
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e500
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	800MHz
Co-Processors/DSP	Signal Processing; SPE
RAM Controllers	DDR, DDR2, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (4)
SATA	-
USB	-
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	-
Package / Case	783-BBGA, FCBGA
Supplier Device Package	783-FCBGA (29x29)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=mpc8543pxangb

- Memory prefetching of PCI read accesses
- Supports posting of processor-to-PCI and PCI-to-memory writes
- PCI 3.3-V compatible
- Selectable hardware-enforced coherency

• Serial RapidIO™ interface unit
  - Supports *RapidIO™ Interconnect Specification, Revision 1.2*
  - Both 1× and 4× LP-serial link interfaces
  - Long- and short-haul electricals with selectable pre-compensation
  - Transmission rates of 1.25, 2.5, and 3.125 Gbaud (data rates of 1.0, 2.0, and 2.5 Gbps) per lane
  - Auto detection of 1- and 4-mode operation during port initialization
  - Link initialization and synchronization
  - Large and small size transport information field support selectable at initialization time
  - 34-bit addressing
  - Up to 256 bytes data payload
  - All transaction flows and priorities
  - Atomic set/clr/inc/dec for read-modify-write operations
  - Generation of IO_READ_HOME and FLUSH with data for accessing cache-coherent data at a remote memory system
  - Receiver-controlled flow control
  - Error detection, recovery, and time-out for packets and control symbols as required by the RapidIO specification
  - Register and register bit extensions as described in part VIII (Error Management) of the RapidIO specification
  - Hardware recovery only
  - Register support is not required for software-mediated error recovery.
  - Accept-all mode of operation for fail-over support
  - Support for RapidIO error injection
  - Internal LP-serial and application interface-level loopback modes
  - Memory and PHY BIST for at-speed production test

• RapidIO-compatible message unit
  - 4 Kbytes of payload per message
  - Up to sixteen 256-byte segments per message
  - Two inbound data message structures within the inbox
  - Capable of receiving three letters at any mailbox
  - Two outbound data message structures within the outbox
  - Capable of sending three letters simultaneously
  - Single segment multicast to up to 32 devIDs
  - Chaining and direct modes in the outbox

3 Power Characteristics

The estimated typical power dissipation for the core complex bus (CCB) versus the core frequency for this family of PowerQUICC III devices is shown in the following table.

Table 4. Device Power Dissipation

CCB Frequency[1]	Core Frequency	SLEEP[2]	Typical-65[3]	Typical-105[4]	Maximum[5]	Unit
400	800	2.7	4.6	7.5	8.1	W
	1000	2.7	5.0	7.9	8.5	W
	1200	2.7	5.4	8.3	8.9	
500	1500	11.5	13.6	16.5	18.6	W
533	1333	6.2	7.9	10.8	12.8	W

Notes:

1. CCB frequency is the SoC platform frequency, which corresponds to the DDR data rate.
2. SLEEP is based on V_{DD} = 1.1 V, T_j = 65°C.
3. Typical-65 is based on V_{DD} = 1.1 V, T_j = 65°C, running Dhrystone.
4. Typical-105 is based on V_{DD} = 1.1 V, T_j = 105°C, running Dhrystone.
5. Maximum is based on V_{DD} = 1.1 V, T_j = 105°C, running a smoke test.

8 Enhanced Three-Speed Ethernet (eTSEC)

This section provides the AC and DC electrical characteristics for the enhanced three-speed Ethernet controller. The electrical characteristics for MDIO and MDC are specified in Section 9, "Ethernet Management Interface Electrical Characteristics."

8.1 Enhanced Three-Speed Ethernet Controller (eTSEC) (10/100/1Gb Mbps)—GMII/MII/TBI/RGMII/RTBI/RMII Electrical Characteristics

The electrical characteristics specified here apply to all gigabit media independent interface (GMII), media independent interface (MII), ten-bit interface (TBI), reduced gigabit media independent interface (RGMII), reduced ten-bit interface (RTBI), and reduced media independent interface (RMII) signals except management data input/output (MDIO) and management data clock (MDC). The RGMII and RTBI interfaces are defined for 2.5 V, while the GMII, MII, and TBI interfaces can be operated at 3.3 or 2.5 V. The GMII, MII, or TBI interface timing is compliant with the IEEE 802.3. The RGMII and RTBI interfaces follow the *Reduced Gigabit Media-Independent Interface (RGMII) Specification Version 1.3* (12/10/2000). The RMII interface follows the *RMII Consortium RMII Specification Version 1.2* (3/20/1998). The electrical characteristics for MDIO and MDC are specified in Section 9, "Ethernet Management Interface Electrical Characteristics."

8.1.1 eTSEC DC Electrical Characteristics

All GMII, MII, TBI, RGMII, RMII, and RTBI drivers and receivers comply with the DC parametric attributes specified in Table 22 and Table 23. The RGMII and RTBI signals are based on a 2.5-V CMOS interface voltage as defined by JEDEC EIA/JESD8-5.

