
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e500
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	1.2GHz
Co-Processors/DSP	Signal Processing; SPE, Security; SEC
RAM Controllers	DDR, DDR2, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (4)
SATA	-
USB	-
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	Cryptography, Random Number Generator
Package / Case	783-BBGA, FCBGA
Supplier Device Package	783-FCBGA (29x29)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/mpc8548evuatg

4.5 Platform to FIFO Restrictions

Note the following FIFO maximum speed restrictions based on platform speed.

For FIFO GMII mode:

FIFO TX/RX clock frequency ≤ platform clock frequency/4.2

For example, if the platform frequency is 533 MHz, the FIFO TX/RX clock frequency must be no more than 127 MHz.

For FIFO encoded mode:

FIFO TX/RX clock frequency ≤ platform clock frequency/4.2

For example, if the platform frequency is 533 MHz, the FIFO TX/RX clock frequency must be no more than 167 MHz.

4.6 Platform Frequency Requirements for PCI-Express and Serial RapidIO

The CCB clock frequency must be considered for proper operation of the high-speed PCI-Express and Serial RapidIO interfaces as described below.

For proper PCI Express operation, the CCB clock frequency must be greater than:

$$\frac{527\text{ MHz} \times (\text{PCI-Express link width})}{8}$$

See *MPC8548ERM, Rev. 2*, *PowerQUICC III Integrated Processor Family Reference Manual*, Section 18.1.3.2, “Link Width,” for PCI Express interface width details.

For proper serial RapidIO operation, the CCB clock frequency must be greater than:

$$\frac{2 \times (0.80) \times (\text{Serial RapidIO interface frequency}) \times (\text{Serial RapidIO link width})}{64}$$

See *MPC8548ERM, Rev. 2*, *PowerQUICC III Integrated Processor Family Reference Manual*, Section 17.4, “1x/4x LP-Serial Signal Descriptions,” for serial RapidIO interface width and frequency details.

4.7 Other Input Clocks

For information on the input clocks of other functional blocks of the platform see the specific section of this document.

6.2.2 DDR SDRAM Output AC Timing Specifications

Table 19. DDR SDRAM Output AC Timing Specifications

At recommended operating conditions.

Parameter	Symbol[1]	Min	Max	Unit	Notes
MCK[n] cycle time, MCK[*n*]/$\overline{\text{MCK}}$[*n*] crossing	t_{MCK}	3.75	6	ns	2
ADDR/CMD output setup with respect to MCK 533 MHz 400 MHz 333 MHz	t_{DDKHAS}	 1.48 1.95 2.40	 — — —	ns	3
ADDR/CMD output hold with respect to MCK 533 MHz 400 MHz 333 MHz	t_{DDKHAX}	 1.48 1.95 2.40	 — — —	ns	3
$\overline{\text{MCS}}$[*n*] output setup with respect to MCK 533 MHz 400 MHz 333 MHz	t_{DDKHCS}	 1.48 1.95 2.40	 — — —	ns	3
$\overline{\text{MCS}}$[*n*] output hold with respect to MCK 533 MHz 400 MHz 333 MHz	t_{DDKHCX}	 1.48 1.95 2.40	 — — —	ns	3
MCK to MDQS Skew	t_{DDKHMH}	–0.6	0.6	ns	4
MDQ/MECC/MDM output setup with respect to MDQS 533 MHz 400 MHz 333 MHz	t_{DDKHDS}, t_{DDKLDS}	 538 700 900	 — — —	ps	5
MDQ/MECC/MDM output hold with respect to MDQS 533 MHz 400 MHz 333 MHz	t_{DDKHDX}, t_{DDKLDX}	 538 700 900	 — — —	ps	5
MDQS preamble start	t_{DDKHMP}	$-0.5 \times t_{MCK} - 0.6$	$-0.5 \times t_{MCK} + 0.6$	ns	6

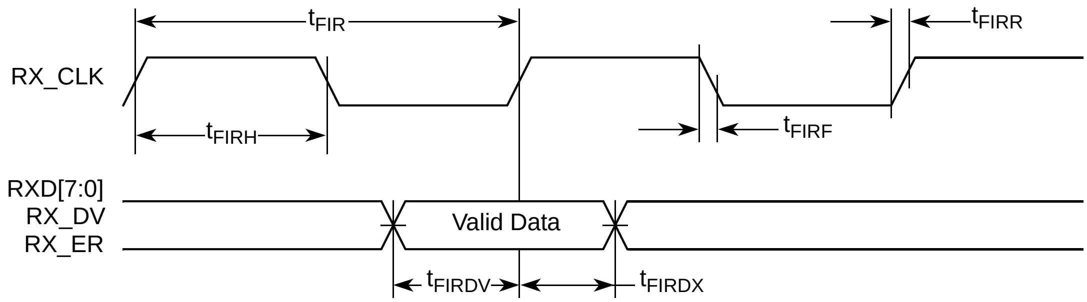

Figure 7. FIFO Receive AC Timing Diagram

8.2.2 GMII AC Timing Specifications

This section describes the GMII transmit and receive AC timing specifications.

