

Welcome to [E-XFL.COM](#)

Understanding [Embedded - Microprocessors](#)

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of [Embedded - Microprocessors](#)

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details

Product Status	Obsolete
Core Processor	PowerPC e500
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	1.0GHz
Co-Processors/DSP	Signal Processing; SPE, Security; SEC
RAM Controllers	DDR, DDR2, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (4)
SATA	-
USB	-
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	Cryptography, Random Number Generator
Package / Case	783-BBGA, FCBGA
Supplier Device Package	783-FCBGA (29x29)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc8548ehxaqg

Figure 1. Device Block Diagram

1.1 Key Features

The following list provides an overview of the device feature set:

- High-performance 32-bit core built on Power Architecture® technology.
 - 32-Kbyte L1 instruction cache and 32-Kbyte L1 data cache with parity protection. Caches can be locked entirely or on a per-line basis, with separate locking for instructions and data.
 - Signal-processing engine (SPE) APU (auxiliary processing unit). Provides an extensive instruction set for vector (64-bit) integer and fractional operations. These instructions use both the upper and lower words of the 64-bit GPRs as they are defined by the SPE APU.
 - Double-precision floating-point APU. Provides an instruction set for double-precision (64-bit) floating-point instructions that use the 64-bit GPRs.
 - 36-bit real addressing
 - Embedded vector and scalar single-precision floating-point APUs. Provide an instruction set for single-precision (32-bit) floating-point instructions.
 - Memory management unit (MMU). Especially designed for embedded applications. Supports 4-Kbyte to 4-Gbyte page sizes.
 - Enhanced hardware and software debug support

- Memory prefetching of PCI read accesses
- Supports posting of processor-to-PCI and PCI-to-memory writes
- PCI 3.3-V compatible
- Selectable hardware-enforced coherency
- Serial RapidIO™ interface unit
 - Supports *RapidIO™ Interconnect Specification, Revision 1.2*
 - Both 1× and 4× LP-serial link interfaces
 - Long- and short-haul electricals with selectable pre-compensation
 - Transmission rates of 1.25, 2.5, and 3.125 Gbaud (data rates of 1.0, 2.0, and 2.5 Gbps) per lane
 - Auto detection of 1- and 4-mode operation during port initialization
 - Link initialization and synchronization
 - Large and small size transport information field support selectable at initialization time
 - 34-bit addressing
 - Up to 256 bytes data payload
 - All transaction flows and priorities
 - Atomic set/clear/increment/decrement for read-modify-write operations
 - Generation of IO_READ_HOME and FLUSH with data for accessing cache-coherent data at a remote memory system
 - Receiver-controlled flow control
 - Error detection, recovery, and time-out for packets and control symbols as required by the RapidIO specification
 - Register and register bit extensions as described in part VIII (Error Management) of the RapidIO specification
 - Hardware recovery only
 - Register support is not required for software-mediated error recovery.
 - Accept-all mode of operation for fail-over support
 - Support for RapidIO error injection
 - Internal LP-serial and application interface-level loopback modes
 - Memory and PHY BIST for at-speed production test
- RapidIO-compatible message unit
 - 4 Kbytes of payload per message
 - Up to sixteen 256-byte segments per message
 - Two inbound data message structures within the inbox
 - Capable of receiving three letters at any mailbox
 - Two outbound data message structures within the outbox
 - Capable of sending three letters simultaneously
 - Single segment multicast to up to 32 devIDs
 - Chaining and direct modes in the outbox

Figure 14 shows the TBI transmit AC timing diagram.

Figure 14. TBI Transmit AC Timing Diagram

8.2.4.2 TBI Receive AC Timing Specifications

This table provides the TBI receive AC timing specifications.

Table 31. TBI Receive AC Timing Specifications

Parameter/Condition	Symbol ¹	Min	Typ	Max	Unit
TSECn_RX_CLK[0:1] clock period	t_{TRX}	—	16.0	—	ns
TSECn_RX_CLK[0:1] skew	t_{SKTRX}	7.5	—	8.5	ns
TSECn_RX_CLK[0:1] duty cycle	t_{TRXH}/t_{TRX}	40	—	60	%
RCG[9:0] setup time to rising TSECn_RX_CLK	t_{TRDVKH}	2.5	—	—	ns
RCG[9:0] hold time to rising TSECn_RX_CLK	t_{TRDXKH}	1.5	—	—	ns
TSECn_RX_CLK[0:1] clock rise time (20%–80%)	t_{TRXR}^2	0.7	—	2.4	ns
TSECn_RX_CLK[0:1] clock fall time (80%–20%)	t_{TRXF}^2	0.7	—	2.4	ns