Table 22. GMII, MII, RMII, and TBI DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit	Notes
Supply voltage 3.3 V	LV_{DD} TV_{DD}	3.13	3.47	V	1, 2
Output high voltage (LV_{DD}/TV_{DD} = min, I_{OH} = –4.0 mA)	V_{OH}	2.40	LV_{DD}/TV_{DD} + 0.3	V	—
Output low voltage (LV_{DD}/TV_{DD} = min, I_{OL} = 4.0 mA)	V_{OL}	GND	0.50	V	—
Input high voltage	V_{IH}	2.0	LV_{DD}/TV_{DD} + 0.3	V	—
Input low voltage	V_{IL}	–0.3	0.90	V	—
Input high current (V_{IN} = LV_{DD}, V_{IN} = TV_{DD})	I_{IH}	—	40	μA	1, 2, 3
Input low current (V_{IN} = GND)	I_{IL}	–600	—	μA	—

Notes:
1. LV_{DD} supports eTSECs 1 and 2.
2. TV_{DD} supports eTSECs 3 and 4.
3. The symbol V_{IN}, in this case, represents the LV_{IN} and TV_{IN} symbols referenced in Table 1 and Table 2.

Figure 8 shows the GMII transmit AC timing diagram.

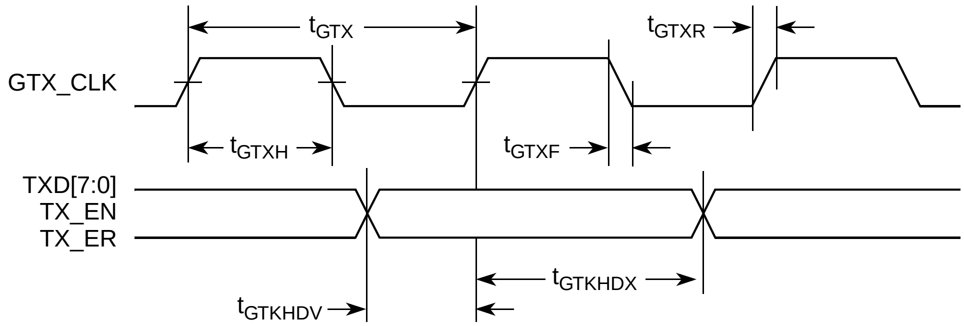

Figure 8. GMII Transmit AC Timing Diagram

8.2.2.2 GMII Receive AC Timing Specifications

This table provides the GMII receive AC timing specifications.

Table 27. GMII Receive AC Timing Specifications

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
RX_CLK clock period	t_{GRX}	—	8.0	—	ns
RX_CLK duty cycle	t_{GRXH}/t_{GRX}	35	—	75	ns
RXD[7:0], RX_DV, RX_ER setup time to RX_CLK	t_{GRDVKH}	2.0	—	—	ns
RXD[7:0], RX_DV, RX_ER hold time to RX_CLK	t_{GRDXKH}	0	—	—	ns
RX_CLK clock rise (20%-80%)	t_{GRXR}[2]	—	—	1.0	ns
RX_CLK clock fall time (80%-20%)	t_{GRXF}[2]	—	—	1.0	ns

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{GRDVKH} symbolizes GMII receive timing (GR) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{RX} clock reference (K) going to the high state (H) or setup time. Also, t_{GRDXKL} symbolizes GMII receive timing (GR) with respect to the time data input signals (D) went invalid (X) relative to the t_{GRX} clock reference (K) going to the low (L) state or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{GRX} represents the GMII (G) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Guaranteed by design.

Figure 9 provides the AC test load for eTSEC.

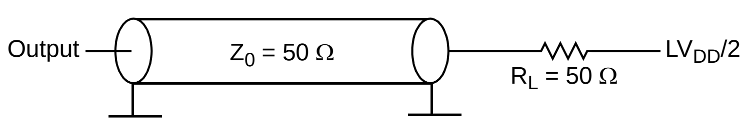

Figure 9. eTSEC AC Test Load

Figure 13 shows the MII receive AC timing diagram.

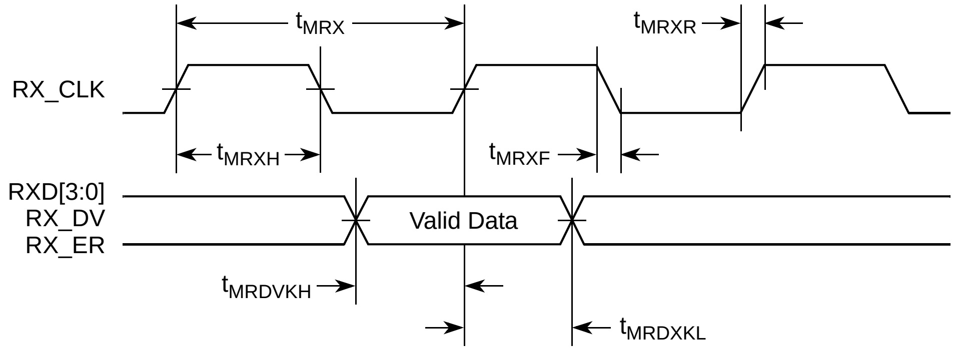

Figure 13. MII Receive AC Timing Diagram

8.2.4 TBI AC Timing Specifications

This section describes the TBI transmit and receive AC timing specifications.

