLCSP and 36-pin caBGA, V_{CCIO_2} is connected to V_{CCSPI} , and should be powered up right after V_{CC}/V_{CCPLL} with V_{CCSPI} . Due to this connection, V_{CCIO_0} cannot connect to V_{CCIO_2} even if they are at the same supply voltage. The sequence is defined below:

- For 49-pin caBGA: V_{CC} , V_{CCPLL} , V_{CC_SPI} , V_{CCIO_0} and V_{CCIO_2} ; Order of V_{CCIO_0} and V_{CCIO_2} is not important.
- For 36-pin caBGA: V_{CC} , V_{CCPLL} , V_{CC_SPI}/V_{CCIO_2} , V_{CCIO_0}
- For 25-pin WLCSP: V_{CC}/V_{CCPLL} , V_{CC_SPI}/V_{CCIO_2} , V_{CCIO_0}

There is no power down sequence required. However, when partial power supplies are powered down, it is required that the above sequence is followed when these supplies are powered up again.

ESD Performance

Please contact Lattice Semiconductor for additional information.

DC Electrical Characteristics

Over Recommended Operating Conditions

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
I_{IL} , I_{IH} ^{1, 3, 4}	Input or I/O Leakage	$0V < V_{IN} < V_{CCIO} + 0.2 V$	—	—	+/-10	μA
C_1	I/O Capacitance ²	$V_{CCIO} = 3.3 V, 2.5 V, 1.8 V$ $V_{CC} = \text{Typ.}, V_{IO} = 0 \text{ to } V_{CCIO} + 0.2 V$	—	6	—	pf
C_2	Global Input Buffer Capacitance ²	$V_{CCIO} = 3.3 V, 2.5 V, 1.8 V$ $V_{CC} = \text{Typ.}, V_{IO} = 0 \text{ to } V_{CCIO} + 0.2 V$	—	6	—	pf
V_{HYST}	Input Hysteresis	$V_{CCIO} = 1.8 V, 2.5 V, 3.3 V$	—	200	—	mV
I_{PU}	Internal PIO Pull-up Current	$V_{CCIO} = 1.8 V, 0 < V_{IN} < 0.65 V_{CCIO}$	-3	—	-31	μA
		$V_{CCIO} = 2.5 V, 0 < V_{IN} < 0.65 V_{CCIO}$	-8	—	-72	μA
		$V_{CCIO} = 3.3 V, 0 < V_{IN} < 0.65 V_{CCIO}$	-11	—	-128	μA

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Internal pull-up resistors are disabled.

2. T_J 25 °C, $f = 1.0 \text{ MHz}$.

3. Please refer to V_{IL} and V_{IH} in the sysIO Single-Ended DC Electrical Characteristics table of this document.

4. Some products are clamped to a diode when V_{IN} is larger than V_{CCIO} .

Supply Current ^{1, 2, 3, 4}

Symbol	Parameter	Typ. VCC ⁴	Units
I _{CCSTDBY}	Core Power Supply Static Current	100	uA
I _{CCPLLSTDBY}	PLL Power Supply Static Current	11	uA
I _{CCIOSTDBY} , I _{CC_SPISTDBY}	V _{CCIO} , V _{CC_SPI} Power Supply Static Current	2.5	uA
I _{CCPEAK}	Core Power Supply Startup Peak Current	11.2	mA
I _{CCPLLPEAK}	PLL Power Supply Startup Peak Current	2.8	mA
I _{CCIOPEAK} , I _{CC_SPIPEAK}	V _{CCIO} , V _{CC_SPI} Power Supply Startup Peak Current	21.4	mA

- Assumes blank pattern with the following characteristics: all outputs are tri-stated, all inputs are configured as LVCMOS and held at V_{CCIO} or GND, on-chip PLL is off. For more detail with your specific design, use the Power Calculator tool. Power specified with master SPI configuration mode. Other modes may be up to 25% higher.
- Frequency = 0 MHz.
- T_J = 25 °C, power supplies at nominal voltage.
- Does not include pull-up.
- For 25-pin WLCSP, V_{CCPLL} is tied internally on the package, and V_{CC_SPI} is also connected to V_{CCIO_2} on the package.