8.2.2.1 GMII Transmit AC Timing Specifications

This table provides the GMII transmit AC timing specifications.

Table 26. GMII Transmit AC Timing Specifications

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
GMII data TXD[7:0], TX_ER, TX_EN setup time	t_{GTKHDV}	2.5	—	—	ns
GTX_CLK to GMII data TXD[7:0], TX_ER, TX_EN delay	t_{GTKHDX}	0.5	—	5.0	ns
GTX_CLK data clock rise time (20%–80%)	t_{GTXR}[2]	—	—	1.0	ns
GTX_CLK data clock fall time (80%–20%)	t_{GTXF}[2]	—	—	1.0	ns

Notes:

1. The symbols used for timing specifications follow the pattern $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{GTKHDV} symbolizes GMII transmit timing (GT) with respect to the t_{GTX} clock reference (K) going to the high state (H) relative to the time date input signals (D) reaching the valid state (V) to state or setup time. Also, t_{GTKHDX} symbolizes GMII transmit timing (GT) with respect to the t_{GTX} clock reference (K) going to the high state (H) relative to the time date input signals (D) going invalid (X) or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{GTX} represents the GMII(G) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Guaranteed by design.

13 I²C

This section describes the DC and AC electrical characteristics for the I²C interfaces of the device.

13.1 I²C DC Electrical Characteristics

This table provides the DC electrical characteristics for the I²C interfaces.

Table 45. I²C DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage level	V_{IH}	$0.7 \times OV_{DD}$	$OV_{DD} + 0.3$	V	—
Input low voltage level	V_{IL}	–0.3	$0.3 \times OV_{DD}$	V	—
Low level output voltage	V_{OL}	0	$0.2 \times OV_{DD}$	V	1
Pulse width of spikes which must be suppressed by the input filter	t_{I2KHKL}	0	50	ns	2
Input current each I/O pin (input voltage is between $0.1 \times OV_{DD}$ and $0.9 \times OV_{DD}$(max)	I_I	–10	10	μA	3
Capacitance for each I/O pin	C_I	—	10	pF	—

Notes:
1. Output voltage (open drain or open collector) condition = 3 mA sink current.
2. See the *MPC8548E PowerQUICC™ III Integrated Processor Family Reference Manual*, for information on the digital filter used.
3. I/O pins obstruct the SDA and SCL lines if OV_{DD} is switched off.

13.2 I²C AC Electrical Specifications

This table provides the AC timing parameters for the I²C interfaces.

Table 46. I²C AC Electrical Specifications

Parameter	Symbol[1]	Min	Max	Unit	Notes
SCL clock frequency	f_{I2C}	0	400	kHz	—
Low period of the SCL clock	t_{I2CL}	1.3	—	μs	4
High period of the SCL clock	t_{I2CH}	0.6	—	μs	4
Setup time for a repeated START condition	t_{I2SVKH}	0.6	—	μs	4
Hold time (repeated) START condition (after this period, the first clock pulse is generated)	t_{I2SXKL}	0.6	—	μs	4
Data setup time	t_{I2DVKH}	100	—	ns	4
Data input hold time: CBUS compatible masters I²C bus devices	t_{I2DXKL}	 — 0	 — —	μs	2
Data output delay time:	t_{I2OVKL}	—	0.9	—	3
Set-up time for STOP condition	t_{I2PVKH}	0.6	—	μs	—
Bus free time between a STOP and START condition	t_{I2KHDX}	1.3	—	μs	—

Table 46. I2C AC Electrical Specifications (continued)

Parameter	Symbol[1]	Min	Max	Unit	Notes
Noise margin at the LOW level for each connected device (including hysteresis)	V_{NL}	$0.1 \times OV_{DD}$	—	V	—
Noise margin at the HIGH level for each connected device (including hysteresis)	V_{NH}	$0.2 \times OV_{DD}$	—	V	—

