Infineon Technologies - XC2237M104F80LAAHXUMA1 Datasheet

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	C166SV2
Core Size	16/32-Bit
Speed	80MHz
Connectivity	CANbus, EBI/EMI, I²C, LINbus, SPI, SSC, UART/USART, USI
Peripherals	I²S, POR, PWM, WDT
Number of I/O	38
Program Memory Size	832KB (832K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	50K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	A/D 9x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 110°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	PG-LQFP-64-13
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/xc2237m104f80laahxuma1

16/32-Bit Single-Chip Microcontroller with 32-Bit Performance

XC223xM (XC2000 Family)

1 Summary of Features

For a quick overview and easy reference, the features of the XC223xM are summarized here.

- High-performance CPU with five-stage pipeline and MPU
  - 12.5 ns instruction cycle at 80 MHz CPU clock (single-cycle execution)
  - One-cycle 32-bit addition and subtraction with 40-bit result
  - One-cycle multiplication (16 × 16 bit)
  - Background division (32 / 16 bit) in 21 cycles
  - One-cycle multiply-and-accumulate (MAC) instructions
  - Enhanced Boolean bit manipulation facilities
  - Zero-cycle jump execution
  - Additional instructions to support HLL and operating systems
  - Register-based design with multiple variable register banks
  - Fast context switching support with two additional local register banks
  - 16 Mbytes total linear address space for code and data
  - 1024 Bytes on-chip special function register area (C166 Family compatible)
  - Integrated Memory Protection Unit (MPU)
- Interrupt system with 16 priority levels for up to 96 sources
  - Selectable external inputs for interrupt generation and wake-up
  - Fastest sample-rate 12.5 ns
- Eight-channel interrupt-driven single-cycle data transfer with Peripheral Event Controller (PEC), 24-bit pointers cover total address space
- Clock generation from internal or external clock sources, using on-chip PLL or prescaler
- Hardware CRC-Checker with Programmable Polynomial to Supervise On-Chip Memory Areas
- On-chip memory modules
  - 8 Kbytes on-chip stand-by RAM (SBRAM)
  - 2 Kbytes on-chip dual-port RAM (DPRAM)
  - Up to 16 Kbytes on-chip data SRAM (DSRAM)
  - Up to 32 Kbytes on-chip program/data SRAM (PSRAM)
  - Up to 832 Kbytes on-chip program memory (Flash memory)
  - Memory content protection through Error Correction Code (ECC)
- On-Chip Peripheral Modules
  - Multi-functional general purpose timer unit with 5 timers
  - 16-channel general purpose capture/compare unit (CAPCOM2)
  - Two capture/compare units for flexible PWM signal generation (CCU6x)

Ordering Information

The ordering code for an Infineon microcontroller provides an exact reference to a specific product. This ordering code identifies:

- the function set of the corresponding product type
- the temperature range:
  - SAF-…: -40°C to 85°C
  - SAH-…: -40°C to 110°C
- the package and the type of delivery.

For ordering codes for the XC223xM please contact your sales representative or local distributor.

This document describes several derivatives of the XC223xM group:

Basic Device Types are readily available and
Special Device Types are only available on request.

As this document refers to all of these derivatives, some descriptions may not apply to a specific product, in particular to the special device types.

For simplicity the term **XC223xM** is used for all derivatives throughout this document.

1.1 Basic Device Types

Basic device types are available and can be ordered through Infineon's direct and/or distribution channels.

Table 1 Synopsis of XC223xM Basic Device Types

Derivative[1]	Flash Memory[2]	PSRAM DSRAM[3]	Capt./Comp. Modules	ADC[4] Chan.	Interfaces[4]
XC2237M-104FxxL	832 Kbytes	32 Kbytes 16 Kbytes	CC2 CCU60/3	7 + 2	6 CAN Nodes 6 Serial Chan.

1) xx is a placeholder for the available speed grade (in MHz).

2) Specific information about the on-chip Flash memory in **Table 3**.

3) All derivatives additionally provide 8 Kbytes SBRAM and 2 Kbytes DPRAM.

4) Specific information about the available channels in **Table 5**.
Analog input channels are listed for each Analog/Digital Converter module separately (ADC0 + ADC1).