8.2.4.1 TBI Transmit AC Timing Specifications

This table provides the TBI transmit AC timing specifications.

Table 30. TBI Transmit AC Timing Specifications

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
TCG[9:0] setup time GTX_CLK going high	t_{TTKHDV}	2.0	—	—	ns
TCG[9:0] hold time from GTX_CLK going high	t_{TTKHDX}	1.0	—	—	ns
GTX_CLK rise (20%–80%)	t_{TTXR}[2]	—	—	1.0	ns
GTX_CLK fall time (80%–20%)	t_{TTXF}[2]	—	—	1.0	ns

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{(first\ two\ letters\ of\ functional\ block)(signal)(state\ )(reference)(state)}$ for inputs and $t_{(first\ two\ letters\ of\ functional\ block)(reference)(state)(signal)(state)}$ for outputs. For example, t_{TTKHDV} symbolizes the TBI transmit timing (TT) with respect to the time from t_{TTX} (K) going high (H) until the referenced data signals (D) reach the valid state (V) or setup time. Also, t_{TTKHDX} symbolizes the TBI transmit timing (TT) with respect to the time from t_{TTX} (K) going high (H) until the referenced data signals (D) reach the invalid state (X) or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{TTX} represents the TBI (T) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Guaranteed by design.

Table 42. Local Bus Timing Parameters—PLL Bypassed (continued)

Parameter	Symbol[1]	Min	Max	Unit	Notes
$\overline{LGTA}$/LUPWAIT input hold from local bus clock	$t_{LBIXKL2}$	–1.3	—	ns	4, 5
LALE output transition to LAD/LDP output transition (LATCH hold time)	t_{LBOTOT}	1.5	—	ns	6
Local bus clock to output valid (except LAD/LDP and LALE)	$t_{LBKLOV1}$	—	–0.3	ns	—
Local bus clock to data valid for LAD/LDP	$t_{LBKLOV2}$	—	–0.1	ns	4
Local bus clock to address valid for LAD	$t_{LBKLOV3}$	—	0	ns	4
Local bus clock to LALE assertion	$t_{LBKLOV4}$	—	0	ns	4
Output hold from local bus clock (except LAD/LDP and LALE)	$t_{LBKLOX1}$	–3.7	—	ns	4
Output hold from local bus clock for LAD/LDP	$t_{LBKLOX2}$	–3.7	—	ns	4
Local bus clock to output high Impedance (except LAD/LDP and LALE)	$t_{LBKLOZ1}$	—	0.2	ns	7
Local bus clock to output high impedance for LAD/LDP	$t_{LBKLOZ2}$	—	0.2	ns	7

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{(first\ two\ letters\ of\ functional\ block)(signal)(state)(reference)(state)}$ for inputs and $t_{(first\ two\ letters\ of\ functional\ block)(reference)(state)(signal)(state)}$ for outputs. For example, $t_{LBIXKH1}$ symbolizes local bus timing (LB) for the input (I) to go invalid (X) with respect to the time the t_{LBK} clock reference (K) goes high (H), in this case for clock one (1). Also, t_{LBKHOX} symbolizes local bus timing (LB) for the t_{LBK} clock reference (K) to go high (H), with respect to the output (O) going invalid (X) or output hold time.
2. All timings are in reference to local bus clock for PLL bypass mode. Timings may be negative with respect to the local bus clock because the actual launch and capture of signals is done with the internal launch/capture clock, which precedes LCLK by t_{LBKHKT}.
3. Maximum possible clock skew between a clock LCLK[m] and a relative clock LCLK[*n*]. Skew measured between complementary signals at $BV_{DD}/2$.
4. All signals are measured from $BV_{DD}/2$ of the rising edge of local bus clock for PLL bypass mode to $0.4 \times BV_{DD}$ of the signal in question for 3.3-V signaling levels.
5. Input timings are measured at the pin.
6. The value of t_{LBOTOT} is the measurement of the minimum time between the negation of LALE and any change in LAD.
7. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
8. Guaranteed by characterization.
9. Guaranteed by design.

