

Welcome to [E-XFL.COM](#)

Understanding [Embedded - Microprocessors](#)

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of [Embedded - Microprocessors](#)

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details

Product Status	Obsolete
Core Processor	PowerPC e500
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	1.0GHz
Co-Processors/DSP	Signal Processing; SPE, Security; SEC
RAM Controllers	DDR, DDR2, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (4)
SATA	-
USB	-
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	Cryptography, Random Number Generator
Package / Case	783-BBGA, FCBGA
Supplier Device Package	783-FCBGA (29x29)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc8548evuaqg

- Up to 32 simultaneous open pages for DDR2
- Contiguous or discontiguous memory mapping
- Read-modify-write support for RapidIO atomic increment, decrement, set, and clear transactions
- Sleep mode support for self-refresh SDRAM
- On-die termination support when using DDR2
- Supports auto refreshing
- On-the-fly power management using CKE signal
- Registered DIMM support
- Fast memory access via JTAG port
- 2.5-V SSTL_2 compatible I/O (1.8-V SSTL_1.8 for DDR2)
- Support for battery-backed main memory
- Programmable interrupt controller (PIC)
 - Programming model is compliant with the OpenPIC architecture.
 - Supports 16 programmable interrupt and processor task priority levels
 - Supports 12 discrete external interrupts
 - Supports 4 message interrupts with 32-bit messages
 - Supports connection of an external interrupt controller such as the 8259 programmable interrupt controller
 - Four global high-resolution timers/counters that can generate interrupts
 - Supports a variety of other internal interrupt sources
 - Supports fully nested interrupt delivery
 - Interrupts can be routed to external pin for external processing.
 - Interrupts can be routed to the e500 core's standard or critical interrupt inputs.
 - Interrupt summary registers allow fast identification of interrupt source.
- Integrated security engine (SEC) optimized to process all the algorithms associated with IPSec, IKE, WTLS/WAP, SSL/TLS, and 3GPP
 - Four crypto-channels, each supporting multi-command descriptor chains
 - Dynamic assignment of crypto-execution units via an integrated controller
 - Buffer size of 256 bytes for each execution unit, with flow control for large data sizes
 - PKEU—public key execution unit
 - RSA and Diffie-Hellman; programmable field size up to 2048 bits
 - Elliptic curve cryptography with F_2m and $F(p)$ modes and programmable field size up to 511 bits
 - DEU—Data Encryption Standard execution unit
 - DES, 3DES
 - Two key (K1, K2) or three key (K1, K2, K3)
 - ECB and CBC modes for both DES and 3DES

- VRRP and HSRP support for seamless router fail-over
 - Up to 16 exact-match MAC addresses supported
 - Broadcast address (accept/reject)
 - Hash table match on up to 512 multicast addresses
 - Promiscuous mode
- Buffer descriptors backward compatible with MPC8260 and MPC860T 10/100 Ethernet programming models
- RMON statistics support
- 10-Kbyte internal transmit and 2-Kbyte receive FIFOs
- MII management interface for control and status
- Ability to force allocation of header information and buffer descriptors into L2 cache
- OCeaN switch fabric
 - Full crossbar packet switch
 - Reorders packets from a source based on priorities
 - Reorders packets to bypass blocked packets
 - Implements starvation avoidance algorithms
 - Supports packets with payloads of up to 256 bytes
- Integrated DMA controller
 - Four-channel controller
 - All channels accessible by both the local and remote masters
 - Extended DMA functions (advanced chaining and striding capability)
 - Support for scatter and gather transfers
 - Misaligned transfer capability
 - Interrupt on completed segment, link, list, and error
 - Supports transfers to or from any local memory or I/O port
 - Selectable hardware-enforced coherency (snoop/no snoop)
 - Ability to start and flow control each DMA channel from external 3-pin interface
 - Ability to launch DMA from single write transaction
- Two PCI/PCI-X controllers
 - PCI 2.2 and PCI-X 1.0 compatible
 - One 32-/64-bit PCI/PCI-X port with support for speeds of up to 133 MHz (maximum PCI-X frequency in synchronous mode is 110 MHz)
 - One 32-bit PCI port with support for speeds from 16 to 66 MHz (available when the other port is in 32-bit mode)
 - Host and agent mode support
 - 64-bit dual address cycle (DAC) support
 - PCI-X supports multiple split transactions
 - Supports PCI-to-memory and memory-to-PCI streaming