Key to Pin Definitions

- **Ctrl.**: The output signal for a port pin is selected by bit field PC in the associated register Px_IOCRy. Output O0 is selected by setting the respective bit field PC to $1x00_B$, output O1 is selected by $1x01_B$, etc.
  Output signal OH is controlled by hardware.
- **Type**: Indicates the pad type and its power supply domain (A, B, M, 1).
  - St: Standard pad
  - Sp: Special pad e.g. XTALx
  - DP: Double pad - can be used as standard or high speed pad
  - In: Input only pad
  - PS: Power supply pad

Table 6 Pin Definitions and Functions

Pin	Symbol	Ctrl.	Type	Function
3	$\overline{\text{TESTM}}$	I	In/B	**Testmode Enable** Enables factory test modes, must be held HIGH for normal operation (connect to V_{DDPB}). An internal pull-up device will hold this pin high when nothing is driving it.
4	$\overline{\text{TRST}}$	I	In/B	**Test-System Reset Input** For normal system operation, pin $\overline{\text{TRST}}$ should be held low. A high level at this pin at the rising edge of $\overline{\text{PORST}}$ activates the XC223xM's debug system. In this case, pin $\overline{\text{TRST}}$ must be driven low once to reset the debug system. An internal pull-down device will hold this pin low when nothing is driving it.
5	P7.0	O0 / I	St/B	**Bit 0 of Port 7, General Purpose Input/Output**
	T3OUT	O1	St/B	**GPT12E Timer T3 Toggle Latch Output**
	T6OUT	O2	St/B	**GPT12E Timer T6 Toggle Latch Output**
	TDO_A	OH / IH	St/B	**JTAG Test Data Output / DAP1 Input/Output** If DAP pos. 0 or 2 is selected during start-up, an internal pull-down device will hold this pin low when nothing is driving it.
	ESR2_1	I	St/B	**ESR2 Trigger Input 1**
	RxDC4B	I	St/B	**CAN Node 4 Receive Data Input**

Table 6 Pin Definitions and Functions (cont'd)

Pin	Symbol	Ctrl.	Type	Function
19	P5.4	I	In/A	**Bit 4 of Port 5, General Purpose Input**
	ADC0_CH4	I	In/A	**Analog Input Channel 4 for ADC0**
	T3EUDA	I	In/A	**GPT12E Timer T3 External Up/Down Control Input**
	TMS_A	I	In/A	**JTAG Test Mode Selection Input**
20	P5.8	I	In/A	**Bit 8 of Port 5, General Purpose Input**
	ADC0_CH8	I	In/A	**Analog Input Channel 8 for ADC0**
	ADC1_CH8	I	In/A	**Analog Input Channel 8 for ADC1**
	CCU6x_T12HRC	I	In/A	**External Run Control Input for T12 of CCU60/1**
	CCU6x_T13HRC	I	In/A	**External Run Control Input for T13 of CCU60/1**
	U2C0_DX0F	I	In/A	**USIC2 Channel 0 Shift Data Input**
21	P5.10	I	In/A	**Bit 10 of Port 5, General Purpose Input**
	ADC0_CH10	I	In/A	**Analog Input Channel 10 for ADC0**
	ADC1_CH10	I	In/A	**Analog Input Channel 10 for ADC1**
	$\overline{\text{BRKIN\_A}}$	I	In/A	**OCDS Break Signal Input**
	U2C1_DX0F	I	In/A	**USIC2 Channel 1 Shift Data Input**
	CCU61_T13HRA	I	In/A	**External Run Control Input for T13 of CCU61**
22	P5.13	I	In/A	**Bit 13 of Port 5, General Purpose Input**
	ADC0_CH13	I	In/A	**Analog Input Channel 13 for ADC0**
23	P5.15	I	In/A	**Bit 15 of Port 5, General Purpose Input**
	ADC0_CH15	I	In/A	**Analog Input Channel 15 for ADC0**
	RxDC2F	I	In/A	**CAN Node 2 Receive Data Input**
25	P2.0	O0 / I	St/B	**Bit 0 of Port 2, General Purpose Input/Output**
	TxDC5	O1	St/B	**CAN Node 5 Transmit Data Output**
	RxDC0C	I	St/B	**CAN Node 0 Receive Data Input**
	T5INB	I	St/B	**GPT12E Timer T5 Count/Gate Input**

Table 6 Pin Definitions and Functions (cont'd)