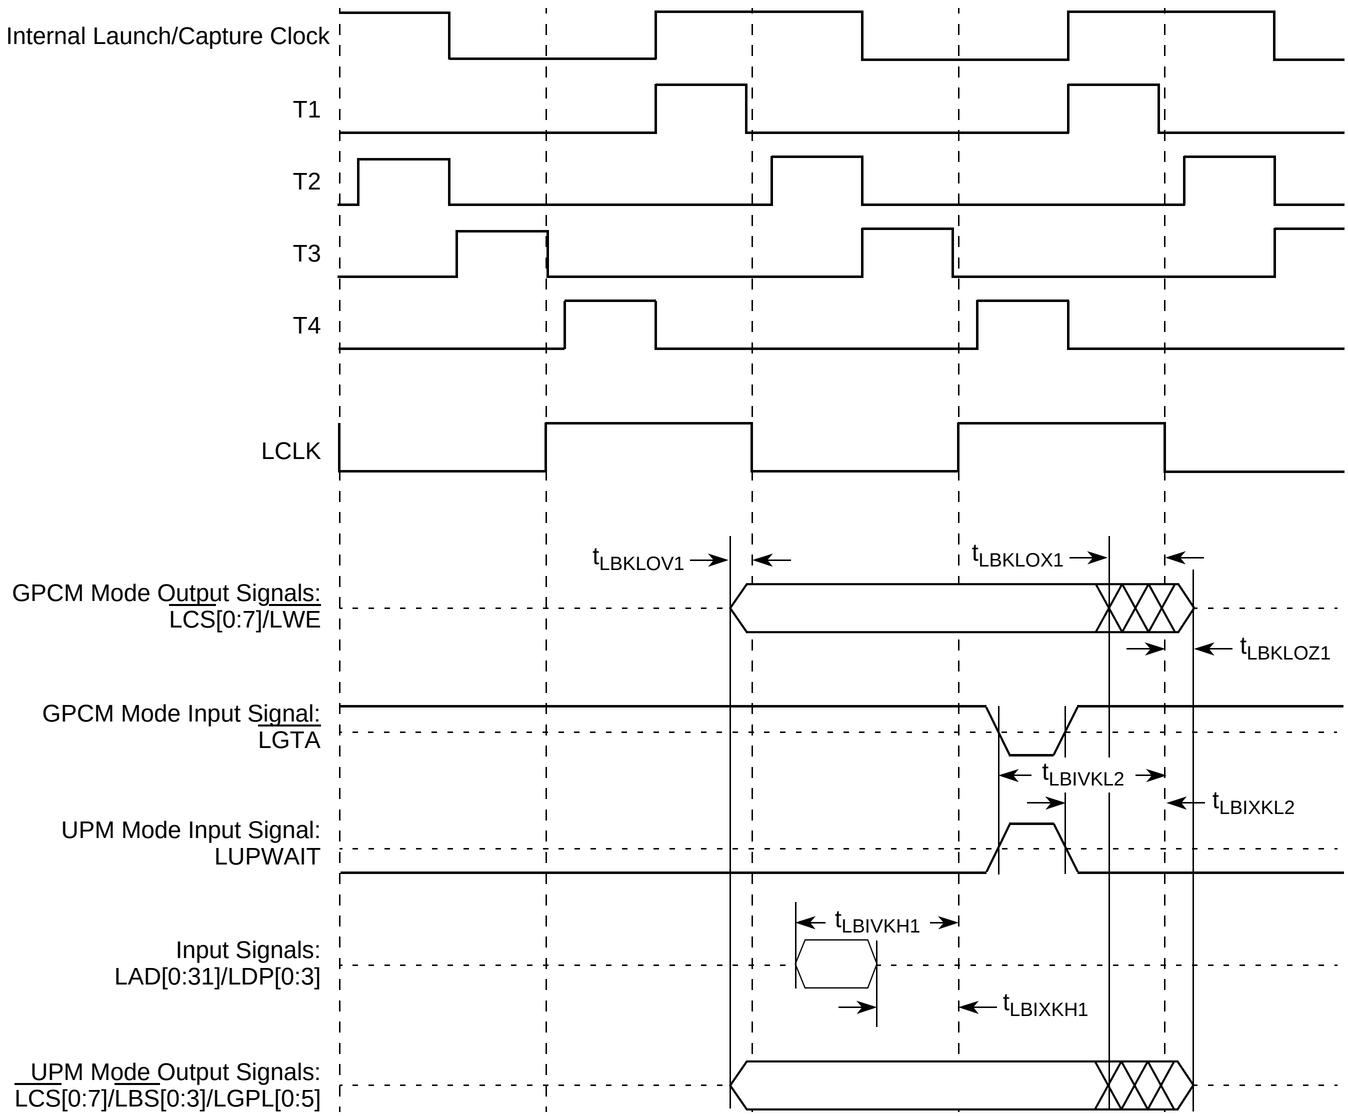

Figure 28. Local Bus Signals, GPCM/UPM Signals for LCCR[CLKDIV] = 8 or 16 (PLL Bypass Mode)

Figure 34 shows the AC timing diagram for the I^{2}C bus.