Figure 24. Local Bus Signals (PLL Bypass Mode)

NOTE

In PLL bypass mode, LCLK[n] is the inverted version of the internal clock with the delay of t_{LBKHK1} . In this mode, signals are launched at the rising edge of the internal clock and are captured at falling edge of the internal clock with the exception of \overline{LGTA} /LUPWAIT (which is captured on the rising edge of the internal clock).

14 GP_{OUT}/GP_{IN}

This section describes the DC and AC electrical specifications for the GP_{OUT}/GP_{IN} bus of the device.

14.1 GP_{OUT}/GP_{IN} Electrical Characteristics

Table 47 and Table 48 provide the DC electrical characteristics for the GP_{OUT} interface.

Table 47. GP_{OUT} DC Electrical Characteristics (3.3 V DC)

Parameter	Symbol	Min	Max	Unit
Supply voltage 3.3 V	BV _{DD}	3.13	3.47	V
High-level output voltage (BV _{DD} = min, I _{OH} = -2 mA)	V _{OH}	BV _{DD} - 0.2	—	V
Low-level output voltage (BV _{DD} = min, I _{OL} = 2 mA)	V _{OL}	—	0.2	V

Table 48. GP_{OUT} DC Electrical Characteristics (2.5 V DC)

Parameter	Symbol	Min	Max	Unit
Supply voltage 2.5 V	BV _{DD}	2.37	2.63	V
High-level output voltage (BV _{DD} = min, I _{OH} = -1 mA)	V _{OH}	2.0	BV _{DD} + 0.3	V
Low-level output voltage (BV _{DD} min, I _{OL} = 1 mA)	V _{OL}	GND - 0.3	0.4	V

Table 49 and Table 50 provide the DC electrical characteristics for the GP_{IN} interface.

Table 49. GP_{IN} DC Electrical Characteristics (3.3 V DC)

Parameter	Symbol	Min	Max	Unit
Supply voltage 3.3 V	BV _{DD}	3.13	3.47	V
High-level input voltage	V _{IH}	2	BV _{DD} + 0.3	V
Low-level input voltage	V _{IL}	-0.3	0.8	V
Input current (BV _{IN} ¹ = 0 V or BV _{IN} = BV _{DD})	I _{IN}	—	±5	μA

Note:

1. The symbol BV_{IN}, in this case, represents the BV_{IN} symbol referenced in Table 1.

16 High-Speed Serial Interfaces (HSSI)

The device features one Serializer/Deserializer (SerDes) interface to be used for high-speed serial interconnect applications. The SerDes interface can be used for PCI Express and/or serial RapidIO data transfers.

This section describes the common portion of SerDes DC electrical specifications, which is the DC requirement for SerDes reference clocks. The SerDes data lane's transmitter and receiver reference circuits are also shown.

16.1 Signal Terms Definition

The SerDes utilizes differential signaling to transfer data across the serial link. This section defines terms used in the description and specification of differential signals.

Figure 38 shows how the signals are defined. For illustration purpose, only one SerDes lane is used for the description. The figure shows a waveform for either a transmitter output (SD_TX and $\overline{\text{SD_TX}}$) or a receiver input (SD_RX and $\overline{\text{SD_RX}}$). Each signal swings between A volts and B volts where $A > B$.

Using this waveform, the definitions are as follows. To simplify the illustration, the following definitions assume that the SerDes transmitter and receiver operate in a fully symmetrical differential signaling environment.

