
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e500
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	1.2GHz
Co-Processors/DSP	Signal Processing; SPE, Security; SEC
RAM Controllers	DDR, DDR2, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (4)
SATA	-
USB	-
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	Cryptography, Random Number Generator
Package / Case	783-BBGA, FCBGA
Supplier Device Package	783-FCPBGA (29x29)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=mpc8545evtatgc

- AESU—Advanced Encryption Standard unit
  - Implements the Rijndael symmetric key cipher
  - ECB, CBC, CTR, and CCM modes
  - 128-, 192-, and 256-bit key lengths
- AFEU—ARC four execution unit
  - Implements a stream cipher compatible with the RC4 algorithm
  - 40- to 128-bit programmable key
- MDEU—message digest execution unit
  - SHA with 160- or 256-bit message digest
  - MD5 with 128-bit message digest
  - HMAC with either algorithm
- KEU—Kasumi execution unit
  - Implements F8 algorithm for encryption and F9 algorithm for integrity checking
  - Also supports A5/3 and GEA-3 algorithms
- RNG—random number generator
- XOR engine for parity checking in RAID storage applications

• Dual I^2C controllers
- Two-wire interface
- Multiple master support
- Master or slave I^2C mode support
- On-chip digital filtering rejects spikes on the bus

• Boot sequencer
- Optionally loads configuration data from serial ROM at reset via the I^2C interface
- Can be used to initialize configuration registers and/or memory
- Supports extended I^2C addressing mode
- Data integrity checked with preamble signature and CRC

• DUART
- Two 4-wire interfaces (SIN, SOUT, $\overline{\text{RTS}}$, $\overline{\text{CTS}}$)
- Programming model compatible with the original 16450 UART and the PC16550D

• Local bus controller (LBC)
- Multiplexed 32-bit address and data bus operating at up to 133 MHz
- Eight chip selects support eight external slaves
- Up to eight-beat burst transfers
- The 32-, 16-, and 8-bit port sizes are controlled by an on-chip memory controller.
- Three protocol engines available on a per chip select basis:
  - General-purpose chip select machine (GPCM)
  - Three user programmable machines (UPMs)

4.3 eTSEC Gigabit Reference Clock Timing

The following table provides the eTSEC gigabit reference clocks (EC_GTX_CLK125) AC timing specifications for the device.

Table 6. EC_GTX_CLK125 AC Timing Specifications

Parameter/Condition	Symbol	Min	Typ	Max	Unit	Notes
EC_GTX_CLK125 frequency	f_{G125}	—	125	—	MHz	—
EC_GTX_CLK125 cycle time	t_{G125}	—	8	—	ns	
EC_GTX_CLK125 rise and fall time L/TVDD = 2.5 V L/TVDD = 3.3 V	t_{G125R}, t_{G125F}	—	—	 0.75 1.0	ns	1
EC_GTX_CLK125 duty cycle GMII, TBI 1000Base-T for RGMII, RTBI	t_{G125H}/t_{G125}	 45 47	—	 55 53	%	2, 3

Notes:

1. Rise and fall times for EC_GTX_CLK125 are measured from 0.5 and 2.0 V for L/TV_{DD} = 2.5 V, and from 0.6 and 2.7 V for L/TV_{DD} = 3.3 V.
2. Timing is guaranteed by design and characterization.
3. EC_GTX_CLK125 is used to generate the GTX clock TSEC*n*_GTX_CLK for the eTSEC transmitter with 2% degradation. EC_GTX_CLK125 duty cycle can be loosened from 47/53% as long as the PHY device can tolerate the duty cycle generated by the TSEC*n*_ GTX_CLK. See Section 8.2.6, "RGMII and RTBI AC Timing Specifications," for duty cycle for 10Base-T and 100Base-T reference clock.

4.4 PCI/PCI-X Reference Clock Timing

When the PCI/PCI-X controller is configured for asynchronous operation, the reference clock for the PCI/PCI-x controller is not the SYSCLK input, but instead the PCI*n*_CLK. The following table provides the PCI/PCI-X reference clock AC timing specifications for the device.

Table 7. PCI*n*_CLK AC Timing Specifications

At recommended operating conditions (see Table 2) with OV_{DD} = 3.3 V ± 165 mV.

Parameter/Condition	Symbol	Min	Typ	Max	Unit	Notes
PCI*n*_CLK frequency	f_{PCICLK}	16	—	133	MHz	—
PCI*n*_CLK cycle time	t_{PCICLK}	7.5	—	60	ns	—
PCI*n*_CLK rise and fall time	t_{PCIKH}, t_{PCIKL}	0.6	1.0	2.1	ns	1, 2
PCI*n*_CLK duty cycle	$t_{PCIKHKL}/t_{PCICLK}$	40	—	60	%	2

Notes:

1. Rise and fall times for SYSCLK are measured at 0.6 and 2.7 V.
2. Timing is guaranteed by design and characterization.

5 RESET Initialization

This section describes the AC electrical specifications for the RESET initialization timing requirements of the device. The following table provides the RESET initialization AC timing specifications for the DDR SDRAM component(s).