Pin	Symbol	Ctrl.	Type	Function
53	P10.10	O0 / I	St/B	**Bit 10 of Port 10, General Purpose Input/Output**
	U0C0_SELO 0	O1	St/B	**USIC0 Channel 0 Select/Control 0 Output**
	CCU60_COU T63	O2	St/B	**CCU60 Channel 3 Output**
	U0C0_DX2C	I	St/B	**USIC0 Channel 0 Shift Control Input**
	U0C1_DX1A	I	St/B	**USIC0 Channel 1 Shift Clock Input**
	TDI_B	IH	St/B	**JTAG Test Data Input** If JTAG pos. B is selected during start-up, an internal pull-up device will hold this pin high when nothing is driving it.
54	P10.11	O0 / I	St/B	**Bit 11 of Port 10, General Purpose Input/Output**
	U1C0_SCLK OUT	O1	St/B	**USIC1 Channel 0 Shift Clock Output**
	$\overline{\text{BRKOUT}}$	O2	St/B	**OCDS Break Signal Output**
	U1C0_DX1D	I	St/B	**USIC1 Channel 0 Shift Clock Input**
	RxDC2B	I	St/B	**CAN Node 2 Receive Data Input**
	TMS_B	IH	St/B	**JTAG Test Mode Selection Input** If JTAG pos. B is selected during start-up, an internal pull-up device will hold this pin high when nothing is driving it.
55	P10.12	O0 / I	St/B	**Bit 12 of Port 10, General Purpose Input/Output**
	U1C0_DOUT	O1	St/B	**USIC1 Channel 0 Shift Data Output**
	TxDC2	O2	St/B	**CAN Node 2 Transmit Data Output**
	TDO_B	OH / IH	St/B	**JTAG Test Data Output / DAP1 Input/Output** If DAP pos. 1 is selected during start-up, an internal pull-down device will hold this pin low when nothing is driving it.
	U1C0_DX0C	I	St/B	**USIC1 Channel 0 Shift Data Input**
	U1C0_DX1E	I	St/B	**USIC1 Channel 0 Shift Clock Input**

to a dedicated vector table location). The occurrence of a hardware trap is also indicated by a single bit in the trap flag register (TFR). Unless another higher-priority trap service is in progress, a hardware trap will interrupt any ongoing program execution. In turn, hardware trap services can normally not be interrupted by standard or PEC interrupts.

Depending on the package option up to 3 External Service Request (ESR) pins are provided. The ESR unit processes their input values and allows to implement user controlled trap functions (System Requests SR0 and SR1). In this way reset, wakeup and power control can be efficiently realized.

Software interrupts are supported by the 'TRAP' instruction in combination with an individual trap (interrupt) number. Alternatively to emulate an interrupt by software a program can trigger interrupt requests by writing the Interrupt Request (IR) bit of an interrupt control register.

3.6 On-Chip Debug Support (OCDS)

The On-Chip Debug Support system built into the XC223xM provides a broad range of debug and emulation features. User software running on the XC223xM can be debugged within the target system environment.

The OCDS is controlled by an external debugging device via the debug interface. This either consists of the 2-pin Device Access Port (DAP) or of the JTAG port conforming to IEEE-1149. The debug interface can be completed with an optional break interface.

The debugger controls the OCDS with a set of dedicated registers accessible via the debug interface (DAP or JTAG). In addition the OCDS system can be controlled by the CPU, e.g. by a monitor program. An injection interface allows the execution of OCDS-generated instructions by the CPU.

Multiple breakpoints can be triggered by on-chip hardware, by software, or by an external trigger input. Single stepping is supported, as is the injection of arbitrary instructions and read/write access to the complete internal address space. A breakpoint trigger can be answered with a CPU halt, a monitor call, a data transfer, or/and the activation of an external signal.

Tracing data can be obtained via the debug interface, or via the external bus interface for increased performance.

Tracing of program execution is supported by the XC2000 Family emulation device.

The DAP interface uses two interface signals, the JTAG interface uses four interface signals, to communicate with external circuitry. The debug interface can be amended with two optional break lines.

3.7 Capture/Compare Unit (CAPCOM2)

The CAPCOM2 unit supports generation and control of timing sequences on up to 16 channels with a maximum resolution of one system clock cycle (eight cycles in staggered mode). The CAPCOM2 unit is typically used to handle high-speed I/O tasks such as pulse and waveform generation, pulse width modulation (PWM), digital to analog (D/A) conversion, software timing, or time recording with respect to external events.

Two 16-bit timers (T7/T8) with reload registers provide two independent time bases for the capture/compare register array.

The input clock for the timers is programmable to several prescaled values of the internal system clock, or may be derived from an overflow/underflow of timer T6 in module GPT2. This provides a wide range or variation for the timer period and resolution and allows precise adjustments to the application-specific requirements. In addition, an external count input allows event scheduling for the capture/compare registers relative to external events.

The capture/compare register array contains 16 dual purpose capture/compare registers, each of which may be individually allocated to either CAPCOM timer and programmed for capture or compare function.
All registers have each one port pin associated with it which serves as an input pin for triggering the capture function, or as an output pin to indicate the occurrence of a compare event.