- **Single-ended swing**
The transmitter output signals and the receiver input signals SD_TX , $\overline{\text{SD_TX}}$, SD_RX and $\overline{\text{SD_RX}}$ each have a peak-to-peak swing of $A - B$ volts. This is also referred as each signal wire's single-ended swing.
- **Differential output voltage, V_{OD} (or differential output swing):**
The differential output voltage (or swing) of the transmitter, V_{OD} , is defined as the difference of the two complimentary output voltages: $V_{\text{SD_TX}} - V_{\overline{\text{SD_TX}}}$. The V_{OD} value can be either positive or negative.
- **Differential input voltage, V_{ID} (or differential input swing):**
The differential input voltage (or swing) of the receiver, V_{ID} , is defined as the difference of the two complimentary input voltages: $V_{\text{SD_RX}} - V_{\overline{\text{SD_RX}}}$. The V_{ID} value can be either positive or negative.
- **Differential peak voltage, V_{DIFFp}**
The peak value of the differential transmitter output signal or the differential receiver input signal is defined as differential peak voltage, $V_{\text{DIFFp}} = |A - B|$ volts.
- **Differential peak-to-peak, $V_{\text{DIFFp-p}}$**
Because the differential output signal of the transmitter and the differential input signal of the receiver each range from $A - B$ to $-(A - B)$ volts, the peak-to-peak value of the differential transmitter output signal or the differential receiver input signal is defined as differential peak-to-peak voltage, $V_{\text{DIFFp-p}} = 2 \times V_{\text{DIFFp}} = 2 \times |A - B|$ volts, which is twice of differential swing in amplitude, or twice of the differential peak. For example, the output differential peak-to-peak voltage can also be calculated as $V_{\text{TX-DIFFp-p}} = 2 \times |V_{\text{OD}}|$.
- **Common mode voltage, V_{cm}**
The common mode voltage is equal to one half of the sum of the voltages between each conductor

of a balanced interchange circuit and ground. In this example, for SerDes output, $V_{cm_out} = V_{SD_TX} + V_{\overline{SD_TX}} = (A + B)/2$, which is the arithmetic mean of the two complimentary output voltages within a differential pair. In a system, the common mode voltage may often differ from one component's output to the other's input. Sometimes, it may be even different between the receiver input and driver output circuits within the same component. It is also referred to as the DC offset.

Figure 38. Differential Voltage Definitions for Transmitter or Receiver

To illustrate these definitions using real values, consider the case of a CML (current mode logic) transmitter that has a common mode voltage of 2.25 V and each of its outputs, TD and \overline{TD} , has a swing that goes between 2.5 and 2.0 V. Using these values, the peak-to-peak voltage swing of each signal (TD or \overline{TD}) is 500 mVp-p, which is referred as the single-ended swing for each signal. In this example, since the differential signaling environment is fully symmetrical, the transmitter output's differential swing (V_{OD}) has the same amplitude as each signal's single-ended swing. The differential output signal ranges between 500 and -500 mV, in other words, V_{OD} is 500 mV in one phase and -500 mV in the other phase. The peak differential voltage (V_{DIFFp}) is 500 mV. The peak-to-peak differential voltage (V_{DIFFpp}) is 1000 mVp-p.

16.2 SerDes Reference Clocks

The SerDes reference clock inputs are applied to an internal PLL whose output creates the clock used by the corresponding SerDes lanes. The SerDes reference clocks inputs are SD_REF_CLK and $\overline{SD_REF_CLK}$ for PCI Express and serial RapidIO.

The following sections describe the SerDes reference clock requirements and some application information.

16.2.1 SerDes Reference Clock Receiver Characteristics

Figure 39 shows a receiver reference diagram of the SerDes reference clocks.