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{I2DVKH} symbolizes I2C timing (I2) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{I2C} clock reference (K) going to the high (H) state or setup time. Also, t_{I2SXKL} symbolizes I2C timing (I2) for the time that the data with respect to the start condition (S) went invalid (X) relative to the t_{I2C} clock reference (K) going to the low (L) state or hold time. Also, t_{I2PVKH} symbolizes I2C timing (I2) for the time that the data with respect to the stop condition (P) reaching the valid state (V) relative to the t_{I2C} clock reference (K) going to the high (H) state or setup time. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. As a transmitter, the device provides a delay time of at least 300 ns for the SDA signal (see the V_{IH}(min) of the SCL signal) to bridge the undefined region of the falling edge of SCL to avoid unintended generation of Start or Stop condition. When the device acts as the I2C bus master while transmitting, the device drives both SCL and SDA. As long as the load on SCL and SDA are balanced, the device would not cause unintended generation of Start or Stop condition. Therefore, the 300 ns SDA output delay time is not a concern. If, under some rare condition, the 300 ns SDA output delay time is required for the device as a transmitter, the following setting is recommended for the FDR bit field of the I2CFDR register to ensure both the desired I2C SCL clock frequency and SDA output delay time are achieved, assuming that the desired I2C SCL clock frequency is 400 kHz and the Digital Filter Sampling Rate Register (I2CDFSRR) is programmed with its default setting of 0x10 (decimal 16):

I2C source clock frequency	333 MHz	266 MHz	200 MHz	133 MHz
FDR bit setting	0x2A	0x05	0x26	0x00
Actual FDR divider selected	896	704	512	384
Actual I2C SCL frequency generated	371 kHz	378 kHz	390 kHz	346 kHz

   For the detail of I2C frequency calculation, see *Determining the I2C Frequency Divider Ratio for SCL* (AN2919). Note that the I2C source clock frequency is half of the CCB clock frequency for the device.
3. The maximum t_{I2DXKL} has only to be met if the device does not stretch the LOW period (t_{I2CL}) of the SCL signal.
4. Guaranteed by design.

Figure 33 provides the AC test load for the I2C.

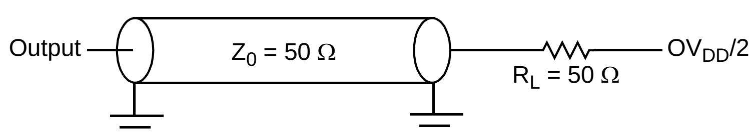

Figure 33. I2C AC Test Load

Table 54. PCI-X AC Timing Specifications at 133 MHz (continued)

Parameter	Symbol	Min	Max	Unit	Notes
$\overline{\text{HRESET}}$ to PCI-X initialization pattern hold time	t_{PCRHIX}	0	50	ns	6, 12

Notes:

1. See the timing measurement conditions in the *PCI-X 1.0a Specification*.
2. Minimum times are measured at the package pin (not the test point). Maximum times are measured with the test point and load circuit.
3. Setup time for point-to-point signals applies to $\overline{\text{REQ}}$ and $\overline{\text{GNT}}$ only. All other signals are bused.
4. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
5. Setup time applies only when the device is not driving the pin. Devices cannot drive and receive signals at the same time.
6. Maximum value is also limited by delay to the first transaction (time for $\overline{\text{HRESET}}$ high to first configuration access, t_{PCRHFV}). The PCI-X initialization pattern control signals after the rising edge of $\overline{\text{HRESET}}$ must be negated no later than two clocks before the first $\overline{\text{FRAME}}$ and must be floated no later than one clock before $\overline{\text{FRAME}}$ is asserted.
7. A PCI-X device is permitted to have the minimum values shown for t_{PCKHOV} and t_{CYC} only in PCI-X mode. In conventional mode, the device must meet the requirements specified in PCI 2.2 for the appropriate clock frequency.
8. Device must meet this specification independent of how many outputs switch simultaneously.
9. The timing parameter t_{PCIVKH} is a minimum of 1.4 ns rather than the minimum of 1.2 ns in the *PCI-X 1.0a Specification.*
10. The timing parameter t_{PCRHFV} is a minimum of 10 clocks rather than the minimum of 5 clocks in the *PCI-X 1.0a Specification.*
11. Guaranteed by characterization.
12. Guaranteed by design.