Table 8. RESET Initialization Timing Specifications

Parameter/Condition	Min	Max	Unit	Notes
Required assertion time of $\overline{\text{HRESET}}$	100	—	µs	—
Minimum assertion time for $\overline{\text{SRESET}}$	3	—	SYSCLKs	1
PLL input setup time with stable SYSCLK before $\overline{\text{HRESET}}$ negation	100	—	µs	—
Input setup time for POR configs (other than PLL config) with respect to negation of $\overline{\text{HRESET}}$	4	—	SYSCLKs	1
Input hold time for all POR configs (including PLL config) with respect to negation of $\overline{\text{HRESET}}$	2	—	SYSCLKs	1
Maximum valid-to-high impedance time for actively driven POR configs with respect to negation of $\overline{\text{HRESET}}$	—	5	SYSCLKs	1

Note:
1. SYSCLK is the primary clock input for the device.

The following table provides the PLL lock times.

Table 9. PLL Lock Times

Parameter/Condition	Min	Max	Unit
Core and platform PLL lock times	—	100	µs
Local bus PLL lock time	—	50	µs
PCI/PCI-X bus PLL lock time	—	50	µs

5.1 Power-On Ramp Rate

This section describes the AC electrical specifications for the power-on ramp rate requirements. Controlling the maximum power-on ramp rate is required to avoid falsely triggering the ESD circuitry. The following table provides the power supply ramp rate specifications.

Table 10. Power Supply Ramp Rate

Parameter	Min	Max	Unit	Notes
Required ramp rate for MVREF	—	3500	V/s	1
Required ramp rate for VDD	—	4000	V/s	1, 2

Note:
1. Maximum ramp rate from 200 to 500 mV is most critical as this range may falsely trigger the ESD circuitry.
2. VDD itself is not vulnerable to false ESD triggering; however, as per Section 22.2, "PLL Power Supply Filtering," the recommended AVDD_CORE, AVDD_PLAT, AVDD_LBIU, AVDD_PCI1 and AVDD_PCI2 filters are all connected to VDD. Their ramp rates must be equal to or less than the VDD ramp rate.

6.2.2 DDR SDRAM Output AC Timing Specifications

Table 19. DDR SDRAM Output AC Timing Specifications

At recommended operating conditions.

Parameter	Symbol[1]	Min	Max	Unit	Notes
MCK[n] cycle time, MCK[*n*]/$\overline{\text{MCK}}$[*n*] crossing	t_{MCK}	3.75	6	ns	2
ADDR/CMD output setup with respect to MCK 533 MHz 400 MHz 333 MHz	t_{DDKHAS}	 1.48 1.95 2.40	 — — —	ns	3
ADDR/CMD output hold with respect to MCK 533 MHz 400 MHz 333 MHz	t_{DDKHAX}	 1.48 1.95 2.40	 — — —	ns	3
$\overline{\text{MCS}}$[*n*] output setup with respect to MCK 533 MHz 400 MHz 333 MHz	t_{DDKHCS}	 1.48 1.95 2.40	 — — —	ns	3
$\overline{\text{MCS}}$[*n*] output hold with respect to MCK 533 MHz 400 MHz 333 MHz	t_{DDKHCX}	 1.48 1.95 2.40	 — — —	ns	3
MCK to MDQS Skew	t_{DDKHMH}	–0.6	0.6	ns	4
MDQ/MECC/MDM output setup with respect to MDQS 533 MHz 400 MHz 333 MHz	t_{DDKHDS}, t_{DDKLDS}	 538 700 900	 — — —	ps	5
MDQ/MECC/MDM output hold with respect to MDQS 533 MHz 400 MHz 333 MHz	t_{DDKHDX}, t_{DDKLDX}	 538 700 900	 — — —	ps	5
MDQS preamble start	t_{DDKHMP}	$-0.5 \times t_{MCK} - 0.6$	$-0.5 \times t_{MCK} + 0.6$	ns	6

7 DUART

This section describes the DC and AC electrical specifications for the DUART interface of the device.

7.1 DUART DC Electrical Characteristics

This table provides the DC electrical characteristics for the DUART interface.

Table 20. DUART DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
High-level input voltage	V_{IH}	2	OV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	–0.3	0.8	V
Input current (V_{IN}[1] = 0 V or V_{IN} = V_{DD})	I_{IN}	—	±5	μA
High-level output voltage (OV_{DD} = min, I_{OH} = –2 mA)	V_{OH}	2.4	—	V
Low-level output voltage (OV_{DD} = min, I_{OL} = 2 mA)	V_{OL}	—	0.4	V

Note:
1. Note that the symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 1 and Table 2.

7.2 DUART AC Electrical Specifications

This table provides the AC timing parameters for the DUART interface.