- The supply voltage requirements for XV_{DD_SRDS2} are specified in Table 1 and Table 2.
- SerDes Reference clock receiver reference circuit structure:

- The input amplitude of the differential clock must be between 400 and 1600 mV differential peak-peak (or between 200 and 800 mV differential peak). In other words, each signal wire of the differential pair must have a single-ended swing less than 800 mV and greater than 200 mV. This requirement is the same for both external DC- or AC-coupled connection.
- For external DC-coupled connection, as described in [Section 16.2.1, “SerDes Reference Clock Receiver Characteristics,”](#) the maximum average current requirements sets the requirement for average voltage (common mode voltage) to be between 100 and 400 mV. [Figure 40](#) shows the SerDes reference clock input requirement for DC-coupled connection scheme.
- For external AC-coupled connection, there is no common mode voltage requirement for the clock driver. Since the external AC-coupling capacitor blocks the DC level, the clock driver and the SerDes reference clock receiver operate in different command mode voltages. The SerDes reference clock receiver in this connection scheme has its common mode voltage set to SGND_SRDS_n. Each signal wire of the differential inputs is allowed to swing below and above the command mode voltage (SGND_SRDS_n). [Figure 41](#) shows the SerDes reference clock input requirement for AC-coupled connection scheme.
- Single-ended mode
 - The reference clock can also be single-ended. The SD_REF_CLK input amplitude (single-ended swing) must be between 400 and 800 mV peak-to-peak (from V_{\min} to V_{\max}) with SD_REF_CLK either left unconnected or tied to ground.
 - The SD_REF_CLK input average voltage must be between 200 and 400 mV. [Figure 42](#) shows the SerDes reference clock input requirement for single-ended signaling mode.
 - To meet the input amplitude requirement, the reference clock inputs might need to be DC- or AC-coupled externally. For the best noise performance, the reference of the clock could be DC- or AC-coupled into the unused phase (SD_REF_CLK) through the same source impedance as the clock input (SD_REF_CLK) in use.

Figure 40. Differential Reference Clock Input DC Requirements (External DC-Coupled)

18.3 Signal Definitions

LP-serial links use differential signaling. This section defines terms used in the description and specification of differential signals. Figure 51 shows how the signals are defined. The figures show waveforms for either a transmitter output (TD and $\overline{\text{TD}}$) or a receiver input (RD and $\overline{\text{RD}}$). Each signal swings between A volts and B volts where $A > B$. Using these waveforms, the definitions are as follows:

1. The transmitter output signals and the receiver input signals TD, $\overline{\text{TD}}$, RD, and $\overline{\text{RD}}$ each have a peak-to-peak swing of $A - B$ volts.
2. The differential output signal of the transmitter, V_{OD} , is defined as $V_{\text{TD}} - V_{\overline{\text{TD}}}$.
3. The differential input signal of the receiver, V_{ID} , is defined as $V_{\text{RD}} - V_{\overline{\text{RD}}}$.
4. The differential output signal of the transmitter and the differential input signal of the receiver each range from $A - B$ to $-(A - B)$ volts.
5. The peak value of the differential transmitter output signal and the differential receiver input signal is $A - B$ volts.
6. The peak-to-peak value of the differential transmitter output signal and the differential receiver input signal is $2 \times (A - B)$ volts.

Figure 51. Differential Peak-Peak Voltage of Transmitter or Receiver

To illustrate these definitions using real values, consider the case of a CML (current mode logic) transmitter that has a common mode voltage of 2.25 V and each of its outputs, TD and $\overline{\text{TD}}$, has a swing that goes between 2.5 and 2.0 V. Using these values, the peak-to-peak voltage swing of the signals TD and $\overline{\text{TD}}$ is 500 mVp-p. The differential output signal ranges between 500 and -500 mV. The peak differential voltage is 500 mV. The peak-to-peak differential voltage is 1000 mVp-p.