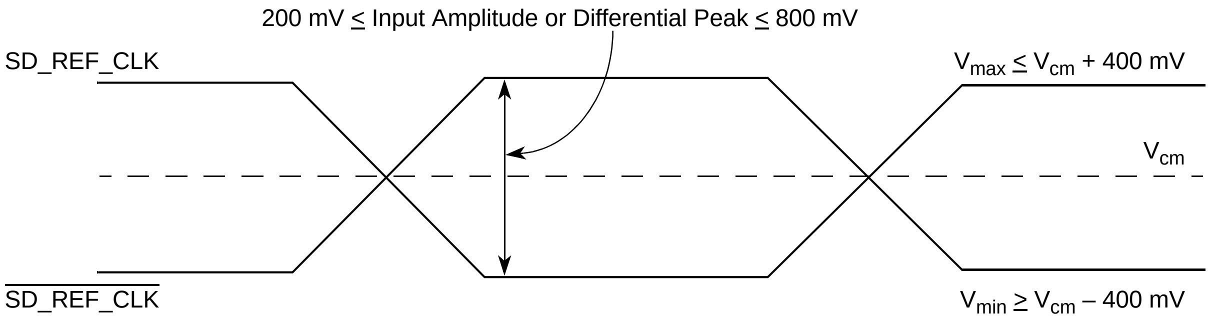

Figure 41. Differential Reference Clock Input DC Requirements (External AC-Coupled)

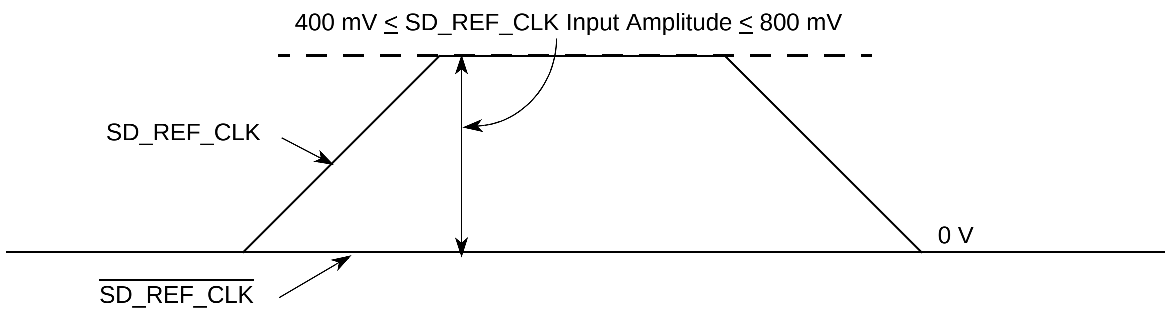

Figure 42. Single-Ended Reference Clock Input DC Requirements

16.2.3 Interfacing with Other Differential Signaling Levels

- With on-chip termination to SGND_SRDSn (xcorevss), the differential reference clocks inputs are HCSL (high-speed current steering logic) compatible DC-coupled.
- Many other low voltage differential type outputs like LVDS (low voltage differential signaling) can be used but may need to be AC-coupled due to the limited common mode input range allowed (100 to 400 mV) for DC-coupled connection.
- LVPECL outputs can produce signal with too large amplitude and may need to be DC-biased at clock driver output first, then followed with series attenuation resistor to reduce the amplitude, in addition to AC-coupling.

NOTE

Figure 43 through Figure 46 below are for conceptual reference only. Due to the fact that clock driver chip's internal structure, output impedance, and termination requirements are different between various clock driver chip manufacturers, it is very possible that the clock circuit reference designs provided by clock driver chip vendor are different from what is shown below. They might also vary from one vendor to the other. Therefore, Freescale Semiconductor can neither provide the optimal clock driver reference circuits, nor guarantee the correctness of the following clock driver connection reference circuits. The system designer is recommended to contact the selected clock driver chip vendor for the optimal reference circuits with the SerDes reference clock receiver requirement provided in this document.

Figure 43 shows the SerDes reference clock connection reference circuits for HCSL type clock driver. It assumes that the DC levels of the clock driver chip is compatible with SerDes reference clock input's DC requirement.