Notes:

- The symbols used for timing specifications follow the pattern of $t_{(\text{first two letters of functional block})(\text{signal})(\text{state})(\text{reference})(\text{state})}$ for inputs and $t_{(\text{first two letters of functional block})(\text{reference})(\text{state})(\text{signal})(\text{state})}$ for outputs. For example, t_{TRDVKH} symbolizes TBI receive timing (TR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{TRX} clock reference (K) going to the high (H) state or setup time. Also, t_{TRDXKH} symbolizes TBI receive timing (TR) with respect to the time data input signals (D) went invalid (X) relative to the t_{TRX} clock reference (K) going to the high (H) state. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{TRX} represents the TBI (T) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall). For symbols representing skews, the subscript is skew (SK) followed by the clock that is being skewed (TRX).
- Guaranteed by design.

Figure 15 shows the TBI receive AC timing diagram.

Figure 15. TBI Receive AC Timing Diagram

8.2.5 TBI Single-Clock Mode AC Specifications

When the eTSEC is configured for TBI modes, all clocks are supplied from external sources to the relevant eTSEC interface. In single-clock TBI mode, when TBICON[CLKSEL] = 1, a 125-MHz TBI receive clock is supplied on the TSECn_RX_CLK pin (no receive clock is used on TSECn_TX_CLK in this mode, whereas for the dual-clock mode this is the PMA1 receive clock). The 125-MHz transmit clock is applied on the TSEC_GTX_CLK125 pin in all TBI modes.

A summary of the single-clock TBI mode AC specifications for receive appears in Table 32.

Table 32. TBI single-clock Mode Receive AC Timing Specification

Parameter/Condition	Symbol	Min	Typ	Max	Unit
RX_CLK clock period	t_{TRRX}	7.5	8.0	8.5	ns
RX_CLK duty cycle	$t_{TRRH/TRRX}$	40	50	60	%
RX_CLK peak-to-peak jitter	t_{TRRJ}	—	—	250	ps
Rise time RX_CLK (20%–80%)	t_{TRRR}	—	—	1.0	ns
Fall time RX_CLK (80%–20%)	t_{TRRF}	—	—	1.0	ns
RCG[9:0] setup time to RX_CLK rising edge	$t_{TRRDVKH}$	2.0	—	—	ns
RCG[9:0] hold time to RX_CLK rising edge	$t_{TRRDVKH}$	1.0	—	—	ns

- The SD_REF_CLK and $\overline{\text{SD_REF_CLK}}$ are internally AC-coupled differential inputs as shown in Figure 39. Each differential clock input (SD_REF_CLK or $\overline{\text{SD_REF_CLK}}$) has a 50- Ω termination to SGND_SRDSn (xcorevss) followed by on-chip AC-coupling.
- The external reference clock driver must be able to drive this termination.
- The SerDes reference clock input can be either differential or single-ended. See the differential mode and single-ended mode description below for further detailed requirements.
- The maximum average current requirement that also determines the common mode voltage range:
 - When the SerDes reference clock differential inputs are DC coupled externally with the clock driver chip, the maximum average current allowed for each input pin is 8 mA. In this case, the exact common mode input voltage is not critical as long as it is within the range allowed by the maximum average current of 8 mA (see the following bullet for more detail), since the input is AC-coupled on-chip.
 - This current limitation sets the maximum common mode input voltage to be less than 0.4 V ($0.4 \text{ V}/50 = 8 \text{ mA}$) while the minimum common mode input level is 0.1 V above SGND_SRDSn (xcorevss). For example, a clock with a 50/50 duty cycle can be produced by a clock driver with output driven by its current source from 0 to 16 mA (0–0.8 V), such that each phase of the differential input has a single-ended swing from 0 V to 800 mV with the common mode voltage at 400 mV.
 - If the device driving the SD_REF_CLK and $\overline{\text{SD_REF_CLK}}$ inputs cannot drive 50 Ω to SGND_SRDSn (xcorevss) DC, or it exceeds the maximum input current limitations, then it must be AC-coupled off-chip.
- The input amplitude requirement:
 - This requirement is described in detail in the following sections.