18.4 Equalization

With the use of high-speed serial links, the interconnect media causes degradation of the signal at the receiver. Effects such as inter-symbol interference (ISI) or data dependent jitter are produced. This loss can be large enough to degrade the eye opening at the receiver beyond what is allowed in the specification. To negate a portion of these effects, equalization can be used. The most common equalization techniques that can be used are:

- A passive high pass filter network placed at the receiver. This is often referred to as passive equalization.
- The use of active circuits in the receiver. This is often referred to as adaptive equalization.

18.5 Explanatory Note on Transmitter and Receiver Specifications

AC electrical specifications are given for transmitter and receiver. Long- and short-run interfaces at three baud rates (a total of six cases) are described.

The parameters for the AC electrical specifications are guided by the XAUI electrical interface specified in Clause 47 of IEEE 802.3ae-2002.

XAUI has similar application goals to Serial RapidIO, as described in Section 8.1. The goal of this standard is that electrical designs for Serial RapidIO can reuse electrical designs for XAUI, suitably modified for applications at the baud intervals and reaches described herein.

18.6 Transmitter Specifications

LP-serial transmitter electrical and timing specifications are stated in the text and tables of this section.

The differential return loss, S_{11} , of the transmitter in each case shall be better than:

- -10 dB for $(\text{baud frequency})/10 < \text{Freq}(f) < 625$ MHz, and
- -10 dB + $10\log(f/625 \text{ MHz})$ dB for $625 \text{ MHz} \leq \text{Freq}(f) \leq \text{baud frequency}$

The reference impedance for the differential return loss measurements is $100\text{-}\Omega$ resistive. Differential return loss includes contributions from on-chip circuitry, chip packaging, and any off-chip components related to the driver. The output impedance requirement applies to all valid output levels.

It is recommended that the 20%–80% rise/fall time of the transmitter, as measured at the transmitter output, in each case have a minimum value 60 ps.

It is recommended that the timing skew at the output of an LP-serial transmitter between the two signals that comprise a differential pair not exceed 25 ps at 1.25 GB, 20 ps at 2.50 GB, and 15 ps at 3.125 GB.

Table 59. Short Run Transmitter AC Timing Specifications—1.25 GBaud

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Output voltage	V_O	−0.40	2.30	V	Voltage relative to COMMON of either signal comprising a differential pair
Differential output voltage	V_{DIFFPP}	500	1000	mV p-p	—
Deterministic jitter	J_D	—	0.17	UI p-p	—
Total jitter	J_T	—	0.35	UI p-p	—
Multiple output skew	S_{MO}	—	1000	ps	Skew at the transmitter output between lanes of a multilane link
Unit Interval	UI	800	800	ps	± 100 ppm

19.3 Pinout Listings

NOTE

The $\overline{\text{DMA_DACK}}[0:1]$ and $\overline{\text{TEST_SEL}}/\overline{\text{TEST_SEL}}$ pins must be set to a proper state during POR configuration. See the pinlist table of the individual device for more details.

For MPC8548/47/45, GPIOs are still available on $\text{PCI1_AD}[63:32]/\text{PC2_AD}[31:0]$ pins if they are not used for PCI functionality.

For MPC8545/43, eTSEC does not support 16 bit FIFO mode.

Table 71 provides the pinout listing for the MPC8548E 783 FC-PBGA package.

Table 71. MPC8548E Pinout Listing

Signal	Package Pin Number	Pin Type	Power Supply	Notes

the ground plane. Use ceramic chip capacitors with the highest possible self-resonant frequency. All traces must be kept short, wide and direct.

Note:

1. An 0805 sized capacitor is recommended for system initial bring-up.

Figure 60. SerDes PLL Power Supply Filter

Note the following:

- $AV_{DD-SRDS}$ must be a filtered version of SV_{DD} .
- Signals on the SerDes interface are fed from the XV_{DD} power plane.