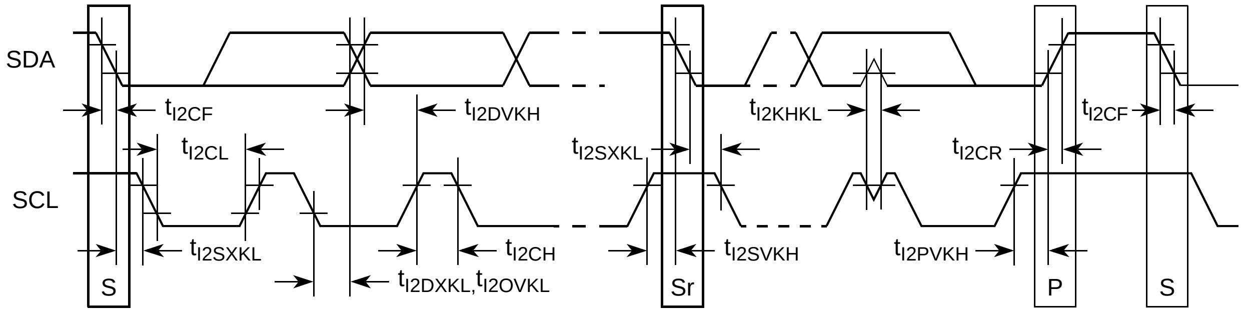

Figure 34. I^{2}C Bus AC Timing Diagram

Figure 36 shows the PCI/PCI-X input AC timing conditions.

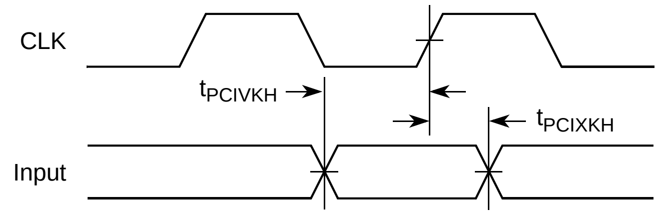

Figure 36. PCI/PCI-X Input AC Timing Measurement Conditions

Figure 37 shows the PCI/PCI-X output AC timing conditions.

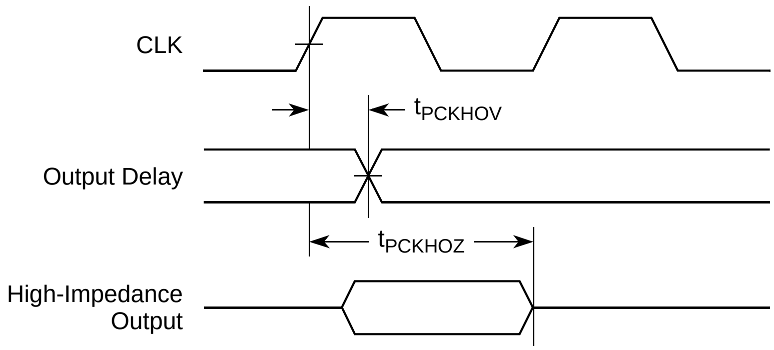

Figure 37. PCI/PCI-X Output AC Timing Measurement Condition

Table 53 provides the PCI-X AC timing specifications at 66 MHz.

Table 53. PCI-X AC Timing Specifications at 66 MHz

Parameter	Symbol	Min	Max	Unit	Notes
SYSCLK to signal valid delay	t_{PCKHOV}	—	3.8	ns	1, 2, 3, 7, 8
Output hold from SYSCLK	t_{PCKHOX}	0.7	—	ns	1, 10
SYSCLK to output high impedance	t_{PCKHOZ}	—	7	ns	1, 4, 8, 11
Input setup time to SYSCLK	t_{PCIVKH}	1.7	—	ns	3, 5
Input hold time from SYSCLK	t_{PCIXKH}	0.5	—	ns	10
$\overline{\text{REQ64}}$ to $\overline{\text{HRESET}}$ setup time	t_{PCRVRH}	10	—	clocks	11
$\overline{\text{HRESET}}$ to $\overline{\text{REQ64}}$ hold time	t_{PCRHRX}	0	50	ns	11
$\overline{\text{HRESET}}$ high to first $\overline{\text{FRAME}}$ assertion	t_{PCRHFV}	10	—	clocks	9, 11
PCI-X initialization pattern to $\overline{\text{HRESET}}$ setup time	t_{PCIVRH}	10	—	clocks	11

Table 53. PCI-X AC Timing Specifications at 66 MHz (continued)

Parameter	Symbol	Min	Max	Unit	Notes
HRESET to PCI-X initialization pattern hold time	t_{PCRHIX}	0	50	ns	6, 11

Notes:

1. See the timing measurement conditions in the *PCI-X 1.0a Specification*.
2. Minimum times are measured at the package pin (not the test point). Maximum times are measured with the test point and load circuit.
3. Setup time for point-to-point signals applies to REQ and GNT only. All other signals are bused.
4. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
5. Setup time applies only when the device is not driving the pin. Devices cannot drive and receive signals at the same time.
6. Maximum value is also limited by delay to the first transaction (time for HRESET high to first configuration access, t_{PCRHFV}). The PCI-X initialization pattern control signals after the rising edge of HRESET must be negated no later than two clocks before the first FRAME and must be floated no later than one clock before FRAME is asserted.
7. A PCI-X device is permitted to have the minimum values shown for t_{PCKHOV} and t_{CYC} only in PCI-X mode. In conventional mode, the device must meet the requirements specified in PCI 2.2 for the appropriate clock frequency.
8. Device must meet this specification independent of how many outputs switch simultaneously.
9. The timing parameter t_{PCRHFV} is a minimum of 10 clocks rather than the minimum of 5 clocks in the *PCI-X 1.0a Specification.*
10. Guaranteed by characterization.
11. Guaranteed by design.