Figure 39. Receiver of SerDes Reference Clocks

16.2.2 DC Level Requirement for SerDes Reference Clocks

The DC level requirement for the SerDes reference clock inputs is different depending on the signaling mode used to connect the clock driver chip and SerDes reference clock inputs as described below:

- Differential mode

- The input amplitude of the differential clock must be between 400 and 1600 mV differential peak-peak (or between 200 and 800 mV differential peak). In other words, each signal wire of the differential pair must have a single-ended swing less than 800 mV and greater than 200 mV. This requirement is the same for both external DC- or AC-coupled connection.
- For external DC-coupled connection, as described in [Section 16.2.1, “SerDes Reference Clock Receiver Characteristics,”](#) the maximum average current requirements sets the requirement for average voltage (common mode voltage) to be between 100 and 400 mV. [Figure 40](#) shows the SerDes reference clock input requirement for DC-coupled connection scheme.
- For external AC-coupled connection, there is no common mode voltage requirement for the clock driver. Since the external AC-coupling capacitor blocks the DC level, the clock driver and the SerDes reference clock receiver operate in different command mode voltages. The SerDes reference clock receiver in this connection scheme has its common mode voltage set to SGND_SRDSn. Each signal wire of the differential inputs is allowed to swing below and above the command mode voltage (SGND_SRDSn). [Figure 41](#) shows the SerDes reference clock input requirement for AC-coupled connection scheme.
- Single-ended mode
 - The reference clock can also be single-ended. The SD_REF_CLK input amplitude (single-ended swing) must be between 400 and 800 mV peak-to-peak (from V_{min} to V_{max}) with SD_REF_CLK either left unconnected or tied to ground.
 - The SD_REF_CLK input average voltage must be between 200 and 400 mV. [Figure 42](#) shows the SerDes reference clock input requirement for single-ended signaling mode.
 - To meet the input amplitude requirement, the reference clock inputs might need to be DC- or AC-coupled externally. For the best noise performance, the reference of the clock could be DC- or AC-coupled into the unused phase (SD_REF_CLK) through the same source impedance as the clock input (SD_REF_CLK) in use.

Figure 40. Differential Reference Clock Input DC Requirements (External DC-Coupled)

Table 56. Differential Transmitter (TX) Output Specifications (continued)

Symbol	Parameter	Min	Nom	Max	Unit	Comments
$V_{TX-DC-CM}$	The TX DC common mode voltage	0	—	3.6	V	The allowed DC common mode voltage under any conditions. See Note 6.
$I_{TX-SHORT}$	TX short circuit current limit	—	—	90	mA	The total current the transmitter can provide when shorted to its ground
$T_{TX-IDLE-MIN}$	Minimum time spent in electrical idle	50	—		UI	Minimum time a transmitter must be in electrical idle utilized by the receiver to start looking for an electrical idle exit after successfully receiving an electrical idle ordered set
$T_{TX-IDLE-SET-TO-IDLE}$	Maximum time to transition to a valid electrical idle after sending an electrical idle ordered set	—	—	20	UI	After sending an electrical idle ordered set, the transmitter must meet all electrical idle specifications within this time. This is considered a debounce time for the transmitter to meet electrical idle after transitioning from L0.
$T_{TX-IDLE-TO-DIFF-DATA}$	Maximum time to transition to valid TX specifications after leaving an electrical idle condition	—	—	20	UI	Maximum time to meet all TX specifications when transitioning from electrical idle to sending differential data. This is considered a debounce time for the TX to meet all TX specifications after leaving electrical idle
$RL_{TX-DIFF}$	Differential return loss	12	—	—	dB	Measured over 50 MHz to 1.25 GHz. See Note 4.
RL_{TX-CM}	Common mode return loss	6	—	—	dB	Measured over 50 MHz to 1.25 GHz. See Note 4.
$Z_{TX-DIFF-DC}$	DC differential TX impedance	80	100	120	Ω	TX DC differential mode low impedance
Z_{TX-DC}	Transmitter DC impedance	40	—	—	Ω	Required TX D+ as well as D– DC impedance during all states
$L_{TX-SKEW}$	Lane-to-lane output skew	—	—	500 + 2 UI	ps	Static skew between any two transmitter lanes within a single Link
C_{TX}	AC coupling capacitor	75	—	200	nF	All transmitters shall be AC coupled. The AC coupling is required either within the media or within the transmitting component itself. See note 8.

18 Serial RapidIO

This section describes the DC and AC electrical specifications for the RapidIO interface of the MPC8548E, for the LP-Serial physical layer. The electrical specifications cover both single- and multiple-lane links. Two transmitters (short and long run) and a single receiver are specified for each of three baud rates, 1.25, 2.50, and 3.125 GBaud.