Table 21. DUART AC Timing Specifications

Parameter	Value	Unit	Notes
Minimum baud rate	f_{CCB}/1,048,576	baud	1, 2
Maximum baud rate	f_{CCB}/16	baud	1, 2, 3
Oversample rate	16	—	1, 4

Notes:
1. Guaranteed by design.
2. f_{CCB} refers to the internal platform clock.
3. Actual attainable baud rate is limited by the latency of interrupt processing.
4. The middle of a start bit is detected as the 8^{th} sampled 0 after the 1-to-0 transition of the start bit. Subsequent bit values are sampled each 16^{th} sample.

Table 37. MII Management AC Timing Specifications (continued)

At recommended operating conditions with OV_{DD} is 3.3 V ± 5%.

Parameter	Symbol[1]	Min	Typ	Max	Unit	Notes
MDC fall time	t_{MDHF}	—		10	ns	4

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MDKHDX} symbolizes management data timing (MD) for the time t_{MDC} from clock reference (K) high (H) until data outputs (D) are invalid (X) or data hold time. Also, t_{MDDVKH} symbolizes management data timing (MD) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MDC} clock reference (K) going to the high (H) state or setup time. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. This parameter is dependent on the eTSEC system clock speed, which is half of the Platform Frequency (f_{CCB}). The actual ECn_MDC output clock frequency for a specific eTSEC port can be programmed by configuring the MgmtClk bit field of device's MIIMCFG register, based on the platform (CCB) clock running for the device. The formula is: Platform Frequency (CCB) ÷ (2 × Frequency Divider determined by MIICFG[MgmtClk] encoding selection). For example, if MIICFG[MgmtClk] = 000 and the platform (CCB) is currently running at 533 MHz, f_{MDC} = 533) ÷ (2 × 4 × 8) = 533) ÷ 64 = 8.3 MHz. That is, for a system running at a particular platform frequency (f_{CCB}), the ECn_MDC output clock frequency can be programmed between maximum $f_{MDC} = f_{CCB} \div 64$ and minimum $f_{MDC} = f_{CCB} \div 448$. See 14.5.3.6.6, "MII Management Configuration Register (MIIMCFG)," in the *MPC8548E PowerQUICC™ III Integrated Processor Family Reference Manual* for more detail.
3. The maximum ECn_MDC output clock frequency is defined based on the maximum platform frequency for device (533 MHz) divided by 64, while the minimum ECn_MDC output clock frequency is defined based on the minimum platform frequency for device (333 MHz) divided by 448, following the formula described in Note 2 above.
4. Guaranteed by design.
5. t_{CCB} is the platform (CCB) clock period.

Figure 21 shows the MII management AC timing diagram.