This table provides the PCI-X AC timing specifications at 133 MHz. Note that the maximum PCI-X frequency in synchronous mode is 110 MHz.

Table 54. PCI-X AC Timing Specifications at 133 MHz

Parameter	Symbol	Min	Max	Unit	Notes
SYSCLK to signal valid delay	t_{PCKHOV}	—	3.8	ns	1, 2, 3, 7, 8
Output hold from SYSCLK	t_{PCKHOX}	0.7	—	ns	1, 11
SYSCLK to output high impedance	t_{PCKHOZ}	—	7	ns	1, 4, 8, 12
Input setup time to SYSCLK	t_{PCIVKH}	1.2	—	ns	3, 5, 9, 11
Input hold time from SYSCLK	t_{PCIXKH}	0.5	—	ns	11
REQ64 to HRESET setup time	t_{PCRVRH}	10	—	clocks	12
HRESET to REQ64 hold time	t_{PCRHRX}	0	50	ns	12
HRESET high to first FRAME assertion	t_{PCRHFV}	10	—	clocks	10, 12
PCI-X initialization pattern to HRESET setup time	t_{PCIVRH}	10	—	clocks	12

— The input amplitude of the differential clock must be between 400 and 1600 mV differential peak-peak (or between 200 and 800 mV differential peak). In other words, each signal wire of the differential pair must have a single-ended swing less than 800 mV and greater than 200 mV. This requirement is the same for both external DC- or AC-coupled connection.

— For external DC-coupled connection, as described in Section 16.2.1, “SerDes Reference Clock Receiver Characteristics,” the maximum average current requirements sets the requirement for average voltage (common mode voltage) to be between 100 and 400 mV. Figure 40 shows the SerDes reference clock input requirement for DC-coupled connection scheme.

— For external AC-coupled connection, there is no common mode voltage requirement for the clock driver. Since the external AC-coupling capacitor blocks the DC level, the clock driver and the SerDes reference clock receiver operate in different command mode voltages. The SerDes reference clock receiver in this connection scheme has its common mode voltage set to SGND_SRDS*n*. Each signal wire of the differential inputs is allowed to swing below and above the command mode voltage (SGND_SRDS*n*). Figure 41 shows the SerDes reference clock input requirement for AC-coupled connection scheme.

- Single-ended mode

— The reference clock can also be single-ended. The SD_REF_CLK input amplitude (single-ended swing) must be between 400 and 800 mV peak-to-peak (from V_{min} to V_{max}) with $\overline{\text{SD\_REF\_CLK}}$ either left unconnected or tied to ground.

— The SD_REF_CLK input average voltage must be between 200 and 400 mV. Figure 42 shows the SerDes reference clock input requirement for single-ended signaling mode.

— To meet the input amplitude requirement, the reference clock inputs might need to be DC- or AC-coupled externally. For the best noise performance, the reference of the clock could be DC- or AC-coupled into the unused phase ($\overline{\text{SD\_REF\_CLK}}$) through the same source impedance as the clock input (SD_REF_CLK) in use.

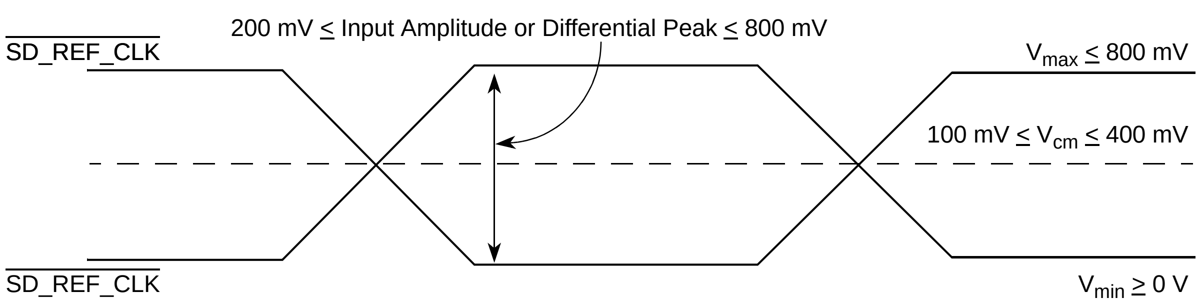

Figure 40. Differential Reference Clock Input DC Requirements (External DC-Coupled)

16.2.4 AC Requirements for SerDes Reference Clocks

The clock driver selected must provide a high quality reference clock with low phase noise and cycle-to-cycle jitter. Phase noise less than 100 kHz can be tracked by the PLL and data recovery loops and is less of a problem. Phase noise above 15 MHz is filtered by the PLL. The most problematic phase noise occurs in the 1–15 MHz range. The source impedance of the clock driver must be 50 Ω to match the transmission line and reduce reflections which are a source of noise to the system.