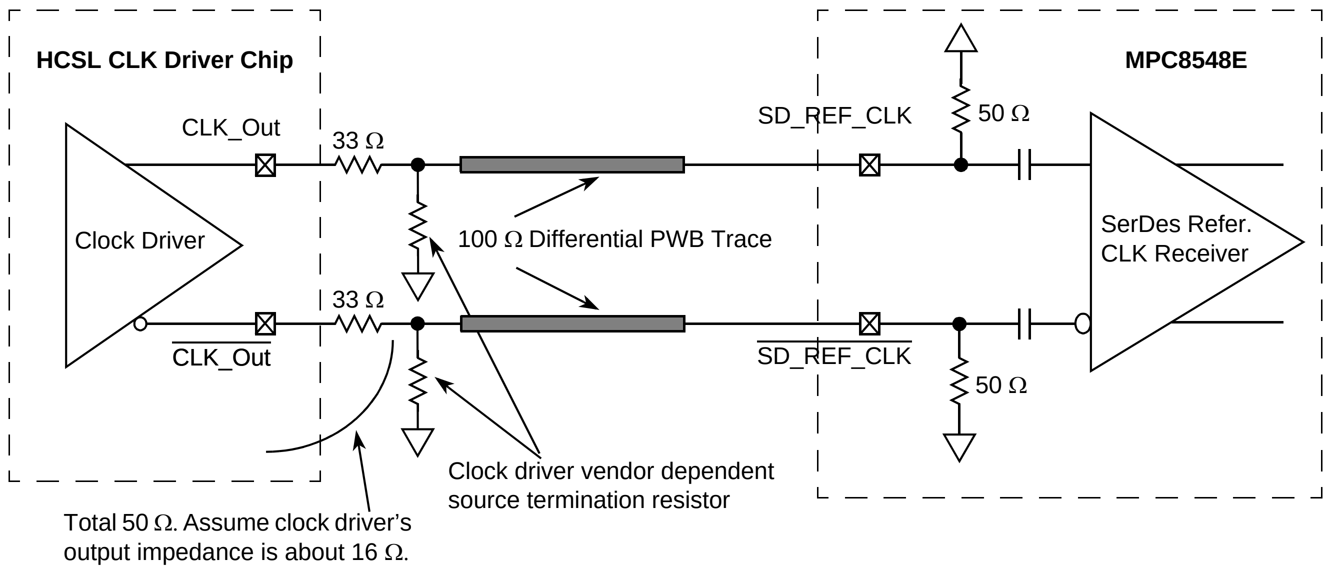

Figure 43. DC-Coupled Differential Connection with HCSL Clock Driver (Reference Only)

Figure 44 shows the SerDes reference clock connection reference circuits for LVDS type clock driver. Since LVDS clock driver's common mode voltage is higher than the SerDes reference clock input's allowed range (100–400 mV), AC-coupled connection scheme must be used. It assumes the LVDS output driver features 50-Ω termination resistor. It also assumes that the LVDS transmitter establishes its own common mode level without relying on the receiver or other external component.

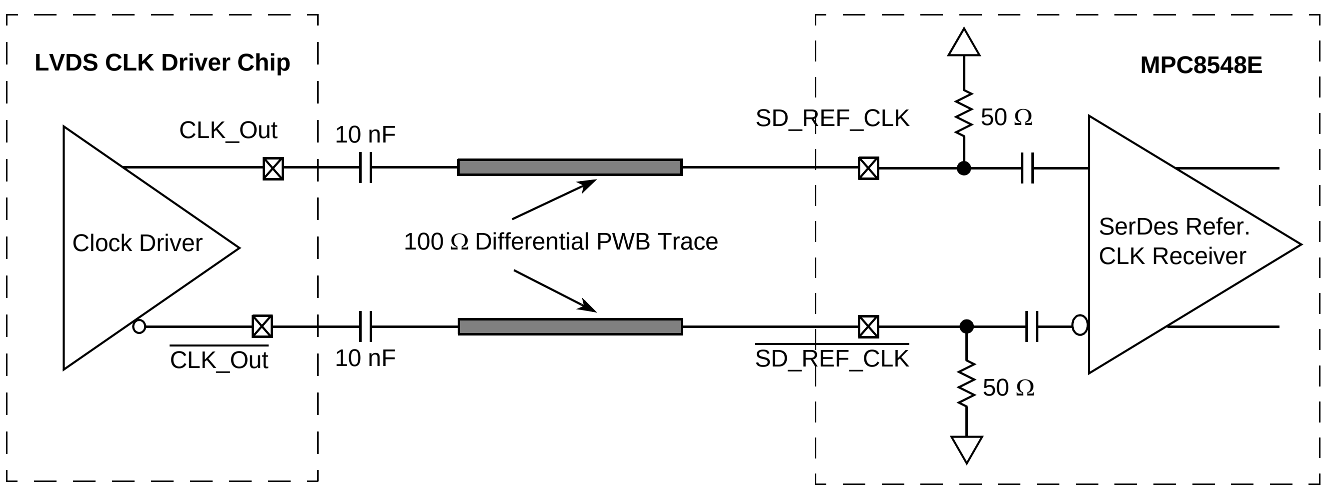

Figure 44. AC-Coupled Differential Connection with LVDS Clock Driver (Reference Only)