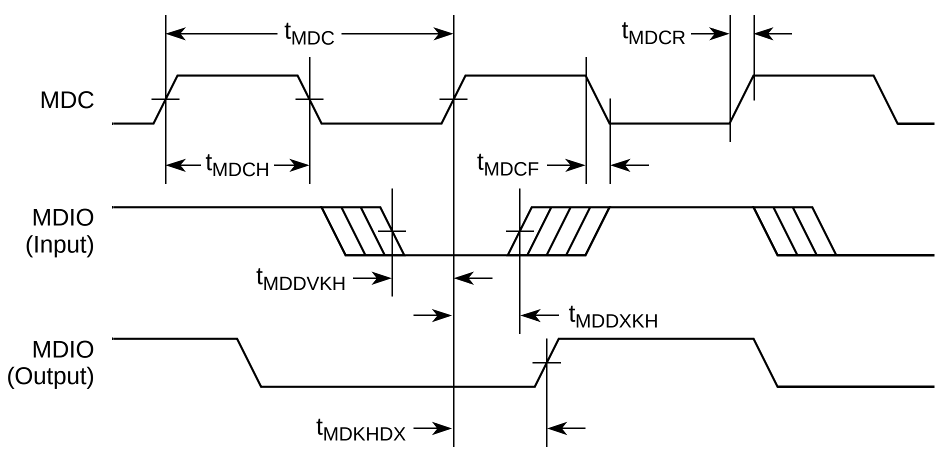

Figure 21. MII Management Interface Timing Diagram

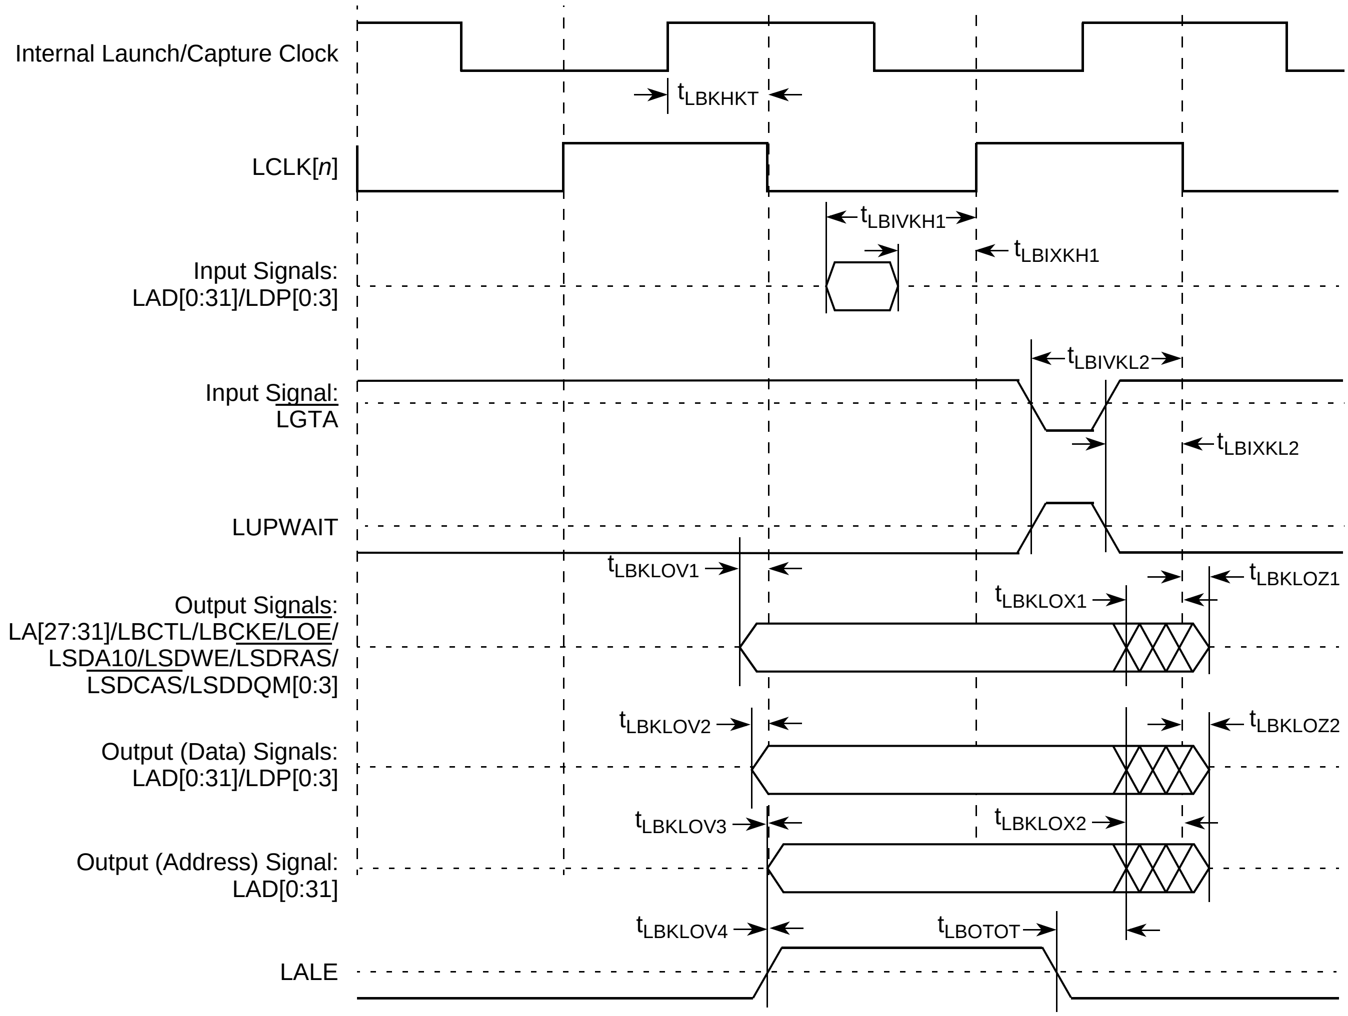

Figure 24. Local Bus Signals (PLL Bypass Mode)

NOTE

In PLL bypass mode, LCLK[*n*] is the inverted version of the internal clock with the delay of t_{LBKHKT}. In this mode, signals are launched at the rising edge of the internal clock and are captured at falling edge of the internal clock with the exception of $\overline{\text{LGTA}}$/LUPWAIT (which is captured on the rising edge of the internal clock).

Table 44. JTAG AC Timing Specifications (Independent of SYSCLK)[1] (continued)

Parameter	Symbol[2]	Min	Max	Unit	Notes
Valid times: Boundary-scan data TDO	 t_{JTKLDV} t_{JTKLOV}	 4 2	 20 10	ns	5
Output hold times: Boundary-scan data TDO	 t_{JTKLDX} t_{JTKLOX}	 30 30	 — —	ns	5
JTAG external clock to output high impedance: Boundary-scan data TDO	 t_{JTKLDZ} t_{JTKLOZ}	 3 3	 19 9	ns	5, 6

Notes:

1. All outputs are measured from the midpoint voltage of the falling/rising edge of t_{TCLK} to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50-Ω load (see Figure 29). Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
2. The symbols used for timing specifications follow the pattern of $t_{(first\ two\ letters\ of\ functional\ block)(signal)(state)(reference)(state)}$ for inputs and $t_{(first\ two\ letters\ of\ functional\ block)(reference)(state)(signal)(state)}$ for outputs. For example, t_{JTDVKH} symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{JTG} clock reference (K) going to the high (H) state or setup time. Also, t_{JTDXKH} symbolizes JTAG timing (JT) with respect to the time data input signals (D) went invalid (X) relative to the t_{JTG} clock reference (K) going to the high (H) state. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
3. $\overline{TRST}$ is an asynchronous level sensitive signal. The setup time is for test purposes only.
4. Non-JTAG signal input timing with respect to t_{TCLK}.
5. Non-JTAG signal output timing with respect to t_{TCLK}.
6. Guaranteed by design.

Figure 29 provides the AC test load for TDO and the boundary-scan outputs.

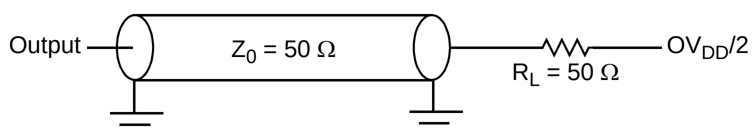

Figure 29. AC Test Load for the JTAG Interface

Figure 30 provides the JTAG clock input timing diagram.

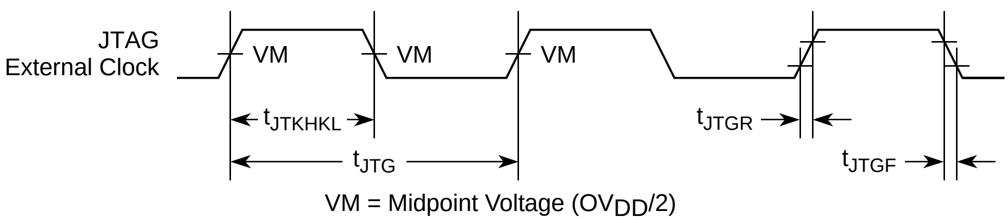

Figure 30. JTAG Clock Input Timing Diagram

Table 53. PCI-X AC Timing Specifications at 66 MHz (continued)

Parameter	Symbol	Min	Max	Unit	Notes
$\overline{\text{HRESET}}$ to PCI-X initialization pattern hold time	t_{PCRHIX}	0	50	ns	6, 11

Notes:

1. See the timing measurement conditions in the *PCI-X 1.0a Specification*.
2. Minimum times are measured at the package pin (not the test point). Maximum times are measured with the test point and load circuit.
3. Setup time for point-to-point signals applies to $\overline{\text{REQ}}$ and $\overline{\text{GNT}}$ only. All other signals are bused.
4. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
5. Setup time applies only when the device is not driving the pin. Devices cannot drive and receive signals at the same time.
6. Maximum value is also limited by delay to the first transaction (time for $\overline{\text{HRESET}}$ high to first configuration access, t_{PCRHFV}). The PCI-X initialization pattern control signals after the rising edge of $\overline{\text{HRESET}}$ must be negated no later than two clocks before the first $\overline{\text{FRAME}}$ and must be floated no later than one clock before $\overline{\text{FRAME}}$ is asserted.
7. A PCI-X device is permitted to have the minimum values shown for t_{PCKHOV} and t_{CYC} only in PCI-X mode. In conventional mode, the device must meet the requirements specified in PCI 2.2 for the appropriate clock frequency.
8. Device must meet this specification independent of how many outputs switch simultaneously.
9. The timing parameter t_{PCRHFV} is a minimum of 10 clocks rather than the minimum of 5 clocks in the *PCI-X 1.0a Specification.*
10. Guaranteed by characterization.
11. Guaranteed by design.

This table provides the PCI-X AC timing specifications at 133 MHz. Note that the maximum PCI-X frequency in synchronous mode is 110 MHz.

Table 54. PCI-X AC Timing Specifications at 133 MHz

Parameter	Symbol	Min	Max	Unit	Notes
SYSCLK to signal valid delay	t_{PCKHOV}	—	3.8	ns	1, 2, 3, 7, 8
Output hold from SYSCLK	t_{PCKHOX}	0.7	—	ns	1, 11
SYSCLK to output high impedance	t_{PCKHOZ}	—	7	ns	1, 4, 8, 12
Input setup time to SYSCLK	t_{PCIVKH}	1.2	—	ns	3, 5, 9, 11
Input hold time from SYSCLK	t_{PCIXKH}	0.5	—	ns	11
$\overline{\text{REQ64}}$ to $\overline{\text{HRESET}}$ setup time	t_{PCRVRH}	10	—	clocks	12
$\overline{\text{HRESET}}$ to $\overline{\text{REQ64}}$ hold time	t_{PCRHRX}	0	50	ns	12
$\overline{\text{HRESET}}$ high to first $\overline{\text{FRAME}}$ assertion	t_{PCRHFV}	10	—	clocks	10, 12
PCI-X initialization pattern to $\overline{\text{HRESET}}$ setup time	t_{PCIVRH}	10	—	clocks	12