22.3 Decoupling Recommendations

Due to large address and data buses, and high operating frequencies, the device can generate transient power surges and high frequency noise in its power supply, especially while driving large capacitive loads. This noise must be prevented from reaching other components in the device system, and the device itself requires a clean, tightly regulated source of power. Therefore, it is recommended that the system designer place at least one decoupling capacitor at each V_{DD} , TV_{DD} , BV_{DD} , OV_{DD} , GV_{DD} , and LV_{DD} pin of the device. These decoupling capacitors must receive their power from separate V_{DD} , TV_{DD} , BV_{DD} , OV_{DD} , GV_{DD} , LV_{DD} , and GND power planes in the PCB, utilizing short low impedance traces to minimize inductance. Capacitors must be placed directly under the device using a standard escape pattern as much as possible. If some caps are to be placed surrounding the part it must be routed with large trace to minimize the inductance.

These capacitors must have a value of 0.1 μF . Only ceramic SMT (surface mount technology) capacitors must be used to minimize lead inductance, preferably 0402 or 0603 sizes. Besides, it is recommended that there be several bulk storage capacitors distributed around the PCB, feeding the V_{DD} , TV_{DD} , BV_{DD} , OV_{DD} , GV_{DD} , and LV_{DD} , planes, to enable quick recharging of the smaller chip capacitors. These bulk capacitors must have a low ESR (equivalent series resistance) rating to ensure the quick response time necessary. They must also be connected to the power and ground planes through two vias to minimize inductance. Suggested bulk capacitors—100–330 μF (AVX TPS tantalum or Sanyo OSCON). However, customers must work directly with their power regulator vendor for best values, types and quantity of bulk capacitors.

22.4 SerDes Block Power Supply Decoupling Recommendations

The SerDes block requires a clean, tightly regulated source of power (SV_{DD} and XV_{DD}) to ensure low jitter on transmit and reliable recovery of data in the receiver. An appropriate decoupling scheme is outlined below.

Only surface mount technology (SMT) capacitors must be used to minimize inductance. Connections from all capacitors to power and ground must be done with multiple vias to further reduce inductance.

- $\overline{\text{SD_REF_CLK}}$

NOTE

It is recommended to power down the unused lane through SRDSCR1[0:7] register (offset = 0xE_0F08) (this prevents the oscillations and holds the receiver output in a fixed state) that maps to SERDES lane 0 to lane 7 accordingly.

Pins V28 and M26 must be tied to XV_{DD} . Pins V27 and M25 must be tied to GND through a 300- Ω resistor.

22.11 Guideline for PCI Interface Termination

PCI termination if PCI 1 or PCI 2 is not used at all.

Option 1

If PCI arbiter is enabled during POR:

- All AD pins are driven to the stable states after POR. Therefore, all ADs pins can be floating.
- All PCI control pins can be grouped together and tied to OV_{DD} through a single 10-k Ω resistor.
- It is optional to disable PCI block through DEVDISR register after POR reset.

Option 2

If PCI arbiter is disabled during POR:

- All AD pins are in the input state. Therefore, all ADs pins need to be grouped together and tied to OV_{DD} through a single (or multiple) 10-k Ω resistor(s).
- All PCI control pins can be grouped together and tied to OV_{DD} through a single 10-k Ω resistor.
- It is optional to disable PCI block through DEVDISR register after POR reset.

22.12 Guideline for LBIU Termination

If the LBIU parity pins are not used, the following is the termination recommendation:

- For LDP[0:3]—tie them to ground or the power supply rail via a 4.7-k Ω resistor.
- For LPBSE—tie it to the power supply rail via a 4.7-k Ω resistor (pull-up resistor).

Notes:

1. See [Section 19, "Package Description,"](#) for more information on available package types.
2. The HiCTE FC-CBGA package is available on only Version 2.0 of the device.
3. The FC-PBGA package is available on only Version 2.1.1, 2.1.2, and 2.1.3 of the device.
4. Processor core frequencies supported by parts addressed by this specification only. Not all parts described in this specification support all core frequencies. Additionally, parts addressed by part number specifications may support other maximum core frequencies.
5. This speed available only for silicon Version 2.1.1, 2.1.2, and 2.1.3.