Two transmitter specifications allow for solutions ranging from simple board-to-board interconnect to driving two connectors across a backplane. A single receiver specification is given that accepts signals from both the short- and long-run transmitter specifications.

The short-run transmitter must be used mainly for chip-to-chip connections on either the same printed-circuit board or across a single connector. This covers the case where connections are made to a mezzanine (daughter) card. The minimum swings of the short-run specification reduce the overall power used by the transceivers.

The long-run transmitter specifications use larger voltage swings that are capable of driving signals across backplanes. This allows a user to drive signals across two connectors and a backplane. The specifications allow a distance of at least 50 cm at all baud rates.

All unit intervals are specified with a tolerance of ± 100 ppm. The worst case frequency difference between any transmit and receive clock is 200 ppm.

To ensure interoperability between drivers and receivers of different vendors and technologies, AC coupling at the receiver input must be used.

18.1 DC Requirements for Serial RapidIO SD_REF_CLK and SD_REF_CLK

For more information, see [Section 16.2, “SerDes Reference Clocks.”](#)

18.2 AC Requirements for Serial RapidIO SD_REF_CLK and SD_REF_CLK

[Table 58](#) lists the Serial RapidIO SD_REF_CLK and $\overline{\text{SD_REF_CLK}}$ AC requirements.

Table 58. SD_REF_CLK and $\overline{\text{SD_REF_CLK}}$ AC Requirements

Symbol	Parameter Description	Min	Typ	Max	Unit	Comments
t_{REF}	REFCLK cycle time	—	10(8)	—	ns	8 ns applies only to serial RapidIO with 125-MHz reference clock
t_{REFCJ}	REFCLK cycle-to-cycle jitter. Difference in the period of any two adjacent REFCLK cycles.	—	—	80	ps	—
t_{REFPJ}	Phase jitter. Deviation in edge location with respect to mean edge location.	–40	—	40	ps	—

18.3 Signal Definitions

LP-serial links use differential signaling. This section defines terms used in the description and specification of differential signals. Figure 51 shows how the signals are defined. The figures show waveforms for either a transmitter output (TD and $\overline{\text{TD}}$) or a receiver input (RD and $\overline{\text{RD}}$). Each signal swings between A volts and B volts where $A > B$. Using these waveforms, the definitions are as follows:

1. The transmitter output signals and the receiver input signals TD, $\overline{\text{TD}}$, RD, and $\overline{\text{RD}}$ each have a peak-to-peak swing of $A - B$ volts.
2. The differential output signal of the transmitter, V_{OD} , is defined as $V_{\text{TD}} - V_{\overline{\text{TD}}}$.
3. The differential input signal of the receiver, V_{ID} , is defined as $V_{\text{RD}} - V_{\overline{\text{RD}}}$.
4. The differential output signal of the transmitter and the differential input signal of the receiver each range from $A - B$ to $-(A - B)$ volts.
5. The peak value of the differential transmitter output signal and the differential receiver input signal is $A - B$ volts.
6. The peak-to-peak value of the differential transmitter output signal and the differential receiver input signal is $2 \times (A - B)$ volts.

Figure 51. Differential Peak-Peak Voltage of Transmitter or Receiver

To illustrate these definitions using real values, consider the case of a CML (current mode logic) transmitter that has a common mode voltage of 2.25 V and each of its outputs, TD and $\overline{\text{TD}}$, has a swing that goes between 2.5 and 2.0 V. Using these values, the peak-to-peak voltage swing of the signals TD and $\overline{\text{TD}}$ is 500 mVp-p. The differential output signal ranges between 500 and -500 mV. The peak differential voltage is 500 mV. The peak-to-peak differential voltage is 1000 mVp-p.

18.4 Equalization

With the use of high-speed serial links, the interconnect media causes degradation of the signal at the receiver. Effects such as inter-symbol interference (ISI) or data dependent jitter are produced. This loss can be large enough to degrade the eye opening at the receiver beyond what is allowed in the specification. To negate a portion of these effects, equalization can be used. The most common equalization techniques that can be used are:

- A passive high pass filter network placed at the receiver. This is often referred to as passive equalization.
- The use of active circuits in the receiver. This is often referred to as adaptive equalization.