Table 54. PCI-X AC Timing Specifications at 133 MHz (continued)

Parameter	Symbol	Min	Max	Unit	Notes
$\overline{\text{HRESET}}$ to PCI-X initialization pattern hold time	t_{PCRHIX}	0	50	ns	6, 12

Notes:

1. See the timing measurement conditions in the *PCI-X 1.0a Specification*.
2. Minimum times are measured at the package pin (not the test point). Maximum times are measured with the test point and load circuit.
3. Setup time for point-to-point signals applies to $\overline{\text{REQ}}$ and $\overline{\text{GNT}}$ only. All other signals are bused.
4. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
5. Setup time applies only when the device is not driving the pin. Devices cannot drive and receive signals at the same time.
6. Maximum value is also limited by delay to the first transaction (time for $\overline{\text{HRESET}}$ high to first configuration access, t_{PCRHFV}). The PCI-X initialization pattern control signals after the rising edge of $\overline{\text{HRESET}}$ must be negated no later than two clocks before the first $\overline{\text{FRAME}}$ and must be floated no later than one clock before $\overline{\text{FRAME}}$ is asserted.
7. A PCI-X device is permitted to have the minimum values shown for t_{PCKHOV} and t_{CYC} only in PCI-X mode. In conventional mode, the device must meet the requirements specified in PCI 2.2 for the appropriate clock frequency.
8. Device must meet this specification independent of how many outputs switch simultaneously.
9. The timing parameter t_{PCIVKH} is a minimum of 1.4 ns rather than the minimum of 1.2 ns in the *PCI-X 1.0a Specification.*
10. The timing parameter t_{PCRHFV} is a minimum of 10 clocks rather than the minimum of 5 clocks in the *PCI-X 1.0a Specification.*
11. Guaranteed by characterization.
12. Guaranteed by design.

The eye diagram must be valid for any 250 consecutive UIs.

A recovered TX UI is calculated over 3500 consecutive unit intervals of sample data. The eye diagram is created using all edges of the 250 consecutive UI in the center of the 3500 UI used for calculating the TX UI.

NOTE

The reference impedance for return loss measurements is 50. to ground for both the D+ and D– line (that is, as measured by a vector network analyzer with 50-Ω probes—see Figure 50). Note that the series capacitors, CTX, are optional for the return loss measurement.

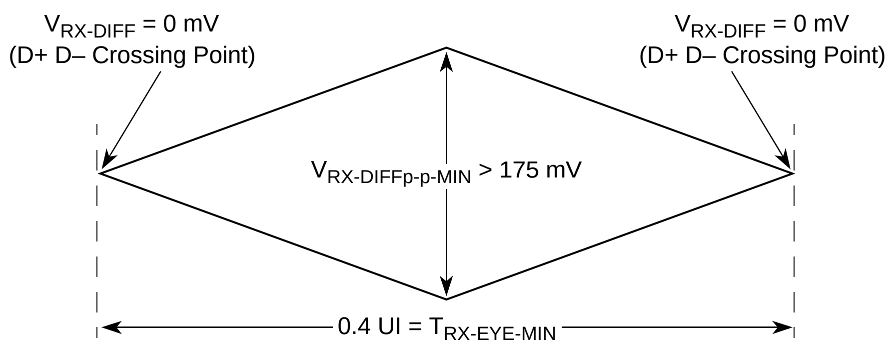

Figure 49. Minimum Receiver Eye Timing and Voltage Compliance Specification

17.5.1 Compliance Test and Measurement Load

The AC timing and voltage parameters must be verified at the measurement point, as specified within 0.2 inches of the package pins, into a test/measurement load shown in Figure 50.

NOTE

The allowance of the measurement point to be within 0.2 inches of the package pins is meant to acknowledge that package/board routing may benefit from D+ and D– not being exactly matched in length at the package pin boundary.

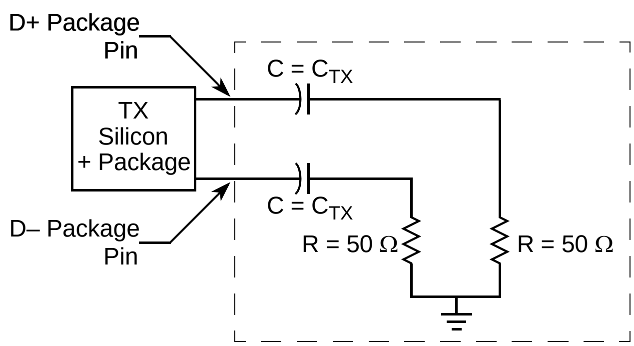

Figure 50. Compliance Test/Measurement Load

18 Serial RapidIO

This section describes the DC and AC electrical specifications for the RapidIO interface of the MPC8548E, for the LP-Serial physical layer. The electrical specifications cover both single- and multiple-lane links. Two transmitters (short and long run) and a single receiver are specified for each of three baud rates, 1.25, 2.50, and 3.125 GBaud.