The detailed AC requirements of the SerDes reference clocks are defined by each interface protocol based on application usage. See the following sections for detailed information:

- Section 17.2, “AC Requirements for PCI Express SerDes Clocks”
- Section 18.2, “AC Requirements for Serial RapidIO SD_REF_CLK and SD_REF_CLK”

16.2.4.1 Spread Spectrum Clock

SD_REF_CLK/$\overline{\text{SD\_REF\_CLK}}$ are designed to work with a spread spectrum clock (+0% to –0.5% spreading at 30–33 kHz rate is allowed), assuming both ends have same reference clock. For better results, a source without significant unintended modulation must be used.

16.3 SerDes Transmitter and Receiver Reference Circuits

Figure 47 shows the reference circuits for SerDes data lane’s transmitter and receiver.

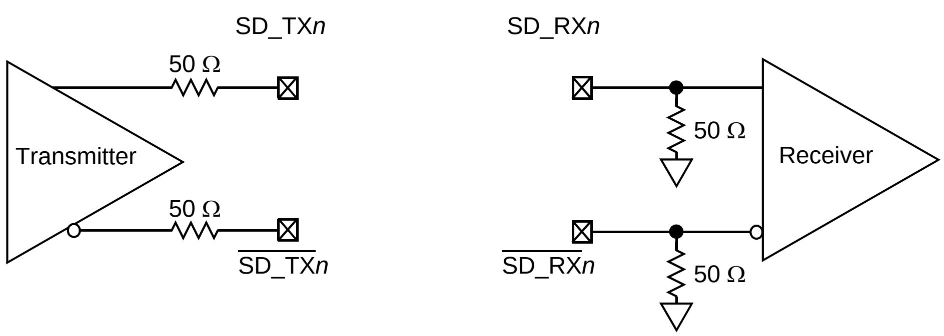

Figure 47. SerDes Transmitter and Receiver Reference Circuits

The DC and AC specification of SerDes data lanes are defined in each interface protocol section below (PCI Express, Serial Rapid IO, or SGMII) in this document based on the application usage:

- Section 17, “PCI Express”
- Section 18, “Serial RapidIO”

Note that external an AC coupling capacitor is required for the above three serial transmission protocols with the capacitor value defined in the specification of each protocol section.

Table 63. Long Run Transmitter AC Timing Specifications—2.5 GBaud

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Output voltage	V_O	–0.40	2.30	V	Voltage relative to COMMON of either signal comprising a differential pair
Differential output voltage	V_{DIFFPP}	800	1600	mVp-p	—
Deterministic jitter	J_D	—	0.17	UI p-p	—
Total jitter	J_T	—	0.35	UI p-p	—
Multiple output skew	S_{MO}	—	1000	ps	Skew at the transmitter output between lanes of a multilane link
Unit interval	UI	400	400	ps	±100 ppm

Table 64. Long Run Transmitter AC Timing Specifications—3.125 GBaud

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Output voltage	V_O	–0.40	2.30	V	Voltage relative to COMMON of either signal comprising a differential pair
Differential output voltage	V_{DIFFPP}	800	1600	mVp-p	—
Deterministic jitter	J_D	—	0.17	UI p-p	—
Total jitter	J_T	—	0.35	UI p-p	—
Multiple output skew	S_{MO}	—	1000	ps	Skew at the transmitter output between lanes of a multilane link
Unit interval	UI	320	320	ps	±100 ppm

For each baud rate at which an LP-serial transmitter is specified to operate, the output eye pattern of the transmitter shall fall entirely within the unshaded portion of the transmitter output compliance mask shown in Figure 52 with the parameters specified in Table 65 when measured at the output pins of the device and the device is driving a 100-Ω ± 5% differential resistive load. The output eye pattern of an LP-serial transmitter that implements pre-emphasis (to equalize the link and reduce inter-symbol interference) need only comply with the transmitter output compliance mask when pre-emphasis is disabled or minimized.