Top view drawing of a rectangular lid. The drawing shows a rectangle with a dashed center line. Dimensions are indicated: 29 (width), 28.7 MAX LID ZONE (width), 28.7 MAX LID ZONE (height), and 29 (height). A chamfer is indicated at the top-left corner with the label "A1 CORNER LID CHAMFER". A feature is indicated at the bottom-left corner with the label "4X" and a symbol for a fillet with a radius of 0.2. The drawing is labeled "TOP VIEW" at the bottom.

as shown in Figure 63. If this is not possible, the isolation resistor allows future access to $\overline{\text{TRST}}$ in case a JTAG interface may need to be wired onto the system in future debug situations.

- No pull-up/pull-down is required for TDI, TMS, TDO, or TCK.

Figure 62. COP Connector Physical Pinout

Table 88. Document Revision History (continued)

Rev. Number	Date	Substantive Change(s)
4	04/2009	- In Table 1, "Absolute Maximum Ratings ¹," and in Table 2, "Recommended Operating Conditions," moved text, "MII management voltage" from LV_{DD}/TV_{DD} to OV_{DD}, added "Ethernet management" to OVDD row of input voltage section. - In Table 5, "SYSCLK AC Timing Specifications," added notes 7 and 8 to SYSCLK frequency and cycle time. - In Table 36, "MII Management DC Electrical Characteristics," changed all instances of LV_{DD}/OV_{DD} to OV_{DD}. - Modified Section 16, "High-Speed Serial Interfaces (HSSI)," to reflect that there is only one SerDes. - Modified DDR clk rate min from 133 to 166 MHz. - Modified note in Table 75, "Processor Core Clocking Specifications (MPC8548E and MPC8547E)," to "T_{RX-EYE-MEDIAN-to-MAX-JITTER}." - In Table 56, "Differential Transmitter (TX) Output Specifications," modified equations in Comments column, and changed all instances of "LO" to "L0." Also added note 8. - In Table 57, "Differential Receiver (RX) Input Specifications," modified equations in Comments column, and in note 3, changed "TRX-EYE-MEDIAN-to-MAX-JITTER," to "T_{RX-EYE-MEDIAN-to-MAX-JITTER}." - Modified Table 83, "Frequency Options of SYSCLK with Respect to Memory Bus Speeds." - Added a note on Section 4.1, "System Clock Timing," to limit the SYSCLK to 100 MHz if the core frequency is less than 1200 MHz - In Table 71, "MPC8548E Pinout Listing" Table 72, "MPC8547E Pinout Listing" Table 73, "MPC8545E Pinout Listing" Table 74, "MPC8543E Pinout Listing," added note 5 to LA[28:31]. - Added note to Table 83, "Frequency Options of SYSCLK with Respect to Memory Bus Speeds."
3	01/2009	[Section 4.6, "Platform Frequency Requirements for PCI-Express and Serial RapidIO." Changed minimum frequency equation to be 527 MHz for PCI x8. - In Table 5, added note 7. Section 4.5, "Platform to FIFO Restrictions." Changed platform clock frequency to 4.2. Section 8.1, "Enhanced Three-Speed Ethernet Controller (eTSEC) (10/100/1Gb Mbps)—GMII/MII/TBI/RGMII/RTBI/RMII Electrical Characteristics." Added MII after GMII and add 'or 2.5 V' after 3.3 V. - In Table 23, modified table title to include GMII, MII, RMII, and TBI. - In Table 24 and Table 25, changed clock period minimum to 5.3. - In Table 25, added a note. - In Table 26, Table 27, Table 28, Table 29, and Table 30, removed subtitle from table title. - In Table 30 and Figure 15, changed all instances of PMA to TSEC_n. - In Section 8.2.5, "TBI Single-Clock Mode AC Specifications." Replaced first paragraph. - In Table 34, Table 35, Figure 18, and Figure 20, changed all instances of REF_CLK to TSEC_n_TX_CLK. - In Table 36, changed all instances of OV_{DD} to LV_{DD}/TV_{DD}. - In Table 37, "MII Management AC Timing Specifications," changed MDC minimum clock pulse width high from 32 to 48 ns. - Added new section, Section 16, "High-Speed Serial Interfaces (HSSI)." Section 16.1, "DC Requirements for PCI Express SD_REF_CLK and SD_REF_CLK." Added new paragraph. Section 17.1, "DC Requirements for Serial RapidIO SD_REF_CLK and SD_REF_CLK." Added new paragraph. - Added information to Figure 63, both in figure and in note. Section 22.3, "Decoupling Recommendations." Modified the recommendation. Table 87, "Part Numbering Nomenclature." In Silicon Version column added Ver. 2.1.2.