When a capture/compare register has been selected for capture mode, the current contents of the allocated timer will be latched (‘captured’) into the capture/compare register in response to an external event at the port pin which is associated with this register. In addition, a specific interrupt request for this capture/compare register is generated. Either a positive, a negative, or both a positive and a negative external signal transition at the pin can be selected as the triggering event.

The contents of all registers which have been selected for one of the five compare modes are continuously compared with the contents of the allocated timers.

When a match occurs between the timer value and the value in a capture/compare register, specific actions will be taken based on the selected compare mode.

Table 9 Compare Modes

Compare Modes	Function
Mode 0	Interrupt-only compare mode; Several compare interrupts per timer period are possible
Mode 1	Pin toggles on each compare match; Several compare events per timer period are possible

3.11 A/D Converters

For analog signal measurement, up to two 10-bit A/D converters (ADC0, ADC1) with 7 + 2 multiplexed input channels and a sample and hold circuit have been integrated on-chip. 2 inputs can be converted by both A/D converters. Conversions use the successive approximation method. The sample time (to charge the capacitors) and the conversion time are programmable so that they can be adjusted to the external circuit. The A/D converters can also operate in 8-bit conversion mode, further reducing the conversion time.

Several independent conversion result registers, selectable interrupt requests, and highly flexible conversion sequences provide a high degree of programmability to meet the application requirements. Both modules can be synchronized to allow parallel sampling of two input channels.

For applications that require more analog input channels, external analog multiplexers can be controlled automatically. For applications that require fewer analog input channels, the remaining channel inputs can be used as digital input port pins.

The A/D converters of the XC223xM support two types of request sources which can be triggered by several internal and external events.

- Parallel requests are activated at the same time and then executed in a predefined sequence.
- Queued requests are executed in a user-defined sequence.

In addition, the conversion of a specific channel can be inserted into a running sequence without disturbing that sequence. All requests are arbitrated according to the priority level assigned to them.

Data reduction features reduce the number of required CPU access operations allowing the precise evaluation of analog inputs (high conversion rate) even at a low CPU speed. Result data can be reduced by limit checking or accumulation of results.

The Peripheral Event Controller (PEC) can be used to control the A/D converters or to automatically store conversion results to a table in memory for later evaluation, without requiring the overhead of entering and exiting interrupt routines for each data transfer. Each A/D converter contains eight result registers which can be concatenated to build a result FIFO. Wait-for-read mode can be enabled for each result register to prevent the loss of conversion data.

In order to decouple analog inputs from digital noise and to avoid input trigger noise, those pins used for analog input can be disconnected from the digital input stages. This can be selected for each pin separately with the Port x Digital Input Disable registers.

The Auto-Power-Down feature of the A/D converters minimizes the power consumption when no conversion is in progress.

Broken wire detection for each channel and a multiplexer test mode provide information to verify the proper operation of the analog signal sources (e.g. a sensor system).

3.12 Universal Serial Interface Channel Modules (USIC)

The XC223xM features the USIC modules USIC0, USIC1, USIC2. Each module provides two serial communication channels.

The Universal Serial Interface Channel (USIC) module is based on a generic data shift and data storage structure which is identical for all supported serial communication protocols. Each channel supports complete full-duplex operation with a basic data buffer structure (one transmit buffer and two receive buffer stages). In addition, the data handling software can use FIFOs.

The protocol part (generation of shift clock/data/control signals) is independent of the general part and is handled by protocol-specific preprocessors (PPPs).

The USIC's input/output lines are connected to pins by a pin routing unit. The inputs and outputs of each USIC channel can be assigned to different interface pins, providing great flexibility to the application software. All assignments can be made during runtime.