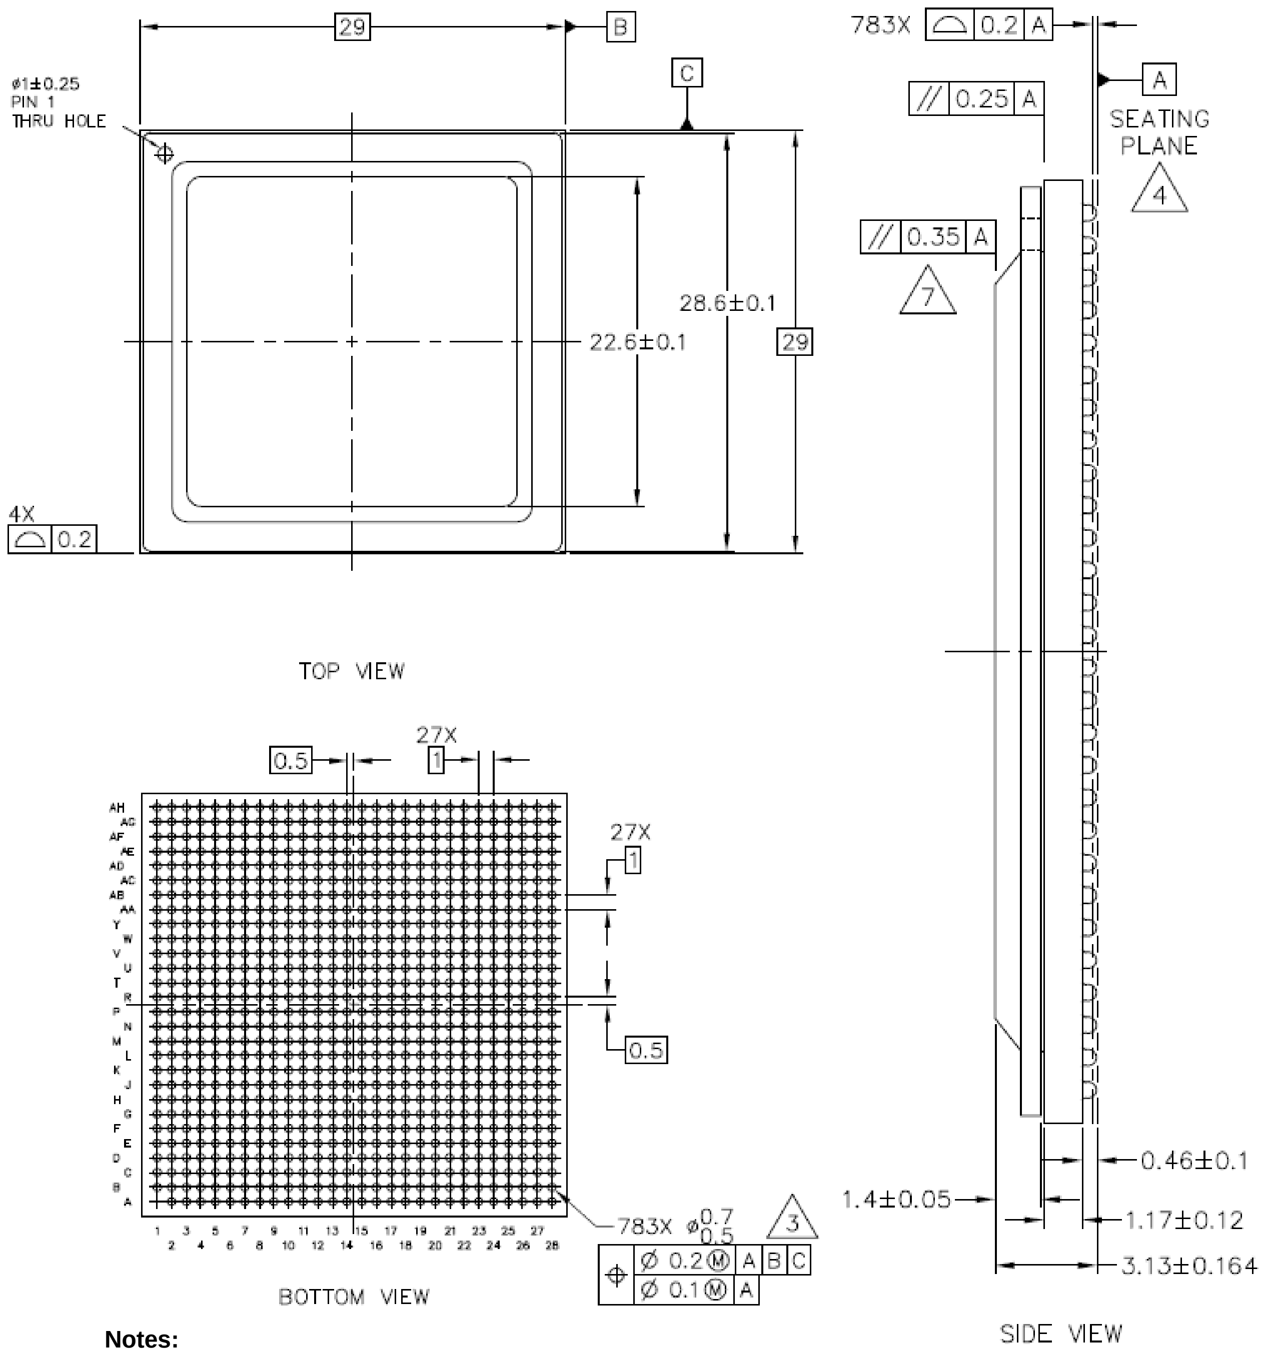
Figure 45 shows the SerDes reference clock connection reference circuits for LVPECL type clock driver. Since LVPECL driver's DC levels (both common mode voltages and output swing) are incompatible with the SerDes reference clock input's DC requirement, AC-coupling must be used. Figure 45 assumes that the LVPECL clock driver's output impedance is 50 Ω. R1 is used to DC-bias the LVPECL outputs prior

