
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e500
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	1.2GHz
Co-Processors/DSP	Signal Processing; SPE, Security; SEC
RAM Controllers	DDR, DDR2, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (4)
SATA	-
USB	-
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	Cryptography, Random Number Generator
Package / Case	783-BBGA, FCBGA
Supplier Device Package	783-FCBGA (29x29)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc8548ehxatg

— Performance monitor facility that is similar to, but separate from, the device performance monitor

The e500 defines features that are not implemented on this device. It also generally defines some features that this device implements more specifically. An understanding of these differences can be critical to ensure proper operations.

- 512-Kbyte L2 cache/SRAM
  - — Flexible configuration.
  - — Full ECC support on 64-bit boundary in both cache and SRAM modes
  - — Cache mode supports instruction caching, data caching, or both.
  - — External masters can force data to be allocated into the cache through programmed memory ranges or special transaction types (stashing).
  - — 1, 2, or 4 ways can be configured for stashing only.
  - — Eight-way set-associative cache organization (32-byte cache lines)
  - — Supports locking entire cache or selected lines. Individual line locks are set and cleared through Book E instructions or by externally mastered transactions.
  - — Global locking and Flash clearing done through writes to L2 configuration registers
  - — Instruction and data locks can be Flash cleared separately.
  - — SRAM features include the following:
    - – I/O devices access SRAM regions by marking transactions as snoopable (global).
    - – Regions can reside at any aligned location in the memory map.
    - – Byte-accessible ECC is protected using read-modify-write transaction accesses for smaller-than-cache-line accesses.
- Address translation and mapping unit (ATMU)
  - — Eight local access windows define mapping within local 36-bit address space.
  - — Inbound and outbound ATMUs map to larger external address spaces.
    - – Three inbound windows plus a configuration window on PCI/PCI-X and PCI Express
    - – Four inbound windows plus a default window on RapidIO™
    - – Four outbound windows plus default translation for PCI/PCI-X and PCI Express
    - – Eight outbound windows plus default translation for RapidIO with segmentation and sub-segmentation support
- DDR/DDR2 memory controller
  - — Programmable timing supporting DDR and DDR2 SDRAM
  - — 64-bit data interface
  - — Four banks of memory supported, each up to 4 Gbytes, to a maximum of 16 Gbytes
  - — DRAM chip configurations from 64 Mbits to 4 Gbits with ×8/×16 data ports
  - — Full ECC support
  - — Page mode support
    - – Up to 16 simultaneous open pages for DDR

  - Up to 32 simultaneous open pages for DDR2
- Contiguous or discontiguous memory mapping
- Read-modify-write support for RapidIO atomic increment, decrement, set, and clear transactions
- Sleep mode support for self-refresh SDRAM
- On-die termination support when using DDR2
- Supports auto refreshing
- On-the-fly power management using CKE signal
- Registered DIMM support
- Fast memory access via JTAG port
- 2.5-V SSTL_2 compatible I/O (1.8-V SSTL_1.8 for DDR2)
- Support for battery-backed main memory

- Programmable interrupt controller (PIC)
  - Programming model is compliant with the OpenPIC architecture.
  - Supports 16 programmable interrupt and processor task priority levels
  - Supports 12 discrete external interrupts
  - Supports 4 message interrupts with 32-bit messages
  - Supports connection of an external interrupt controller such as the 8259 programmable interrupt controller
  - Four global high-resolution timers/counters that can generate interrupts
  - Supports a variety of other internal interrupt sources
  - Supports fully nested interrupt delivery
  - Interrupts can be routed to external pin for external processing.
  - Interrupts can be routed to the e500 core's standard or critical interrupt inputs.
  - Interrupt summary registers allow fast identification of interrupt source.
- Integrated security engine (SEC) optimized to process all the algorithms associated with IPSec, IKE, WTLS/WAP, SSL/TLS, and 3GPP
  - Four crypto-channels, each supporting multi-command descriptor chains
    - Dynamic assignment of crypto-execution units via an integrated controller
    - Buffer size of 256 bytes for each execution unit, with flow control for large data sizes
  - PKEU—public key execution unit
    - RSA and Diffie-Hellman; programmable field size up to 2048 bits
    - Elliptic curve cryptography with F_2m and F(p) modes and programmable field size up to 511 bits
  - DEU—Data Encryption Standard execution unit
    - DES, 3DES
    - Two key (K1, K2) or three key (K1, K2, K3)
    - ECB and CBC modes for both DES and 3DES

  - Memory prefetching of PCI read accesses
  - Supports posting of processor-to-PCI and PCI-to-memory writes
  - PCI 3.3-V compatible
  - Selectable hardware-enforced coherency
- Serial RapidIO™ interface unit
  - Supports *RapidIO™ Interconnect Specification, Revision 1.2*
  - Both 1× and 4× LP-serial link interfaces
  - Long- and short-haul electricals with selectable pre-compensation
  - Transmission rates of 1.25, 2.5, and 3.125 Gbaud (data rates of 1.0, 2.0, and 2.5 Gbps) per lane
  - Auto detection of 1- and 4-mode operation during port initialization
  - Link initialization and synchronization
  - Large and small size transport information field support selectable at initialization time
  - 34-bit addressing
  - Up to 256 bytes data payload
  - All transaction flows and priorities
  - Atomic set/clr/inc/dec for read-modify-write operations
  - Generation of IO_READ_HOME and FLUSH with data for accessing cache-coherent data at a remote memory system
  - Receiver-controlled flow control
  - Error detection, recovery, and time-out for packets and control symbols as required by the RapidIO specification
  - Register and register bit extensions as described in part VIII (Error Management) of the RapidIO specification
  - Hardware recovery only
  - Register support is not required for software-mediated error recovery.
  - Accept-all mode of operation for fail-over support
  - Support for RapidIO error injection
  - Internal LP-serial and application interface-level loopback modes
  - Memory and PHY BIST for at-speed production test
- RapidIO-compatible message unit
  - 4 Kbytes of payload per message
  - Up to sixteen 256-byte segments per message
  - Two inbound data message structures within the inbox
  - Capable of receiving three letters at any mailbox
  - Two outbound data message structures within the outbox
  - Capable of sending three letters simultaneously
  - Single segment multicast to up to 32 devIDs
  - Chaining and direct modes in the outbox