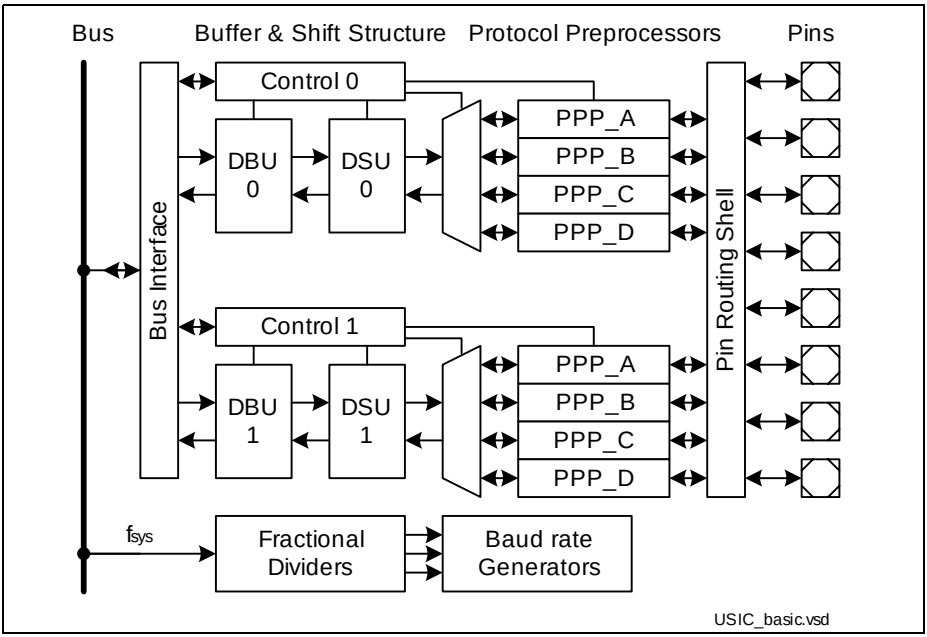

Figure 11 General Structure of a USIC Module

The regular structure of the USIC module brings the following advantages:

- Higher flexibility through configuration with same look-and-feel for data management
- Reduced complexity for low-level drivers serving different protocols
- Wide range of protocols with improved performances (baud rate, buffer handling)

3.15 Watchdog Timer

The Watchdog Timer is one of the fail-safe mechanisms which have been implemented to prevent the controller from malfunctioning for longer periods of time.

The Watchdog Timer is always enabled after an application reset of the chip. It can be disabled and enabled at any time by executing the instructions DISWDT and ENWDT respectively. The software has to service the Watchdog Timer before it overflows. If this is not the case because of a hardware or software failure, the Watchdog Timer overflows, generating a prewarning interrupt and then a reset request.

The Watchdog Timer is a 16-bit timer clocked with the system clock divided by 16,384 or 256. The Watchdog Timer register is set to a prespecified reload value (stored in WDTREL) in order to allow further variation of the monitored time interval. Each time it is serviced by the application software, the Watchdog Timer is reloaded and the prescaler is cleared.

Time intervals between 3.2 µs and 13.42 s can be monitored (@ 80 MHz).
The default Watchdog Timer interval after power-up is 6.5 ms (@ 10 MHz).

3.16 Clock Generation

The Clock Generation Unit can generate the system clock signal f_{SYS} for the XC223xM from a number of external or internal clock sources:

- External clock signals with pad voltage or core voltage levels
- External crystal or resonator using the on-chip oscillator
- On-chip clock source for operation without crystal/resonator
- Wake-up clock (ultra-low-power) to further reduce power consumption

The programmable on-chip PLL with multiple prescalers generates a clock signal for maximum system performance from standard crystals, a clock input signal, or from the on-chip clock source. See also **Section 4.6.2**.

The Oscillator Watchdog (OWD) generates an interrupt if the crystal oscillator frequency falls below a certain limit or stops completely. In this case, the system can be supplied with an emergency clock to enable operation even after an external clock failure.

All available clock signals can be output on one of two selectable pins.

Table 11 Instruction Set Summary (cont'd)

Mnemonic	Description	Bytes
NOP	Null operation	2
CoMUL/CoMAC	Multiply (and accumulate)	4
CoADD/CoSUB	Add/Subtract	4
Co(A)SHR	(Arithmetic) Shift right	4
CoSHL	Shift left	4
CoLOAD/STORE	Load accumulator/Store MAC register	4
CoCMP	Compare	4
CoMAX/MIN	Maximum/Minimum	4
CoABS/CoRND	Absolute value/Round accumulator	4
CoMOV	Data move	4
CoNEG/NOP	Negate accumulator/Null operation	4

1) The Enter Power Down Mode instruction is not used in the XC223xM, due to the enhanced power control scheme. PWRDN will be correctly decoded, but will trigger no action.

Pullup/Pulldown Device Behavior

Most pins of the XC223xM feature pullup or pulldown devices. For some special pins these are fixed; for the port pins they can be selected by the application.

The specified current values indicate how to load the respective pin depending on the intended signal level. **Figure 13** shows the current paths.

The shaded resistors shown in the figure may be required to compensate system pull currents that do not match the given limit values.