Notes:

1. All dimensions are in millimeters.
2. Dimensioning and tolerancing per ASME Y14.5M-1994.
3. Maximum solder ball diameter measured parallel to datum A.
4. Datum A, the seating plane, is determined by the spherical crowns of the solder balls.
5. Parallelism measurement shall exclude any effect of mark on top surface of package.
6. All dimensions are symmetric across the package center lines unless dimensioned otherwise.



Notes:

1. All dimensions are in millimeters.
2. Dimensioning and tolerancing per ASME Y14.5M-1994.
3. Maximum solder ball diameter measured parallel to datum A.
4. Datum A, the seating plane, is determined by the spherical crowns of the solder balls.
5. Capacitors may not be present on all devices.
6. Caution must be taken not to short capacitors or exposed metal capacitor pads on package top.
7. Parallelism measurement shall exclude any effect of mark on top surface of package.
8. All dimensions are symmetric across the package center lines unless dimensioned otherwise.

20 Clocking

This section describes the PLL configuration of the device. Note that the platform clock is identical to the core complex bus (CCB) clock.

20.1 Clock Ranges

Table 75 through Table 77 provide the clocking specifications for the processor cores and Table 78, through Table 80 provide the clocking specifications for the memory bus.

Table 75. Processor Core Clocking Specifications (MPC8548E and MPC8547E)

Characteristic	Maximum Processor Core Frequency						Unit	Notes
	1000 MHz		1200 MHz		1333 MHz			
	Min	Max	Min	Max	Min	Max		
e500 core processor frequency	800	1000	800	1200	800	1333	MHz	1, 2

Notes:

1. **Caution:** The CCB to SYSCLK ratio and e500 core to CCB ratio settings must be chosen such that the resulting SYSCLK frequency, e500 (core) frequency, and CCB frequency do not exceed their respective maximum or minimum operating frequencies. See Section 20.2, "CCB/SYSCLK PLL Ratio," and Section 20.3, "e500 Core PLL Ratio," for ratio settings.

2.)The minimum e500 core frequency is based on the minimum platform frequency of 333 MHz.

Table 76. Processor Core Clocking Specifications (MPC8545E)

Characteristic	Maximum Processor Core Frequency						Unit	Notes
	800 MHz		1000 MHz		1200 MHz			
	Min	Max	Min	Max	Min	Max		
e500 core processor frequency	800	800	800	1000	800	1200	MHz	1, 2

Notes:

1. **Caution:** The CCB to SYSCLK ratio and e500 core to CCB ratio settings must be chosen such that the resulting SYSCLK frequency, e500 (core) frequency, and CCB frequency do not exceed their respective maximum or minimum operating frequencies. See Section 20.2, "CCB/SYSCLK PLL Ratio," and Section 20.3, "e500 Core PLL Ratio," for ratio settings.

2.)The minimum e500 core frequency is based on the minimum platform frequency of 333 MHz.

20.3 e500 Core PLL Ratio

This table describes the clock ratio between the e500 core complex bus (CCB) and the e500 core clock. This ratio is determined by the binary value of LBCTL, LALE, and LGPL2 at power up, as shown in this table.