Table 1. Absolute Maximum Ratings [1] (continued)

Characteristic	Symbol	Max Value	Unit	Notes
Storage temperature range	T_{STG}	–55 to 150	°C	—

Notes:
1. Functional and tested operating conditions are given in Table 2. Absolute maximum ratings are stress ratings only, and functional operation at the maximums is not guaranteed. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.
2. The –0.3 to 2.75 V range is for DDR and –0.3 to 1.98 V range is for DDR2.
3. The 3.63 V maximum is only supported when the port is configured in GMII, MII, RMII, or TBI modes; otherwise the 2.75 V maximum applies. See Section 8.2, "FIFO, GMII, MII, TBI, RGMII, RMII, and RTBI AC Timing Specifications," for details on the recommended operating conditions per protocol.
4. (M,L,O)V_{IN} may overshoot/undershoot to a voltage and for a maximum duration as shown in Figure 2.

2.1.2 Recommended Operating Conditions

The following table provides the recommended operating conditions for this device. Note that the values in this table are the recommended and tested operating conditions. Proper device operation outside these conditions is not guaranteed.

Table 2. Recommended Operating Conditions

Characteristic		Symbol	Recommended Value	Unit	Notes
Core supply voltage		V_{DD}	1.1 V ± 55 mV	V	—
PLL supply voltage		AV_{DD}	1.1 V ± 55 mV	V	1
Core power supply for SerDes transceivers		SV_{DD}	1.1 V ± 55 mV	V	—
Pad power supply for SerDes transceivers		XV_{DD}	1.1 V ± 55 mV	V	—
DDR and DDR2 DRAM I/O voltage		GV_{DD}	2.5 V ± 125 mV 1.8 V ± 90 mV	V	—
Three-speed Ethernet I/O voltage		LV_{DD}	3.3 V ± 165 mV 2.5 V ± 125 mV	V	4
		TV_{DD}	3.3 V ± 165 mV 2.5 V ± 125 mV	—	4
PCI/PCI-X, DUART, system control and power management, I^2C, Ethernet MII management, and JTAG I/O voltage		OV_{DD}	3.3 V ± 165 mV	V	3
Local bus I/O voltage		BV_{DD}	3.3 V ± 165 mV 2.5 V ± 125 mV	V	—
Input voltage	DDR and DDR2 DRAM signals	MV_{IN}	GND to GV_{DD}	V	2
	DDR and DDR2 DRAM reference	MV_{REF}	GND to $GV_{DD}/2$	V	2
	Three-speed Ethernet signals	LV_{IN} TV_{IN}	GND to LV_{DD} GND to TV_{DD}	V	4
	Local bus signals	BV_{IN}	GND to BV_{DD}	V	—
	PCI, DUART, SYSCLK, system control and power management, I^2C, Ethernet MII management, and JTAG signals	OV_{IN}	GND to OV_{DD}	V	3

NOTE

From a system standpoint, if any of the I/O power supplies ramp prior to the V_{DD} core supply, the I/Os associated with that I/O supply may drive a logic one or zero during power-up, and extra current may be drawn by the device.

Table 19. DDR SDRAM Output AC Timing Specifications (continued)

At recommended operating conditions.

Parameter	Symbol[1]	Min	Max	Unit	Notes
MDQS epilogue end	t_{DDKHME}	–0.6	0.6	ns	6

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. Output hold time can be read as DDR timing (DD) from the rising or falling edge of the reference clock (KH or KL) until the output went invalid (AX or DX). For example, t_{DDKHAS} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes from the high (H) state until outputs (A) are setup (S) or output valid time. Also, t_{DDKLDX} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes low (L) until data outputs (D) are invalid (X) or data output hold time.
2. All MCK/$\overline{\text{MCK}}$ referenced measurements are made from the crossing of the two signals ±0.1 V.
3. ADDR/CMD includes all DDR SDRAM output signals except MCK/$\overline{\text{MCK}}$, $\overline{\text{MCS}}$, and MDQ/MECC/MDM/MDQS.
4. Note that t_{DDKHMH} follows the symbol conventions described in note 1. For example, t_{DDKHMH} describes the DDR timing (DD) from the rising edge of the MCK[*n*] clock (KH) until the MDQS signal is valid (MH). t_{DDKHMH} can be modified through control of the MDQS override bits (called WR_DATA_DELAY) in the TIMING_CFG_2 register. This is typically set to the same delay as in DDR_SDRAM_CLK_CNTL[CLK_ADJUST]. The timing parameters listed in the table assume that these 2 parameters have been set to the same adjustment value. See the *MPC8548E PowerQUICC III Integrated Processor Reference Manual* for a description and understanding of the timing modifications enabled by use of these bits.
5. Determined by maximum possible skew between a data strobe (MDQS) and any corresponding bit of data (MDQ), ECC (MECC), or data mask (MDM). The data strobe must be centered inside of the data eye at the pins of the microprocessor.
6. All outputs are referenced to the rising edge of MCK[*n*] at the pins of the microprocessor. Note that t_{DDKHMP} follows the symbol conventions described in note 1.

NOTE

For the ADDR/CMD setup and hold specifications in Table 19, it is assumed that the clock control register is set to adjust the memory clocks by 1/2 applied cycle.

Figure 3 shows the DDR SDRAM output timing for the MCK to MDQS skew measurement (t_{DDKHMH}).