User I²C Specifications

Parameter Symbol	Parameter Description	spec (STD Mode)			spec (FAST Mode)			Units
		Min	Typ	Max	Min	Typ	Max	
f _{SCL}	Maximum SCL clock frequency	—	—	100	—	—	400	kHz
t _{HI}	SCL clock HIGH Time	4	—	—	0.6	—	—	μs

					0.2	V _{CCIO} − 0.2	0.1	−0.1

1. Some products are clamped to a diode when V_{IN} is larger than V_{CCIO}.

Typical Building Block Function Performance^{1, 2}

Pin-to-Pin Performance (LVC MOS25)

Function	Timing	Units
Basic Functions		
16-bit decoder	16.5	ns
4:1 MUX	18.0	ns
16:1 MUX	19.5	ns

Register-to-Register Performance

Function	Timing	Units
Basic Functions		
16:1 MUX	110	MHz
16-bit adder	100	MHz
16-bit counter	100	MHz
64-bit counter	40	MHz
Embedded Memory Functions		
256x16 Pseudo-Dual Port RAM	150	MHz

1. The above timing numbers are generated using the iCECube2 design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device.

2. Using a V_{CC} of 1.14 V at Junction Temp 85 °C.

Derating Logic Timing

Logic timing provided in the following sections of the data sheet and the Lattice design tools are worst case numbers in the operating range. Actual delays may be much faster. Lattice design tools can provide logic timing numbers at a particular temperature and voltage.

Maximum sysIO Buffer Performance¹

I/O Standard	Max. Speed	Units
Inputs		
LVC MOS33	250	MHz
LVC MOS25	250	MHz
LVC MOS18	250	MHz
Outputs		
LVC MOS33	250	MHz
LVC MOS25	250	MHz
LVC MOS18	155	MHz

1. Measured with a toggling pattern.

iCE40LM Family Timing Adders

Over Recommended Commercial Operating Conditions^{1, 2, 3}

Buffer Type	Description	Timing (Typ.)	Units
Input Adjusters			
LVC MOS33	LVC MOS, $V_{CCIO} = 3.3\text{ V}$	0.18	nS
LVC MOS25	LVC MOS, $V_{CCIO} = 2.5\text{ V}$	0.00	nS
LVC MOS18	LVC MOS, $V_{CCIO} = 1.8\text{ V}$	0.19	nS
Output Adjusters			
LVC MOS33	LVC MOS, $V_{CCIO} = 3.3\text{ V}$	-0.12	nS
LVC MOS25	LVC MOS, $V_{CCIO} = 2.5\text{ V}$	0.00	nS
LVC MOS18	LVC MOS, $V_{CCIO} = 1.8\text{ V}$	1.32	nS

1. Timing adders are relative to LVC MOS25 and characterized but not tested on every device.

2. LVC MOS timing measured with the load specified in Switching Test Condition table.

3. Commercial timing numbers are shown.

iCE40LM External Switching Characteristics

Over Recommended Commercial Operating Conditions

Parameter	Description	Device			Units
Clocks					
Global Clocks					
$f_{\text{MAX_GBUF}}$	Frequency for Global Buffer Clock network	All devices		185	MHz
$t_{\text{W_GBUF}}$	Clock Pulse Width for Global Buffer	All devices	2	—	ns
$t_{\text{SKEW_GBUF}}$	Global Buffer Clock Skew Within a Device	All devices	—	650	ps
Pin-LUT-Pin Propagation Delay					
t_{PD}	Best case propagation delay through one LUT logic	All devices	—	9.1	ns
General I/O Pin Parameters (Using Global Buffer Clock without PLL)¹					
$t_{\text{SKEW_IO}}$	Data bus skew across a bank of IOs	All devices	—	450	ps
t_{CO}	Clock to Output - PIO Output Register	All devices	—	11.5	ns
t_{SU}	Clock to Data Setup - PIO Input Register	All devices	−0.23	—	ns
t_{H}	Clock to Data Hold - PIO Input Register	All devices	5.55	—	ns
1. 25-pin WLCSP package does not support PLL.					