Table 82. e500 Core to CCB Clock Ratio

Binary Value of LBCTL, LALE, LGPL2 Signals	e500 core:CCB Clock Ratio	Binary Value of LBCTL, LALE, LGPL2 Signals	e500 core:CCB Clock Ratio
000	4:1	100	2:1
001	9:2	101	5:2
010	Reserved	110	3:1
011	3:2	111	7:2

20.4 Frequency Options

Table 83This table shows the expected frequency values for the platform frequency when using a CCB clock to SYSCLK ratio in comparison to the memory bus clock speed.

Table 83. Frequency Options of SYSCLK with Respect to Memory Bus Speeds

CCB to SYSCLK Ratio	SYSCLK (MHz)								
	16.66	**25**	**33.33**	**41.66**	**66.66**	**83**	**100**	**111**	**133.33**
	Platform/CCB Frequency (MHz)								
2									
3								333	400
4						333	400	445	533
5					333	415	500		
6					400	500			
8				333	533				
9				375					
10			333	417					
12			400	500					
16		400	533						
20	333	500							

Note: Due to errata Gen 13 the max sys clk frequency must not exceed 100 MHz if the core clk frequency is below 1200 MHz.

Table 85. Package Thermal Characteristics for FC-PBGA (continued)

Characteristic	JEDEC Board	Symbol	Value	Unit	Notes
Die junction-to-board	N/A	$R_{\theta JB}$	5	°C/W	3
Die junction-to-case	N/A	$R_{\theta JC}$	0.8	°C/W	4

Notes:
1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, airflow, power dissipation of other components on the board, and board thermal resistance.
2. Per JEDEC JESD51-6 with the board (JESD51-7) horizontal.
3. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
4. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1). The cold plate temperature is used for the case temperature, measured value includes the thermal resistance of the interface layer.

21.3 Heat Sink Solution

Every system application has different conditions that the thermal management solution must solve. As such, providing a recommended heat sink has not been found to be very useful. When a heat sink is chosen, give special consideration to the mounting technique. Mounting the heat sink to the printed-circuit board is the recommended procedure using a maximum of 10 lbs force (45 Newtons) perpendicular to the package and board. Clipping the heat sink to the package is not recommended.

22 System Design Information

This section provides electrical design recommendations for successful application of the device.

22.1 System Clocking

This device includes five PLLs, as follows:

1. The platform PLL generates the platform clock from the externally supplied SYSCLK input. The frequency ratio between the platform and SYSCLK is selected using the platform PLL ratio configuration bits as described in Section 20.2, “CCB/SYSCLK PLL Ratio.”
2. The e500 core PLL generates the core clock as a slave to the platform clock. The frequency ratio between the e500 core clock and the platform clock is selected using the e500 PLL ratio configuration bits as described in Section 20.3, “e500 Core PLL Ratio.”
3. The PCI PLL generates the clocking for the PCI bus.
4. The local bus PLL generates the clock for the local bus.
5. There is a PLL for the SerDes block.

22.2 PLL Power Supply Filtering

Each of the PLLs listed above is provided with power through independent power supply pins (AV_{DD}_PLAT, AV_{DD}_CORE, AV_{DD}_PCI, AV_{DD}_LBIU, and AV_{DD}_SRDS, respectively). The AV_{DD}

- $\overline{\text{SD\_REF\_CLK}}$

NOTE

It is recommended to power down the unused lane through SRDSCR1[0:7] register (offset = 0xE_0F08) (this prevents the oscillations and holds the receiver output in a fixed state) that maps to SERDES lane 0 to lane 7 accordingly.

Pins V28 and M26 must be tied to XV_{DD}. Pins V27 and M25 must be tied to GND through a 300-Ω resistor.

22.11 Guideline for PCI Interface Termination

PCI termination if PCI 1 or PCI 2 is not used at all.

Option 1

If PCI arbiter is enabled during POR:

- All AD pins are driven to the stable states after POR. Therefore, all ADs pins can be floating.
- All PCI control pins can be grouped together and tied to OV_{DD} through a single 10-kΩ resistor.
- It is optional to disable PCI block through DEVDISR register after POR reset.

Option 2

If PCI arbiter is disabled during POR:

- All AD pins are in the input state. Therefore, all ADs pins need to be grouped together and tied to OV_{DD} through a single (or multiple) 10-kΩ resistor(s).
- All PCI control pins can be grouped together and tied to OV_{DD} through a single 10-kΩ resistor.
- It is optional to disable PCI block through DEVDISR register after POR reset.

22.12 Guideline for LBIU Termination

If the LBIU parity pins are not used, the following is the termination recommendation:

- For LDP[0:3]—tie them to ground or the power supply rail via a 4.7-kΩ resistor.
- For LPBSE—tie it to the power supply rail via a 4.7-kΩ resistor (pull-up resistor).