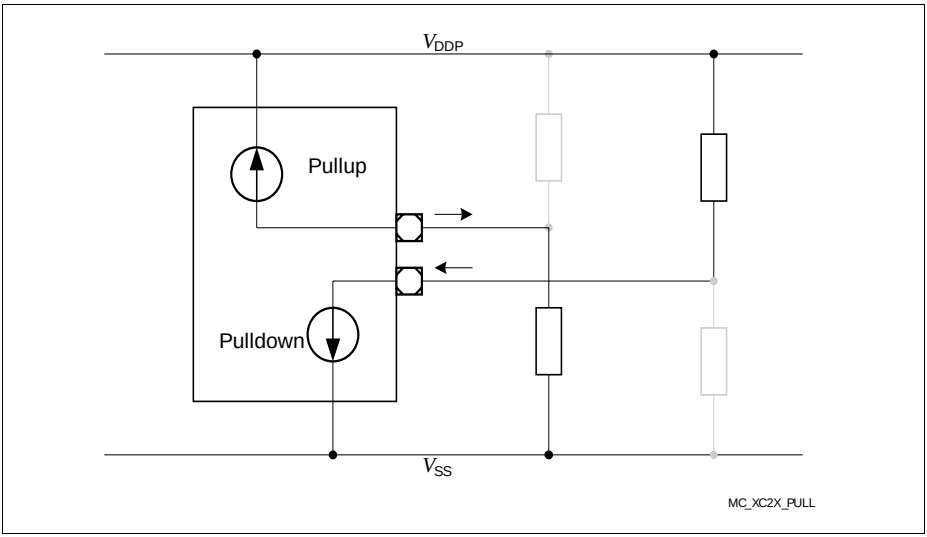

Figure 13 Pullup/Pulldown Current Definition

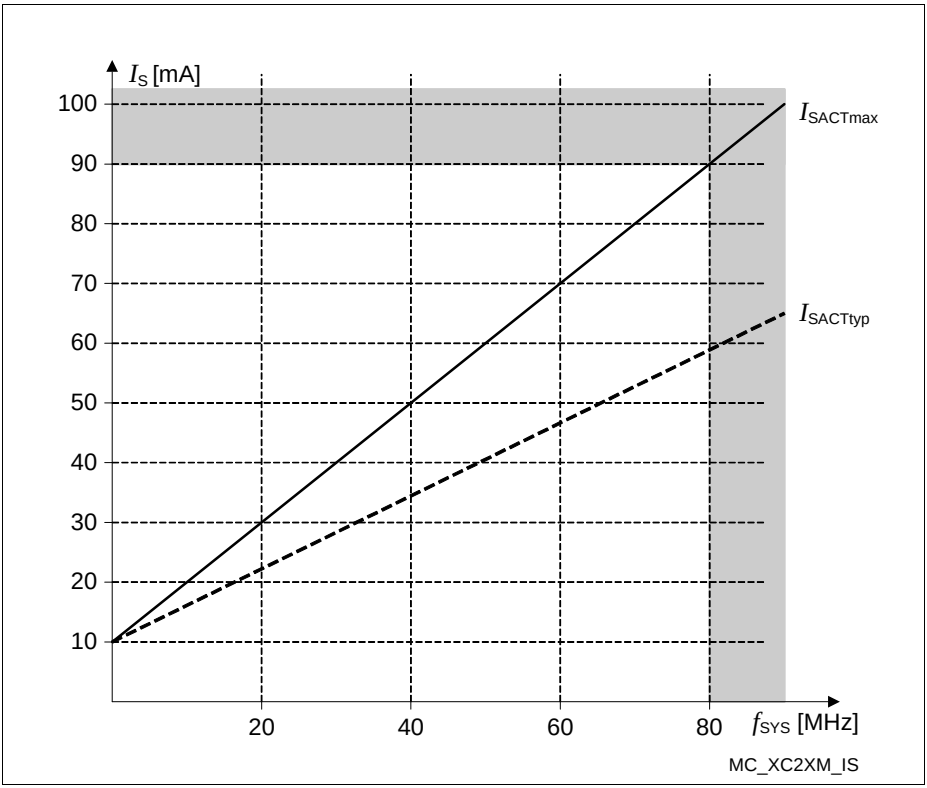

Figure 14 Supply Current in Active Mode as a Function of Frequency

Note: Operating Conditions apply.