Two transmitter specifications allow for solutions ranging from simple board-to-board interconnect to driving two connectors across a backplane. A single receiver specification is given that accepts signals from both the short- and long-run transmitter specifications.

The short-run transmitter must be used mainly for chip-to-chip connections on either the same printed-circuit board or across a single connector. This covers the case where connections are made to a mezzanine (daughter) card. The minimum swings of the short-run specification reduce the overall power used by the transceivers.

The long-run transmitter specifications use larger voltage swings that are capable of driving signals across backplanes. This allows a user to drive signals across two connectors and a backplane. The specifications allow a distance of at least 50 cm at all baud rates.

All unit intervals are specified with a tolerance of ±100 ppm. The worst case frequency difference between any transmit and receive clock is 200 ppm.

To ensure interoperability between drivers and receivers of different vendors and technologies, AC coupling at the receiver input must be used.

18.1 DC Requirements for Serial RapidIO SD_REF_CLK and SD_REF_CLK

For more information, see Section 16.2, “SerDes Reference Clocks.”

18.2 AC Requirements for Serial RapidIO SD_REF_CLK and SD_REF_CLK

Table 58 lists the Serial RapidIO SD_REF_CLK and $\overline{\text{SD\_REF\_CLK}}$ AC requirements.

Table 58. SD_REF_CLK and $\overline{\text{SD\_REF\_CLK}}$ AC Requirements

Symbol	Parameter Description	Min	Typ	Max	Unit	Comments
t_{REF}	REFCLK cycle time	—	10(8)	—	ns	8 ns applies only to serial RapidIO with 125-MHz reference clock
t_{REFCJ}	REFCLK cycle-to-cycle jitter. Difference in the period of any two adjacent REFCLK cycles.	—	—	80	ps	—
t_{REFPJ}	Phase jitter. Deviation in edge location with respect to mean edge location.	–40	—	40	ps	—

Table 73. MPC8545E Pinout Listing (continued)

Table 77. Processor Core Clocking Specifications (MPC8543E)

Characteristic	Maximum Processor Core Frequency				Unit	Notes
	800 MHz		1000 MHz			
	Min	Max	Min	Max		
e500 core processor frequency	800	800	800	1000	MHz	1, 2

Notes:
1. **Caution:** The CCB to SYSCLK ratio and e500 core to CCB ratio settings must be chosen such that the resulting SYSCLK frequency, e500 (core) frequency, and CCB frequency do not exceed their respective maximum or minimum operating frequencies. See Section 20.2, “CCB/SYSCLK PLL Ratio,” and Section 20.3, “e500 Core PLL Ratio,” for ratio settings.
2.)The minimum e500 core frequency is based on the minimum platform frequency of 333 MHz.

Table 78. Memory Bus Clocking Specifications (MPC8548E and MPC8547E)

Characteristic	Maximum Processor Core Frequency		Unit	Notes
	1000, 1200, 1333 MHz			
	Min	Max		
Memory bus clock speed	166	266	MHz	1, 2

Notes:
1. **Caution:** The CCB clock to SYSCLK ratio and e500 core to CCB clock ratio settings must be chosen such that the resulting SYSCLK frequency, e500 (core) frequency, and CCB clock frequency do not exceed their respective maximum or minimum operating frequencies. See Section 20.2, “CCB/SYSCLK PLL Ratio,” and Section 20.3, “e500 Core PLL Ratio,” for ratio settings.
2. The memory bus speed is half of the DDR/DDR2 data rate, hence, half of the platform clock frequency.

Table 79. Memory Bus Clocking Specifications (MPC8545E)

Characteristic	Maximum Processor Core Frequency		Unit	Notes
	800, 1000, 1200 MHz			
	Min	Max		
Memory bus clock speed	166	200	MHz	1, 2

Notes:
1. **Caution:** The CCB clock to SYSCLK ratio and e500 core to CCB clock ratio settings must be chosen such that the resulting SYSCLK frequency, e500 (core) frequency, and CCB clock frequency do not exceed their respective maximum or minimum operating frequencies. See Section 20.2, “CCB/SYSCLK PLL Ratio,” and Section 20.3, “e500 Core PLL Ratio,” for ratio settings.
2. The memory bus speed is half of the DDR/DDR2 data rate, hence, half of the platform clock frequency.

Table 80. Memory Bus Clocking Specifications (MPC8543E)

Characteristic	Maximum Processor Core Frequency		Unit	Notes
	800, 1000 MHz			
	Min	Max		
Memory bus clock speed	166	200	MHz	1, 2

Notes:

1. **Caution:** The CCB clock to SYSCLK ratio and e500 core to CCB clock ratio settings must be chosen such that the resulting SYSCLK frequency, e500 (core) frequency, and CCB clock frequency do not exceed their respective maximum or minimum operating frequencies. See Section 20.2, "CCB/SYSCLK PLL Ratio," and Section 20.3, "e500 Core PLL Ratio," for ratio settings.
2. The memory bus speed is half of the DDR/DDR2 data rate, hence, half of the platform clock frequency.