sysCLOCK PLL Timing – Preliminary

Over Recommended Operating Conditions

Parameter	Descriptions	Conditions	Min.	Max.	Units
f_{IN}	Input Clock Frequency (REFERENCECLK, EXTFEEDBACK)		10	133	MHz
f_{OUT}	Output Clock Frequency (PLLOUT)		16	275	MHz
f_{VCO}	PLL VCO Frequency		533	1066	MHz
f_{PFD}	Phase Detector Input Frequency		10	133	MHz
AC Characteristics					
t_{DT}	Output Clock Duty Cycle		40	60	%
t_{PH}	Output Phase Accuracy		—	+/-12	deg
$t_{OPJIT}^{1, 5, 6}$	Output Clock Period Jitter	$f_{OUT} \leq 100$ MHz	—	450	ps p-p
		$f_{OUT} > 100$ MHz	—	0.5	UIPP
	Output Clock Cycle-to-cycle Jitter	$f_{OUT} \leq 100$ MHz	—	750	ps p-p
		$f_{OUT} > 100$ MHz	—	0.10	UIPP
	Output Clock Phase Jitter	$f_{PFD} \leq 25$ MHz	—	275	ps p-p
		$f_{PFD} > 25$ MHz	—	0.05	UIPP
t_W	Output Clock Pulse Width	At 90% or 10%	1.33	—	ns
$t_{LOCK}^{2,3}$	PLL Lock-in Time		—	50	us
t_{UNLOCK}	PLL Unlock Time		—	50	ns
t_{IPJIT}^4	Input Clock Period Jitter	$f_{PFD} \geq 20$ MHz	—	1000	ps p-p
		$f_{PFD} < 20$ MHz	—	0.02	UIPP
t_{FDTAP}	Fine Delay adjustment, per Tap		98	226	ps
t_{STABLE}^3	LATCHINPUTVALUE LOW to PLL Stable		—	500	ns
$t_{STABLE_PW}^3$	LATCHINPUTVALUE Pulse Width		100	—	ns
t_{RST}	RESET Pulse Width		10	—	ns
t_{RSTREC}	RESET Recovery Time		10	—	us
$t_{DYNAMIC_WD}$	DYNAMICDELAY Pulse Width		100	—	VCO Cycles

1. Period jitter sample is taken over 10,000 samples of the primary PLL output with a clean reference clock. Cycle-to-cycle jitter is taken over 1000 cycles. Phase jitter is taken over 2000 cycles. All values per JESD65B.
2. Output clock is valid after t_{LOCK} for PLL reset and dynamic delay adjustment.
3. At minimum f_{PFD} . As the f_{PFD} increases the time will decrease to approximately 60% the value listed.
4. Maximum limit to prevent PLL unlock from occurring. Does not imply the PLL will operate within the output specifications listed in this table.
5. The jitter values will increase with loading of the PLD fabric and in the presence of SSO noise.
6. PLL jitter and lock time measurements are based on an external clean clock source. With different clock source, these values may be different.

SPI Master Configuration Time¹

Symbol	Parameter	Conditions	Max.	Units
t _{CONFIG}	POR/CRESET_B to Device I/O Active	All devices - Low Frequency (Default)	95	ms
		All devices - Medium frequency	35	ms
		All devices - High frequency	18	ms

1. Assumes sysMEM Block is initialized to an all zero pattern if they are used.

sysCONFIG Port Timing Specifications

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
All Configuration Modes						
t _{CRESET_B}	Minimum CRESET_B LOW pulse width required to restart configuration, from falling edge to rising edge		200	—	—	ns
t _{DONE_IO}	Number of configuration clock cycles after CDONE goes HIGH before the PIO pins are activated		49	—	—	Cycles
Slave SPI						
t _{CR_SCK}	Minimum time from a rising edge on CRESET_B until the first SPI WRITE operation, first SPI_XCK clock. During this time, the iCE40LM device is clearing its internal configuration memory		1200	—	—	μs
f _{MAX}	CCLK clock frequency	Write	1	—	25	MHz
		Read ¹	—	15	—	MHz
t _{CCLKH}	CCLK clock pulsewidth HIGH		20	—	—	ns
t _{CCLKL}	CCLK clock pulsewidth LOW		20	—	—	ns
t _{TSU}	CCLK setup time		12	—	—	ns
t _{STH}	CCLK hold time		12	—	—	ns
t _{STCO}	CCLK falling edge to valid output		13	—	—	ns
Master SPI						
f _{MCLK}	MCLK clock frequency	Low Frequency (Default)	6.5		13	MHz
		Medium Frequency	19.5		38	MHz
		High Frequency	33		66	MHz
t _{MCLK}	CRESET_B HIGH to first MCLK edge		1200	—	—	μs

1. Supported with 1.2 V Vcc and at 25 °C.

Switching Test Conditions

Figure 3-1 shows the output test load used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Table 3-1.