Table 18 ADC Parameters (cont'd)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Broken wire detection delay against VAGND[2]	t_{BWG} CC	–	–	50	[3]	
Broken wire detection delay against VAREF[2]	t_{BWR} CC	–	–	50	[4]	
Conversion time for 8-bit result[2]	t_{c8} CC	(11 + STC) x t_{ADCI} + 2 x t_{SYS}				
Conversion time for 10-bit result[2]	t_{c10} CC	(13 + STC) x t_{ADCI} + 2 x t_{SYS}				
Total Unadjusted Error	|TUE| CC	–	1	2	LSB	[5]
Wakeup time from analog powerdown, fast mode[2]	t_{WAF} CC	–	–	4	µs	
Wakeup time from analog powerdown, slow mode[2]	t_{WAS} CC	–	–	15	µs	
Analog reference ground	V_{AGND} SR	V_{SS} - 0.05	–	1.5	V	
Analog input voltage range	V_{AIN} SR	V_{AGND}	–	V_{AREF}	V	[6]
Analog reference voltage	V_{AREF} SR	V_{AGND} + 1.0	–	V_{DDPA} + 0.05	V	[5]

1) These parameter values cover the complete operating range. Under relaxed operating conditions (room temperature, nominal supply voltage) the typical values can be used for calculation.

2) This parameter includes the sample time (also the additional sample time specified by STC), the time to determine the digital result and the time to load the result register with the conversion result. Values for the basic clock t_{ADCI} depend on programming.

3) The broken wire detection delay against V_{AGND} is measured in numbers of consecutive precharge cycles at a conversion rate of not more than 500 µs. Result below 10% (66_H).

4) The broken wire detection delay against V_{AREF} is measured in numbers of consecutive precharge cycles at a conversion rate of not more than 10 µs. This function is influenced by leakage current, in particular at high temperature. Result above 80% (332_H).

5) TUE is tested at V_{AREF} = V_{DDPA} = 5.0 V, V_{AGND} = 0 V. It is verified by design for all other voltages within the defined voltage range. The specified TUE is valid only if the absolute sum of input overload currents on analog port pins (see I_{OV} specification) does not exceed 10 mA, and if V_{AREF} and V_{AGND} remain stable during the measurement time.

6) V_{AIN} may exceed V_{AGND} or V_{AREF} up to the absolute maximum ratings. However, the conversion result in these cases will be $X000_H$ or $X3FF_H$, respectively.

Table 23 Flash Parameters (cont'd)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Number of erase cycles	N_{Er} SR	–	–	15 000	cycles	t_{RET} ≥ 5 years; Valid for up to 64 user-selected sectors (data storage)
		–	–	1 000	cycles	t_{RET} ≥ 20 years

1) All Flash module(s) can be erased/programmed while code is executed and/or data is read from only one Flash module or from PSRAM. The Flash module that delivers code/data can, of course, not be erased/programmed.
2) Flash module 3 can be erased/programmed while code is executed and/or data is read from any other Flash module.
3) Value of IMB_IMBCTRL.WSFLASH.
4) Programming and erase times depend on the internal Flash clock source. The control state machine needs a few system clock cycles. This increases the stated durations noticably only at extremely low system clock frequencies.

Access to the XC223xM Flash modules is controlled by the IMB. Built-in prefetch mechanisms optimize the performance for sequential access.

Flash access waitstates only affect non-sequential access. Due to prefetch mechanisms, the performance for sequential access (depending on the software structure) is only partially influenced by waitstates.

Table 27 is valid under the following conditions:
$V_{DDP} \geq 3.0$ V; $V_{DDPtyp} = 3.3$ V; $V_{DDP} \leq 4.5$ V; $C_L \geq 20$ pF; $C_L \leq 100$ pF;

Table 27 Standard Pad Parameters for Lower Voltage Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Maximum output driver current (absolute value)[1]	I_{Omax} CC	–	–	10	mA	Strong driver
		–	–	2.5	mA	Medium driver
		–	–	0.5	mA	Weak driver
Nominal output driver current (absolute value)	I_{Onom} CC	–	–	2.5	mA	Strong driver
		–	–	1.0	mA	Medium driver
		–	–	0.1	mA	Weak driver
Rise and Fall times (10% - 90%)	t_{RF} CC	–	–	6.2 + 0.24 x C_L	ns	Strong driver; Sharp edge
		–	–	24 + 0.3 x C_L	ns	Strong driver; Medium edge
		–	–	34 + 0.3 x C_L	ns	Strong driver; Slow edge
		–	–	37 + 0.65 x C_L	ns	Medium driver
		–	–	500 + 2.5 x C_L	ns	Weak driver

1) The total output current that may be drawn at a given time must be limited to protect the supply rails from damage. For any group of 16 neighboring output pins, the total output current in each direction (ΣI_{OL} and ΣI_{OH}) must remain below 50 mA.