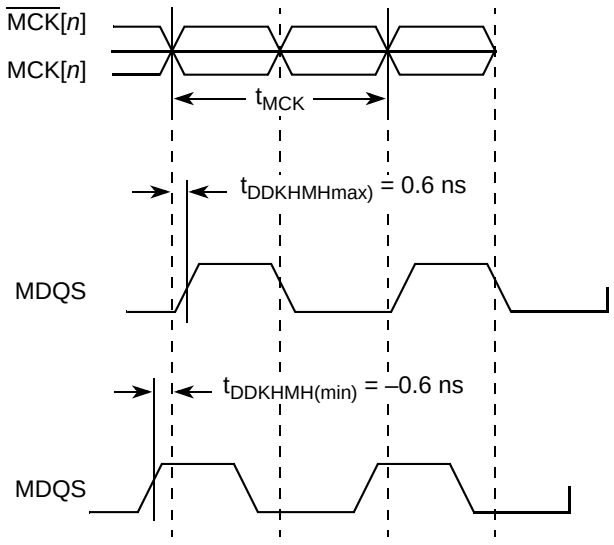

Figure 3. Timing Diagram for tDDKHMH

Figure 4 shows the DDR SDRAM output timing diagram.+

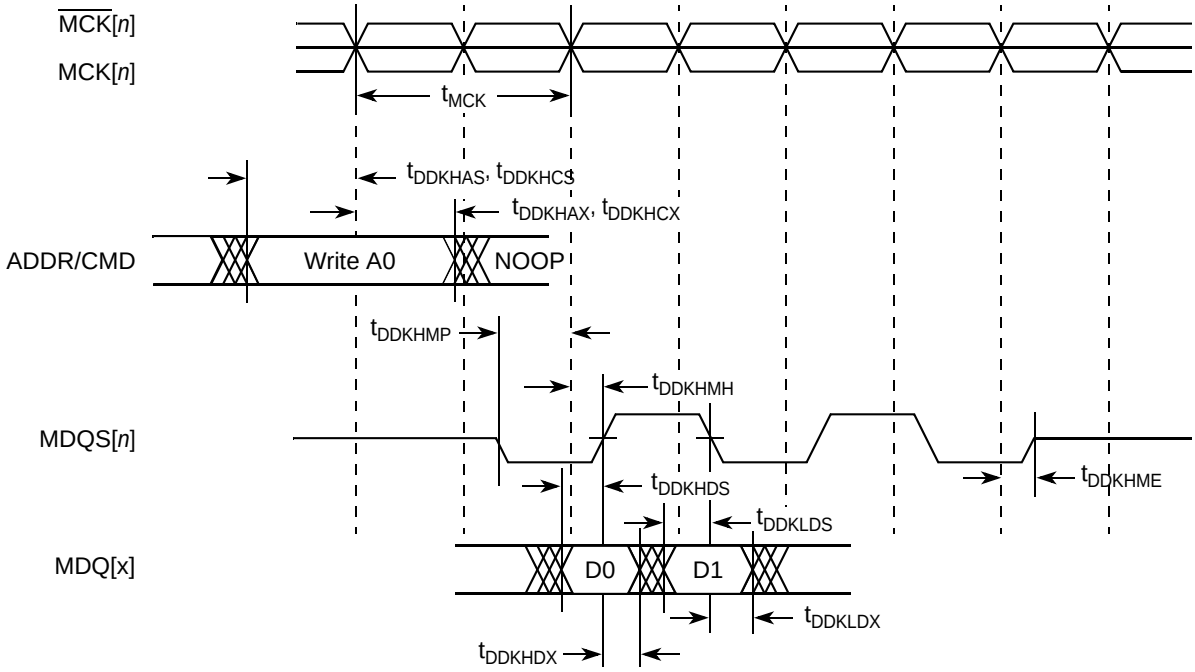

Figure 4. DDR SDRAM Output Timing Diagram

Figure 5 provides the AC test load for the DDR bus.