Figure 3-1. Output Test Load, LVCMOS Standards

Table 3-1. Test Fixture Required Components, Non-Terminated Interfaces

Test Condition	R_1	C_L	Timing Reference	V_T
LVCMOS settings (L -> H, H -> L)	∞	0 pF	LVCMOS 3.3 = 1.5 V	—
			LVCMOS 2.5 = $V_{CCIO}/2$	—
			LVCMOS 1.8 = $V_{CCIO}/2$	—
LVCMOS 3.3 (Z -> H)	188	0 pF	1.5	V_{OL}
LVCMOS 3.3 (Z -> L)			1.5	V_{OH}
Other LVCMOS (Z -> H)			$V_{CCIO}/2$	V_{OL}
Other LVCMOS (Z -> L)			$V_{CCIO}/2$	V_{OH}
LVCMOS (H -> Z)			$V_{OH} - 0.15$	V_{OL}
LVCMOS (L -> Z)			$V_{OL} - 0.15$	V_{OH}

Note: Output test conditions for all other interfaces are determined by the respective standards.

Signal Descriptions

Signal Name		Function	I/O	Description
Power Supplies				
V _{CC}		Power	—	Core Power Supply
V _{CCIO_0} , V _{CCIO_2}		Power	—	Power for I/Os in Bank 0 and 2.
V _{CC_SPI}		Power	—	Power supply for SPI1 ports. For 25-pin WLCSP and 36-pin ucBGA packages, this signal is connected to V _{CCIO_2} .
V _{CCPLL}		Power	—	Power supply for PLL. For 25-pin WLCSP, this is connected internally to V _{CC} .
GND/GNDPLL		GROUND	—	Ground
Configuration				
CRESETB		Configuration	I	Configuration Reset, active LOW. No internal pull-up resistor. Either actively driven externally or connect an 10 kOhm pull-up to V _{CCIO_2} .
CDONE		Configuration	I/O	Configuration Done. Includes a weak pull-up resistor to V _{CCIO_2} .
Config SPI				
Primary	Secondary			
PIOB_xx[HD]	SPI_SCK	Configuration	I/O	This pin is shared with device configuration. During configuration: In Master SPI mode, this pin outputs the clock to external SPI memory. In Slave SPI mode, this pin inputs the clock from external processor.
		General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function [HD]=High Drive I/O.
PIOB_xx[HD]	SPI_SDO	Configuration	Output	This pin is shared with device configuration. During configuration: In Master SPI mode, this pin outputs the command data to external SPI memory. In Slave SPI mode, this pin connects to the MISO pin of the external processor.
		General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function [HD]=High Drive I/O.
PIOB_xx[HD]	SPI_SI	Configuration	Input	This pin is shared with device configuration. During configuration: In Master SPI mode, this pin receives data from external SPI memory. In Slave SPI mode, this pin connects to the MOSI pin of the external processor.
		General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function [HD]=High Drive I/O.

Signal Name		Function	I/O	Description
PIOB_xx[HD]	SPI_SS_B	Configuration	I/O	This pin is shared with device configuration. During configuration: In Master SPI mode, this pin outputs to the external SPI memory. In Slave SPI mode, this pin inputs from the external processor.
		General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function [HD]=High Drive I/O.
Global Signals				
Primary	Secondary			
PIOT_xx	G0	General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function.
		Global	Input	Global input used for high fanout, or clock/reset net. The G0 pin drives the GBUF0 global buffer.
PIOT_xx	G1	General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function.
		Global	Input	Global input used for high fanout, or clock/reset net. The G1 pin drives the GBUF1 global buffer.
PIOT_xx	G3	General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function.
		Global	Input	Global input used for high fanout, or clock/reset net. The G3 pin drives the GBUF3 global buffer.
PIOT_xx	G4	General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function.
		Global	Input	Global input used for high fanout, or clock/reset net. The G4 pin drives the GBUF4 global buffer.
PIOT_xx	G5	General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function.
		Global	Input	Global input used for high fanout, or clock/reset net. The G5 pin drives the GBUF5 global buffer.
PIOB_xx	G6	General I/O	I/O	In user mode, after configuration, this pin can be programmed as general I/O in user function.
		Global	Input	Global input used for high fanout, or clock/reset net. The G6 pin drives the GBUF6 global buffer.
LED Signals				
PIOT_xx		General I/O	I/O	In user mode, with user's choice, this pin can be programmed as I/O in user function in the top (xx = I/O location).
PIOB_xx		General I/O	I/O	In user mode, with user's choice, this pin can be programmed as I/O in user function in the bottom (xx = I/O location) [HD]=High Drive I/O.

iCE40LM Part Number Description

Ordering Part Numbers

Part Number	LUTs	Supply Voltage	Package	Leads	Temp.
iCE40LM1K-SWG25TR	1100	1.2 V	Halogen-Free caBGA	25	IND