Table 33 DAP Interface Timing for Lower Voltage Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
DAP0 clock period	t_{11} SR	25[1]	–	–	ns	
DAP0 high time	t_{12} SR	8	–	–	ns	
DAP0 low time	t_{13} SR	8	–	–	ns	
DAP0 clock rise time	t_{14} SR	–	–	4	ns	
DAP0 clock fall time	t_{15} SR	–	–	4	ns	
DAP1 setup to DAP0 rising edge	t_{16} SR	6	–	–	ns	pad_type= standard
DAP1 hold after DAP0 rising edge	t_{17} SR	6	–	–	ns	pad_type= standard
DAP1 valid per DAP0 clock period[2]	t_{19} CC	12	17	–	ns	pad_type= standard

1) The debug interface cannot operate faster than the overall system, therefore $t_{11} \geq t_{SYS}$.

2) The Host has to find a suitable sampling point by analyzing the sync telegram response.

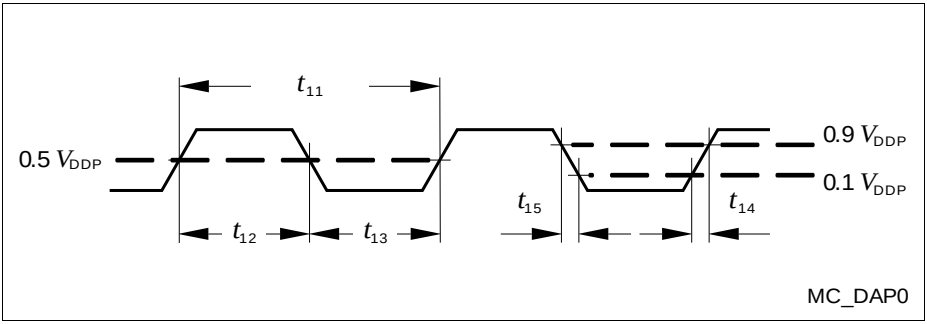

Figure 23 Test Clock Timing (DAP0)

Debug via JTAG

The following parameters are applicable for communication through the JTAG debug interface. The JTAG module is fully compliant with IEEE1149.1-2000.

Note: These parameters are not subject to production test but verified by design and/or characterization.

Note: Operating Conditions apply; C_L= 20 pF.

Table 34 JTAG Interface Timing for Upper Voltage Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
TCK clock period	t_1 SR	50[1]	–	–	ns	[2]
TCK high time	t_2 SR	16	–	–	ns	
TCK low time	t_3 SR	16	–	–	ns	
TCK clock rise time	t_4 SR	–	–	8	ns	
TCK clock fall time	t_5 SR	–	–	8	ns	
TDI/TMS setup to TCK rising edge	t_6 SR	6	–	–	ns	
TDI/TMS hold after TCK rising edge	t_7 SR	6	–	–	ns	
TDO valid from TCK falling edge (propagation delay)[3]	t_8 CC	–	25	29	ns	
TDO high impedance to valid output from TCK falling edge[4][3]	t_9 CC	–	25	29	ns	
TDO valid output to high impedance from TCK falling edge[3]	t_{10} CC	–	25	29	ns	
TDO hold after TCK falling edge[3]	t_{18} CC	5	–	–	ns	

1) The debug interface cannot operate faster than the overall system, therefore $t_1 \geq t_{SYS}$.

2) Under typical conditions, the interface can operate at transfer rates up to 20 MHz.

3) The falling edge on TCK is used to generate the TDO timing.

4) The setup time for TDO is given implicitly by the TCK cycle time.

Package Outlines

5.2 Thermal Considerations

When operating the XC223xM in a system, the total heat generated in the chip must be dissipated to the ambient environment to prevent overheating and the resulting thermal damage.

The maximum heat that can be dissipated depends on the package and its integration into the target board. The “Thermal resistance $R_{\Theta JA}$” quantifies these parameters. The power dissipation must be limited so that the average junction temperature does not exceed 125 °C.

The difference between junction temperature and ambient temperature is determined by
$\Delta T = (P_{INT} + P_{IOSTAT} + P_{IODYN}) \times R_{\Theta JA}$

The internal power consumption is defined as
$P_{INT} = V_{DDP} \times I_{DDP}$ (switching current and leakage current).

The static external power consumption caused by the output drivers is defined as
$P_{IOSTAT} = \Sigma((V_{DDP}-V_{OH}) \times I_{OH}) + \Sigma(V_{OL} \times I_{OL})$

The dynamic external power consumption caused by the output drivers (P_{IODYN}) depends on the capacitive load connected to the respective pins and their switching frequencies.

If the total power dissipation for a given system configuration exceeds the defined limit, countermeasures must be taken to ensure proper system operation:

- Reduce V_{DDP}, if possible in the system
- Reduce the system frequency
- Reduce the number of output pins
- Reduce the load on active output drivers