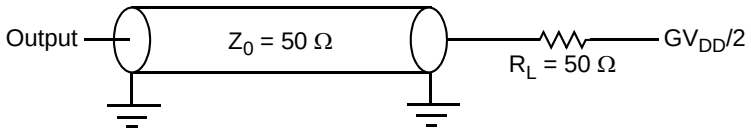

Figure 5. DDR AC Test Load

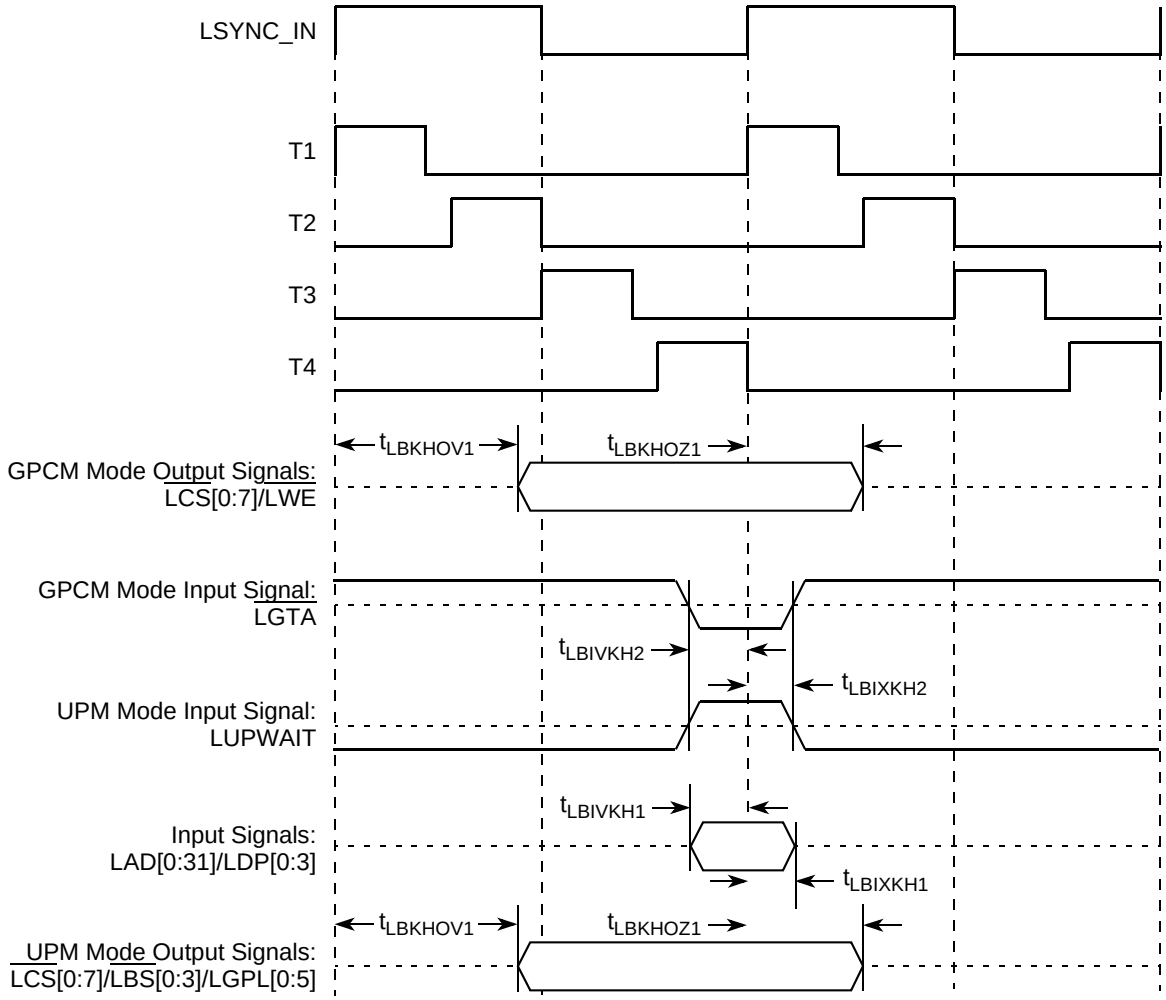

Figure 27. Local Bus Signals, GPCM/UPM Signals for LCCR[CLKDIV] = 8 or 16 (PLL Enabled)

14 GP_{OUT}/GP_{IN}

This section describes the DC and AC electrical specifications for the GP_{OUT}/GP_{IN} bus of the device.

14.1 GP_{OUT}/GP_{IN} Electrical Characteristics

Table 47 and Table 48 provide the DC electrical characteristics for the GP_{OUT} interface.

Table 47. GP_{OUT} DC Electrical Characteristics (3.3 V DC)

Parameter	Symbol	Min	Max	Unit
Supply voltage 3.3 V	BV_{DD}	3.13	3.47	V
High-level output voltage (BV_{DD} = min, I_{OH} = –2 mA)	V_{OH}	BV_{DD} – 0.2	—	V
Low-level output voltage (BV_{DD} = min, I_{OL} = 2 mA)	V_{OL}	—	0.2	V

Table 48. GP_{OUT} DC Electrical Characteristics (2.5 V DC)

Parameter	Symbol	Min	Max	Unit
Supply voltage 2.5 V	BV_{DD}	2.37	2.63	V
High-level output voltage (BV_{DD} = min, I_{OH} = –1 mA)	V_{OH}	2.0	BV_{DD} + 0.3	V
Low-level output voltage (BV_{DD} min, I_{OL} = 1 mA)	V_{OL}	GND – 0.3	0.4	V

Table 49 and Table 50 provide the DC electrical characteristics for the GP_{IN} interface.

Table 49. GP_{IN} DC Electrical Characteristics (3.3 V DC)

Parameter	Symbol	Min	Max	Unit
Supply voltage 3.3 V	BV_{DD}	3.13	3.47	V
High-level input voltage	V_{IH}	2	BV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	–0.3	0.8	V
Input current (BV_{IN} [1] = 0 V or BV_{IN} = BV_{DD})	I_{IN}	—	±5	μA

Note:

1. The symbol BV_{IN}, in this case, represents the BV_{IN} symbol referenced in Table 1.

— The input amplitude of the differential clock must be between 400 and 1600 mV differential peak-peak (or between 200 and 800 mV differential peak). In other words, each signal wire of the differential pair must have a single-ended swing less than 800 mV and greater than 200 mV. This requirement is the same for both external DC- or AC-coupled connection.

— For external DC-coupled connection, as described in Section 16.2.1, "SerDes Reference Clock Receiver Characteristics," the maximum average current requirements sets the requirement for average voltage (common mode voltage) to be between 100 and 400 mV. Figure 40 shows the SerDes reference clock input requirement for DC-coupled connection scheme.

— For external AC-coupled connection, there is no common mode voltage requirement for the clock driver. Since the external AC-coupling capacitor blocks the DC level, the clock driver and the SerDes reference clock receiver operate in different command mode voltages. The SerDes reference clock receiver in this connection scheme has its common mode voltage set to SGND_SRDS*n*. Each signal wire of the differential inputs is allowed to swing below and above the command mode voltage (SGND_SRDS*n*). Figure 41 shows the SerDes reference clock input requirement for AC-coupled connection scheme.

- Single-ended mode
  — The reference clock can also be single-ended. The SD_REF_CLK input amplitude (single-ended swing) must be between 400 and 800 mV peak-to-peak (from V_{min} to V_{max}) with $\overline{\text{SD\_REF\_CLK}}$ either left unconnected or tied to ground.
  — The SD_REF_CLK input average voltage must be between 200 and 400 mV. Figure 42 shows the SerDes reference clock input requirement for single-ended signaling mode.
  — To meet the input amplitude requirement, the reference clock inputs might need to be DC- or AC-coupled externally. For the best noise performance, the reference of the clock could be DC- or AC-coupled into the unused phase ($\overline{\text{SD\_REF\_CLK}}$) through the same source impedance as the clock input (SD_REF_CLK) in use.

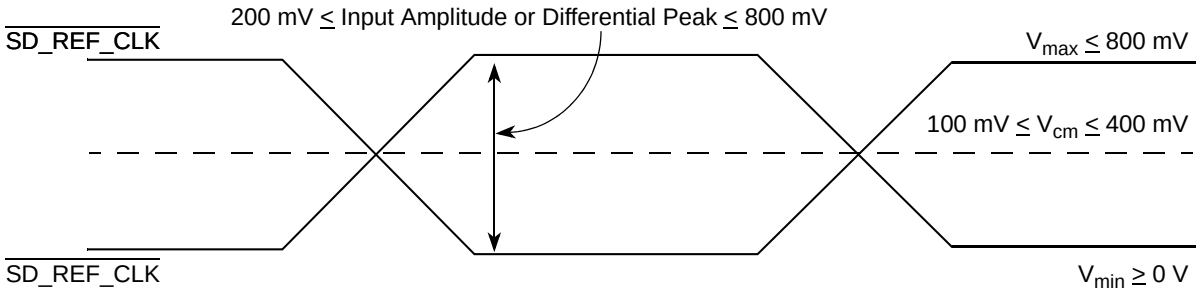

Figure 40. Differential Reference Clock Input DC Requirements (External DC-Coupled)