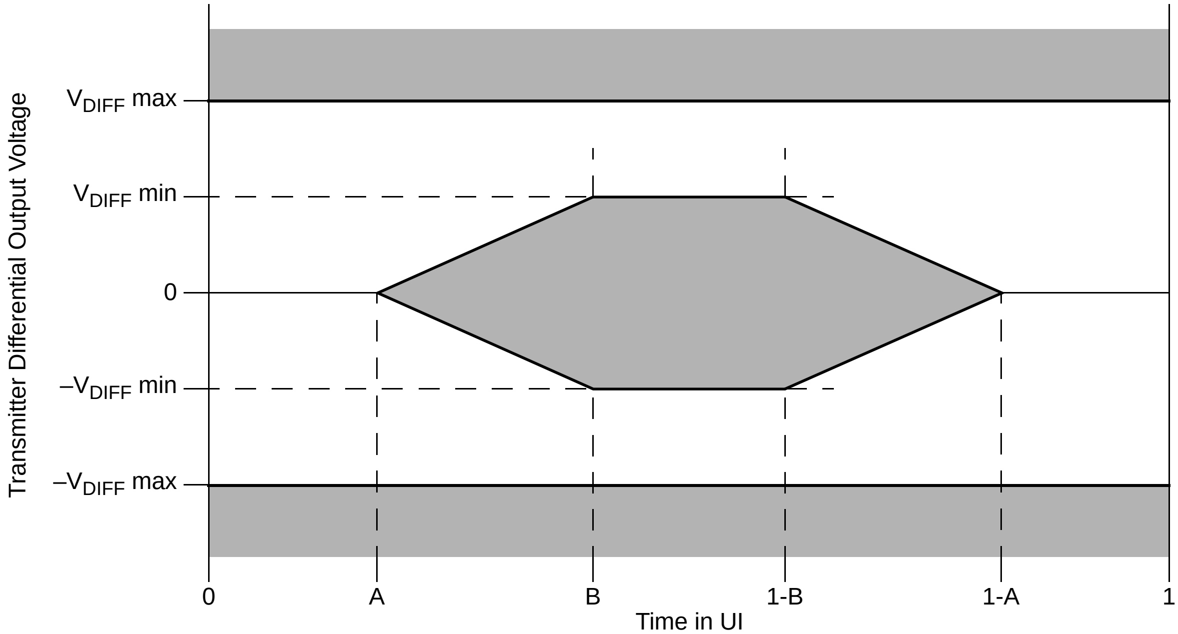

Figure 52. Transmitter Output Compliance Mask

Table 65. Transmitter Differential Output Eye Diagram Parameters

Transmitter Type	V_{DIFF}min (mV)	V_{DIFF}max (mV)	A (UI)	B (UI)
1.25 GBaud short range	250	500	0.175	0.39
1.25 GBaud long range	400	800	0.175	0.39
2.5 GBaud short range	250	500	0.175	0.39
2.5 GBaud long range	400	800	0.175	0.39
3.125 GBaud short range	250	500	0.175	0.39
3.125 GBaud long range	400	800	0.175	0.39

18.7 Receiver Specifications

LP-serial receiver electrical and timing specifications are stated in the text and tables of this section.

Receiver input impedance shall result in a differential return loss better that 10 dB and a common mode return loss better than 6 dB from 100 MHz to (0.8) × (baud frequency). This includes contributions from on-chip circuitry, the chip package, and any off-chip components related to the receiver. AC coupling

22.10 Guidelines for High-Speed Interface Termination

This section provides the guidelines for high-speed interface termination when the SerDes interface is entirely unused and when it is partly unused.

22.10.1 SerDes Interface Entirely Unused

If the high-speed SerDes interface is not used at all, the unused pin must be terminated as described in this section.

The following pins must be left unconnected (float):

- SD_TX[7:0]
- $\overline{\text{SD\_TX}}$[7:0]
- Reserved pins T22, T23, M20, M21

The following pins must be connected to GND:

- SD_RX[7:0]
- $\overline{\text{SD\_RX}}$[7:0]
- SD_REF_CLK
- $\overline{\text{SD\_REF\_CLK}}$

NOTE

It is recommended to power down the unused lane through SRDSCR1[0:7] register (offset = 0xE_0F08) (This prevents the oscillations and holds the receiver output in a fixed state.) that maps to SERDES lane 0 to lane 7 accordingly.

Pins V28 and M26 must be tied to XV_{DD}. Pins V27 and M25 must be tied to GND through a 300-Ω resistor.

In Rev 2.0 silicon, POR configuration pin cfg_srds_en on TSEC4_TXD[2]/TSEC3_TXD[6] can be used to power down SerDes block.

22.10.2 SerDes Interface Partly Unused

If only part of the high-speed SerDes interface pins are used, the remaining high-speed serial I/O pins must be terminated as described in this section.

The following pins must be left unconnected (float) if not used:

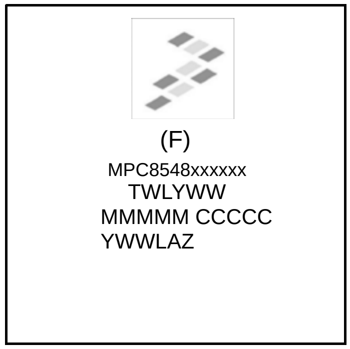
- SD_TX[7:0]
- $\overline{\text{SD\_TX}}$[7:0]
- Reserved pins: T22, T23, M20, M21

The following pins must be connected to GND if not used:

- SD_RX[7:0]
- $\overline{\text{SD\_RX}}$[7:0]
- SD_REF_CLK

23.2 Part Marking

Parts are marked as the example shown in Figure 64.



Notes:

TWLYYWW is final test traceability code.
MMMMM is 5 digit mask number.
CCCCC is the country of assembly. This space is left blank if parts are assembled in the United States.
YWWLAZ is assembly traceability code.

Figure 64. Part Marking for CBGA and PBGA Device