20.2 CCB/SYSCLK PLL Ratio

The CCB clock is the clock that drives the e500 core complex bus (CCB), and is also called the platform clock. The frequency of the CCB is set using the following reset signals, as shown in Table 81:

- SYSCLK input signal
- Binary value on LA[28:31] at power up

Note that there is no default for this PLL ratio; these signals must be pulled to the desired values. Also note that the DDR data rate is the determining factor in selecting the CCB bus frequency, since the CCB frequency must equal the DDR data rate.

For specifications on the PCI_CLK, see the *PCI 2.2 Specification*.

Table 81. CCB Clock Ratio

Binary Value of LA[28:31] Signals	CCB:SYSCLK Ratio	Binary Value of LA[28:31] Signals	CCB:SYSCLK Ratio
0000	16:1	1000	8:1
0001	Reserved	1001	9:1
0010	2:1	1010	10:1
0011	3:1	1011	Reserved
0100	4:1	1100	12:1
0101	5:1	1101	20:1
0110	6:1	1110	Reserved
0111	Reserved	1111	Reserved

level must always be equivalent to V_{DD}, and preferably these voltages are derived directly from V_{DD} through a low frequency filter scheme such as the following.

There are a number of ways to reliably provide power to the PLLs, but the recommended solution is to provide independent filter circuits per PLL power supply as illustrated in Figure 57, one to each of the AV_{DD} pins. By providing independent filters to each PLL the opportunity to cause noise injection from one PLL to the other is reduced.

This circuit is intended to filter noise in the PLLs resonant frequency range from a 500 kHz to 10 MHz range. It must be built with surface mount capacitors with minimum Effective Series Inductance (ESL). Consistent with the recommendations of Dr. Howard Johnson in *High Speed Digital Design: A Handbook of Black Magic* (Prentice Hall, 1993), multiple small capacitors of equal value are recommended over a single large value capacitor.

Each circuit must be placed as close as possible to the specific AV_{DD} pin being supplied to minimize noise coupled from nearby circuits. It must be routed directly from the capacitors to the AV_{DD} pin, which is on the periphery of the footprint, without the inductance of vias.

Figure 57 through Figure 59 shows the PLL power supply filter circuits.

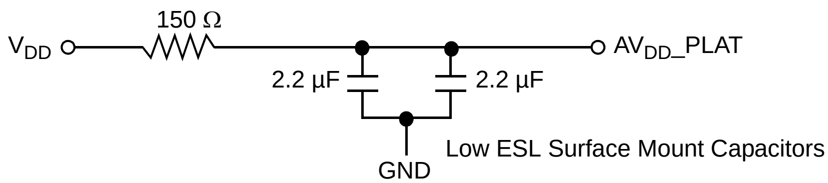

Figure 57. PLL Power Supply Filter Circuit with PLAT Pins

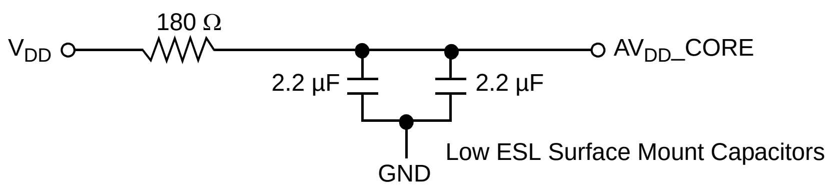

Figure 58. PLL Power Supply Filter Circuit with CORE Pins

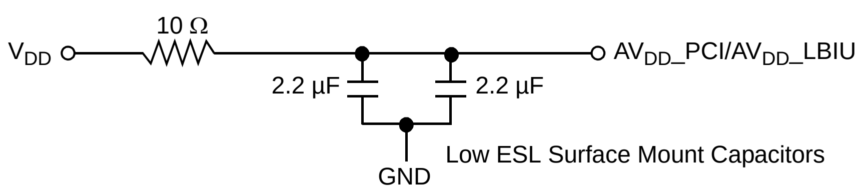

Figure 59. PLL Power Supply Filter Circuit with PCI/LBIU Pins

The AV_{DD}_SRDS signal provides power for the analog portions of the SerDes PLL. To ensure stability of the internal clock, the power supplied to the PLL is filtered using a circuit similar to the one shown in following figure. For maximum effectiveness, the filter circuit is placed as closely as possible to the AV_{DD}_SRDS ball to ensure it filters out as much noise as possible. The ground connection must be near the AV_{DD}_SRDS ball. The 0.003-µF capacitor is closest to the ball, followed by the two 2.2 µF capacitors, and finally the 1 Ω resistor to the board supply plane. The capacitors are connected from AV_{DD}_SRDS to