Table 56. Differential Transmitter (TX) Output Specifications

Symbol	Parameter	Min	Nom	Max	Unit	Comments
UI	Unit interval	399.88	400	400.12	ps	Each UI is 400 ps ± 300 ppm. UI does not account for spread spectrum clock dictated variations. See Note 1.
$V_{TX-DIFFp-p}$	Differential peak-to-peak output voltage	0.8	—	1.2	V	$V_{TX-DIFFp-p} = 2 \times \lvert V_{TX-D+} - V_{TX-D-}\rvert$. See Note 2.
$V_{TX-DE-RATIO}$	De- emphasized differential output voltage (ratio)	–3.0	–3.5	–4.0	dB	Ratio of the $V_{TX-DIFFp-p}$ of the second and following bits after a transition divided by the $V_{TX-DIFFp-p}$ of the first bit after a transition. See Note 2.
T_{TX-EYE}	Minimum TX eye width	0.70	—	—	UI	The maximum transmitter jitter can be derived as $T_{TX-MAX-JITTER} = 1 - T_{TX-EYE} = 0.3$ UI. See Notes 2 and 3.
$T_{TX-EYE-MEDIAN-to-MAX-JITTER}$	Maximum time between the jitter median and maximum deviation from the median.	—	—	0.15	UI	Jitter is defined as the measurement variation of the crossing points ($V_{TX-DIFFp-p} = 0$ V) in relation to a recovered TX UI. A recovered TX UI is calculated over 3500 consecutive unit intervals of sample data. Jitter is measured using all edges of the 250 consecutive UI in the center of the 3500 UI used for calculating the TX UI. See Notes 2 and 3.
$T_{TX-RISE}$, $T_{TX-FALL}$	D+/D– TX output rise/fall time	0.125	—	—	UI	See Notes 2 and 5.
$V_{TX-CM-ACp}$	RMS AC peak common mode output voltage	—	—	20	mV	$V_{TX-CM-ACp} = RMS(\lvert V_{TXD+} + V_{TXD-}\rvert/2 - V_{TX-CM-DC})$ $V_{TX-CM-DC} = DC_{(avg)}$ of $\lvert V_{TX-D+} + V_{TX-D-}\rvert/2$. See Note 2.
$V_{TX-CM-DC-ACTIVE-IDLE-DELTA}$	Absolute delta of dc common mode voltage during L0 and electrical idle	0	—	100	mV	$\lvert V_{TX-CM-DC\ (during\ L0)} + V_{TX-CM-Idle-DC\ (during\ electrical\ idle)}\rvert \le 100$ mV $V_{TX-CM-DC} = DC_{(avg)}$ of $\lvert V_{TX-D+} + V_{TX-D-}\rvert/2$ [L0] $V_{TX-CM-Idle-DC} = DC_{(avg)}$ of $\lvert V_{TX-D+} + V_{TX-D-}\rvert/2$ [electrical idle] See Note 2.
$V_{TX-CM-DC-LINE-DELTA}$	Absolute delta of DC common mode between D+ and D–	0	—	25	mV	$\lvert V_{TX-CM-DC-D+} - V_{TX-CM-DC-D-}\rvert \le 25$ mV $V_{TX-CM-DC-D+} = DC_{(avg)}$ of $\lvert V_{TX-D+}\rvert$ $V_{TX-CM-DC-D-} = DC_{(avg)}$ of $\lvert V_{TX-D-}\rvert$. See Note 2.
$V_{TX-IDLE-DIFFp}$	Electrical idle differential peak output voltage	0	—	20	mV	$V_{TX-IDLE-DIFFp} = \lvert V_{TX-IDLE-D+} - V_{TX-IDLE-D-}\rvert \le 20$ mV. See Note 2.
$V_{TX-RCV-DETECT}$	The amount of voltage change allowed during receiver detection	—	—	600	mV	The total amount of voltage change that a transmitter can apply to sense whether a low impedance receiver is present. See Note 6.

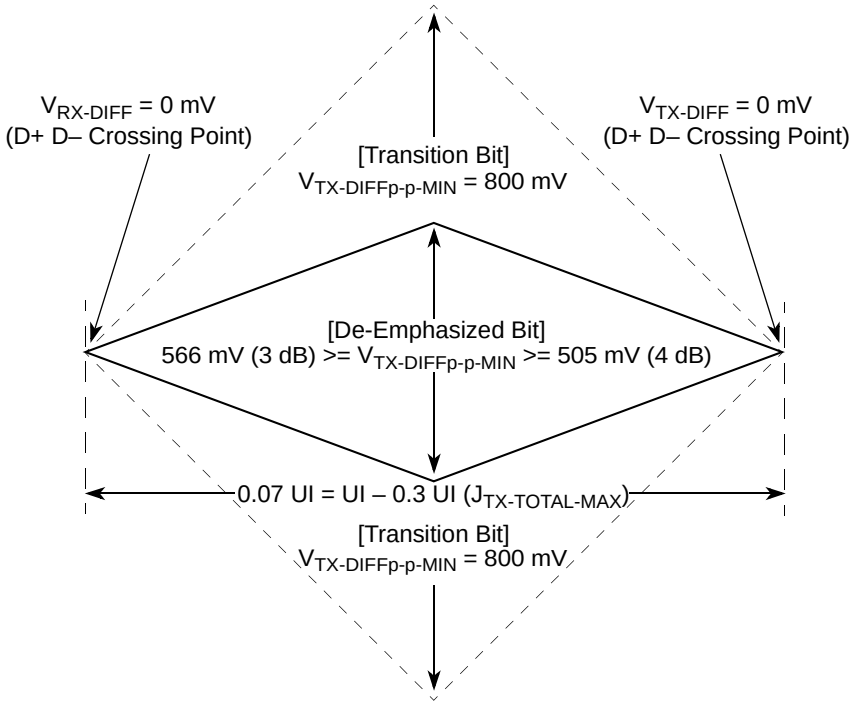

Figure 48. Minimum Transmitter Timing and Voltage Output Compliance Specifications

17.4.3 Differential Receiver (RX) Input Specifications

Table 57 defines the specifications for the differential input at all receivers (RXs). The parameters are specified at the component pins.

Table 57. Differential Receiver (RX) Input Specifications

Symbol	Parameter	Min	Nom	Max	Unit	Comments
UI	Unit interval	399.88	400	400.12	ps	Each UI is 400 ps ± 300 ppm. UI does not account for spread spectrum clock dictated variations. See Note 1.
$V_{RX-DIFFp-p}$	Differential peak-to-peak input voltage	0.175	—	1.200	V	$V_{RX-DIFFp-p} = 2 \times \lvert V_{RX-D+} - V_{RX-D-}\rvert$. See Note 2.
T_{RX-EYE}	Minimum receiver eye width	0.4	—	—	UI	The maximum interconnect media and transmitter jitter that can be tolerated by the receiver can be derived as $T_{RX-MAX-JITTER} = 1 - T_{RX-EYE} = 0.6$ UI. See Notes 2 and 3.
$T_{RX-EYE-MEDIAN-to-MAX-JITTER}$	Maximum time between the jitter median and maximum deviation from the median	—	—	0.3	UI	Jitter is defined as the measurement variation of the crossing points ($V_{RX-DIFFp-p}$ = 0 V) in relation to a recovered TX UI. A recovered TX UI is calculated over 3500 consecutive unit intervals of sample data. Jitter is measured using all edges of the 250 consecutive UI in the center of the 3500 UI used for calculating the TX UI. See Notes 2, 3, and 7.

Table 68. Receiver AC Timing Specifications—3.125 GBaud

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Differential input voltage	V_{IN}	200	1600	mVp-p	Measured at receiver
Deterministic jitter tolerance	J_D	0.37	—	UI p-p	Measured at receiver
Combined deterministic and random jitter tolerance	J_{DR}	0.55	—	UI p-p	Measured at receiver
Total jitter tolerance[1]	J_T	0.65	—	UI p-p	Measured at receiver
Multiple input skew	S_{MI}	—	22	ns	Skew at the receiver input between lanes of a multilane link
Bit error rate	BER	—	10^{-12}		—
Unit interval	UI	320	320	ps	±100 ppm

Note:
1. Total jitter is composed of three components, deterministic jitter, random jitter and single frequency sinusoidal jitter. The sinusoidal jitter may have any amplitude and frequency in the unshaded region of Figure 53. The sinusoidal jitter component is included to ensure margin for low frequency jitter, wander, noise, crosstalk and other variable system effects.

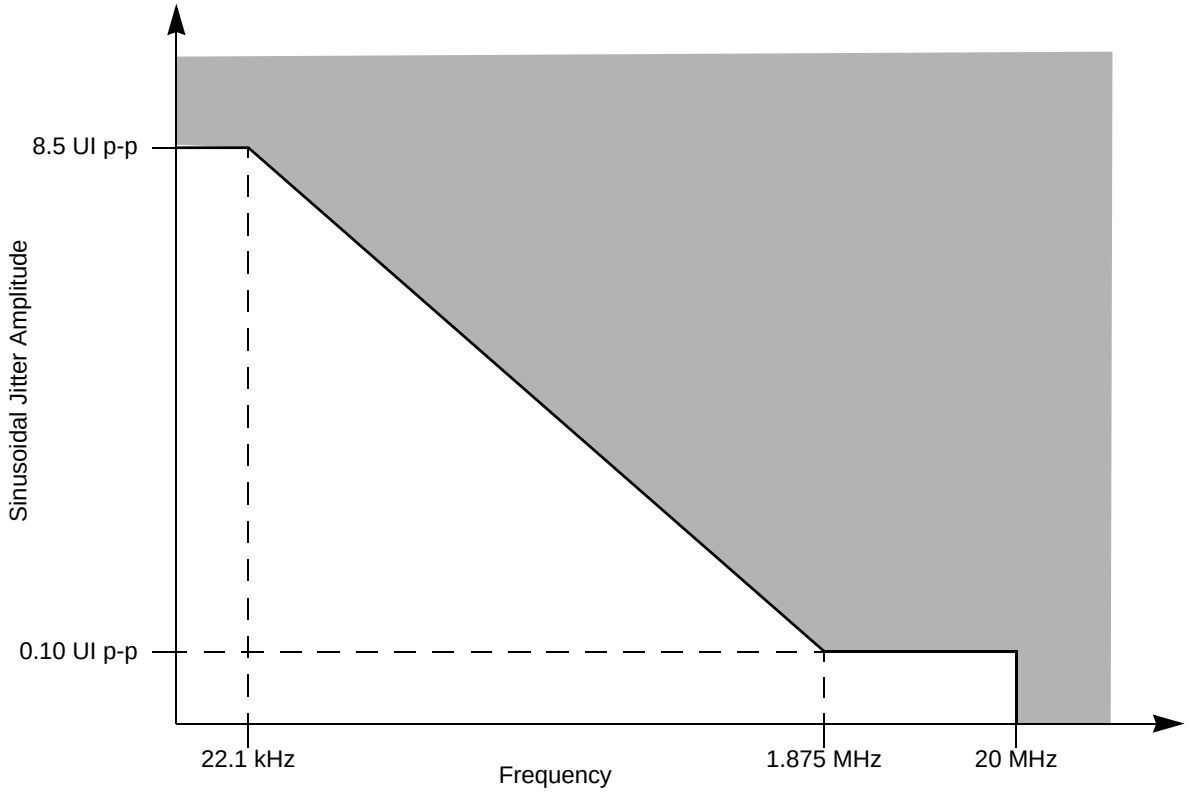

Figure 53. Single Frequency Sinusoidal Jitter Limits

level must always be equivalent to V_{DD}, and preferably these voltages are derived directly from V_{DD} through a low frequency filter scheme such as the following.

There are a number of ways to reliably provide power to the PLLs, but the recommended solution is to provide independent filter circuits per PLL power supply as illustrated in Figure 57, one to each of the AV_{DD} pins. By providing independent filters to each PLL the opportunity to cause noise injection from one PLL to the other is reduced.

This circuit is intended to filter noise in the PLLs resonant frequency range from a 500 kHz to 10 MHz range. It must be built with surface mount capacitors with minimum Effective Series Inductance (ESL). Consistent with the recommendations of Dr. Howard Johnson in *High Speed Digital Design: A Handbook of Black Magic* (Prentice Hall, 1993), multiple small capacitors of equal value are recommended over a single large value capacitor.

Each circuit must be placed as close as possible to the specific AV_{DD} pin being supplied to minimize noise coupled from nearby circuits. It must be routed directly from the capacitors to the AV_{DD} pin, which is on the periphery of the footprint, without the inductance of vias.

Figure 57 through Figure 59 shows the PLL power supply filter circuits.

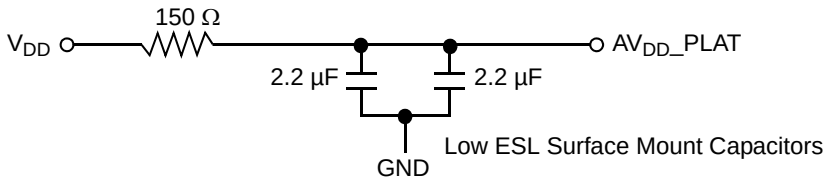

Figure 57. PLL Power Supply Filter Circuit with PLAT Pins

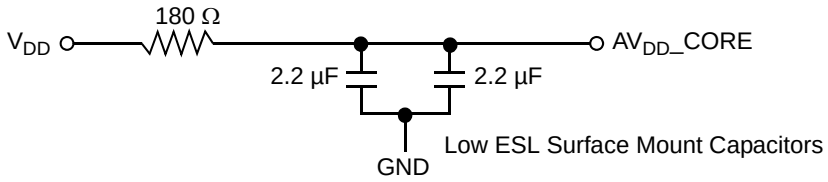

Figure 58. PLL Power Supply Filter Circuit with CORE Pins

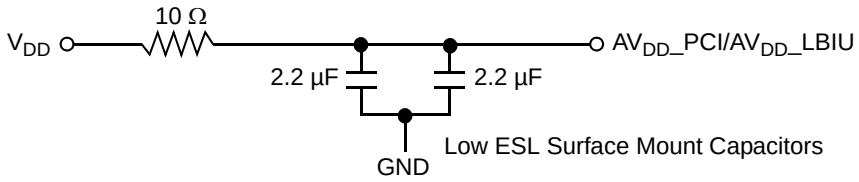

Figure 59. PLL Power Supply Filter Circuit with PCI/LBIU Pins

The AV_{DD}_SRDS signal provides power for the analog portions of the SerDes PLL. To ensure stability of the internal clock, the power supplied to the PLL is filtered using a circuit similar to the one shown in following figure. For maximum effectiveness, the filter circuit is placed as closely as possible to the AV_{DD}_SRDS ball to ensure it filters out as much noise as possible. The ground connection must be near the AV_{DD}_SRDS ball. The 0.003-µF capacitor is closest to the ball, followed by the two 2.2 µF capacitors, and finally the 1 Ω resistor to the board supply plane. The capacitors are connected from AV_{DD}_SRDS to

The platform PLL ratio and e500 PLL ratio configuration pins are not equipped with these default pull-up devices.

22.9 JTAG Configuration Signals

Correct operation of the JTAG interface requires configuration of a group of system control pins as demonstrated in Figure 63. Care must be taken to ensure that these pins are maintained at a valid deasserted state under normal operating conditions as most have asynchronous behavior and spurious assertion gives unpredictable results.

Boundary-scan testing is enabled through the JTAG interface signals. The $\overline{\text{TRST}}$ signal is optional in the IEEE 1149.1 specification, but it is provided on all processors built on Power Architecture technology. The device requires $\overline{\text{TRST}}$ to be asserted during power-on reset flow to ensure that the JTAG boundary logic does not interfere with normal chip operation. While the TAP controller can be forced to the reset state using only the TCK and TMS signals, generally systems assert $\overline{\text{TRST}}$ during the power-on reset flow. Simply tying $\overline{\text{TRST}}$ to $\overline{\text{HRESET}}$ is not practical because the JTAG interface is also used for accessing the common on-chip processor (COP), which implements the debug interface to the chip.

The COP function of these processors allow a remote computer system (typically, a PC with dedicated hardware and debugging software) to access and control the internal operations of the processor. The COP interface connects primarily through the JTAG port of the processor, with some additional status monitoring signals. The COP port requires the ability to independently assert $\overline{\text{HRESET}}$ or $\overline{\text{TRST}}$ in order to fully control the processor. If the target system has independent reset sources, such as voltage monitors, watchdog timers, power supply failures, or push-button switches, then the COP reset signals must be merged into these signals with logic.

The arrangement shown in Figure 63 allows the COP port to independently assert $\overline{\text{HRESET}}$ or $\overline{\text{TRST}}$, while ensuring that the target can drive $\overline{\text{HRESET}}$ as well.

The COP interface has a standard header, shown in Figure 62, for connection to the target system, and is based on the 0.025" square-post, 0.100" centered header assembly (often called a Berg header). The connector typically has pin 14 removed as a connector key.

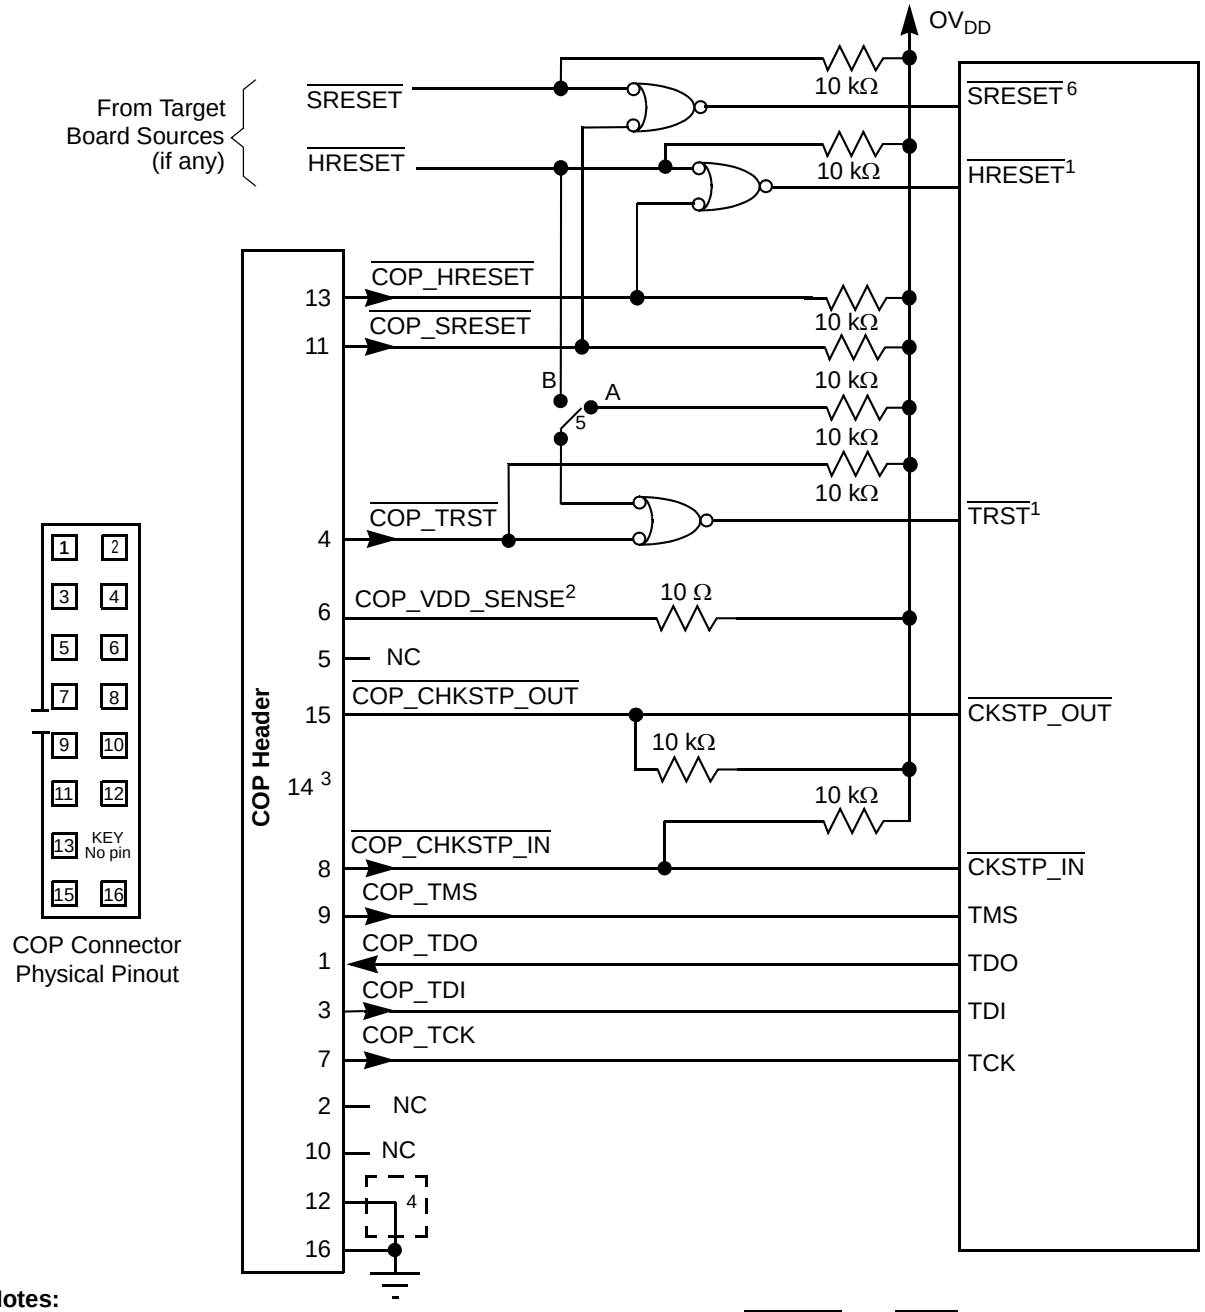
The COP header adds many benefits such as breakpoints, watchpoints, register and memory examination/modification, and other standard debugger features. An inexpensive option can be to leave the COP header unpopulated until needed.

There is no standardized way to number the COP header; so emulator vendors have issued many different pin numbering schemes. Some COP headers are numbered top-to-bottom then left-to-right, while others use left-to-right then top-to-bottom. Still others number the pins counter-clockwise from pin 1 (as with an IC). Regardless of the numbering scheme, the signal placement recommended in Figure 62 is common to all known emulators.

22.9.1 Termination of Unused Signals

Freescale recommends the following connections, when the JTAG interface and COP header are not used:

- $\overline{\text{TRST}}$ must be tied to $\overline{\text{HRESET}}$ through a 0 kΩ isolation resistor so that it is asserted when the system reset signal ($\overline{\text{HRESET}}$) is asserted, ensuring that the JTAG scan chain is initialized during the power-on reset flow. Freescale recommends that the COP header be designed into the system



Notes:

1. The COP port and target board must be able to independently assert $\overline{\text{HRESET}}$ and $\overline{\text{TRST}}$ to the processor in order to fully control the processor as shown here.
2. Populate this with a 10–Ω resistor for short-circuit/current-limiting protection.
3. The KEY location (pin 14) is not physically present on the COP header.
4. Although pin 12 is defined as a No-Connect, some debug tools may use pin 12 as an additional GND pin for improved signal integrity.
5. This switch is included as a precaution for BSDL testing. The switch must be closed to position A during BSDL testing to avoid accidentally asserting the $\overline{\text{TRST}}$ line. If BSDL testing is not being performed, this switch must be closed to position B.
6. Asserting $\overline{\text{SRESET}}$ causes a machine check interrupt to the e500 core.

Figure 63. JTAG Interface Connection
