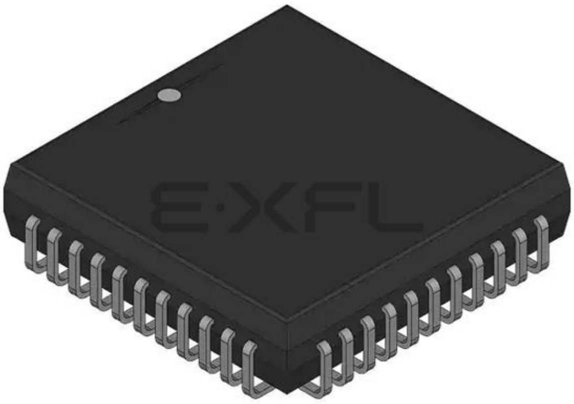
Atmel - ATF1504ASVL-20JU44 Datasheet



Welcome to E-XFL.COM

Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Active
Programmable Type	In System Programmable (min 10K program/erase cycles)
Delay Time tpd(1) Max	20 ns
Voltage Supply - Internal	3V ~ 3.6V
Number of Logic Elements/Blocks	-
Number of Macrocells	64
Number of Gates	-
Number of I/O	32
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LCC (J-Lead)
Supplier Device Package	44-PLCC (16.6x16.6)
Purchase URL	https://www.e-xfl.com/product-detail/atmel/atf1504asvl-20ju44

Description

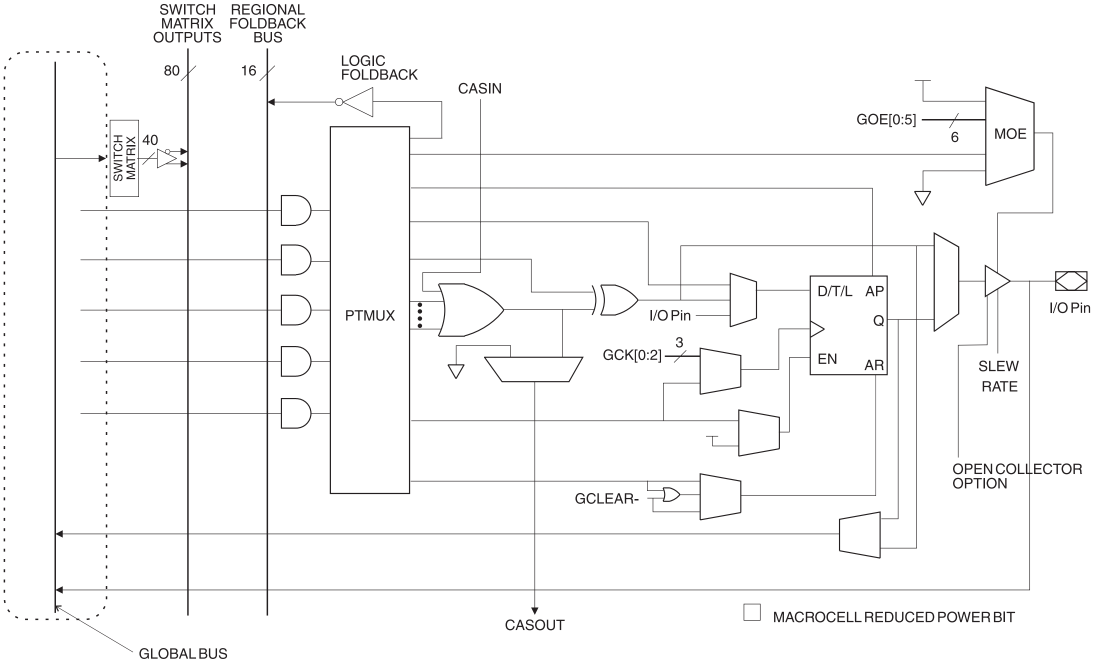
The ATF1504ASV(L) is a high-performance, high-density complex programmable logic device (CPLD) that utilizes Atmel's proven electrically-erasable memory technology. With 64 logic macrocells and up to 68 inputs, it easily integrates logic from several TTL, SSI, MSI, LSI and classic PLDs. The ATF1504ASV(L)'s enhanced routing switch matrices increase usable gate count and the odds of successful pin-locked design modifications.

The ATF1504ASV(L) has up to 68 bi-directional I/O pins and four dedicated input pins, depending on the type of device package selected. Each dedicated pin can also serve as a global control signal, register clock, register reset or output enable. Each of these control signals can be selected for use individually within each macrocell.

Each of the 64 macrocells generates a buried feedback that goes to the global bus. Each input and I/O pin also feeds into the global bus. The switch matrix in each logic block then selects 40 individual signals from the global bus. Each macrocell also generates a foldback logic term that goes to a regional bus. Cascade logic between macrocells in the ATF1504ASV(L) allows fast, efficient generation of complex logic functions. The ATF1504ASV(L) contains four such logic chains, each capable of creating sum term logic with a fan-in of up to 40 product terms.

The ATF1504ASV(L) macrocell, shown in Figure 1, is flexible enough to support highly-complex logic functions operating at high speed. The macrocell consists of five sections: product terms and product term select multiplexer, OR/XOR/CASCADE logic, a flip-flop, output select and enable, and logic array inputs.

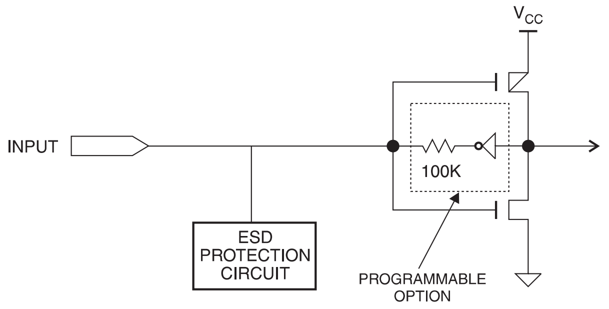
Figure 1. ATF1504ASV(L) Macrocell



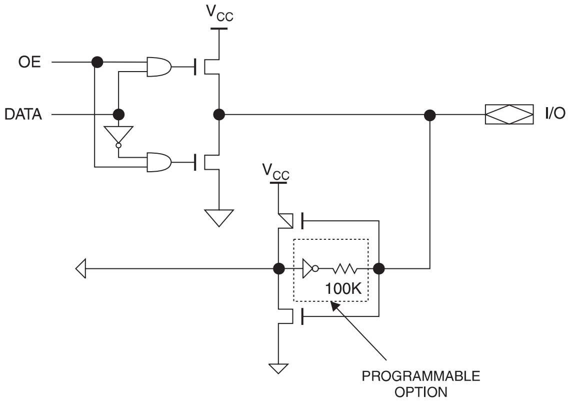
Programmable Pin-keeper Option for Inputs and I/Os

The ATF1504ASV(L) offers the option of programming all input and I/O pins so that pin keeper circuits can be utilized. When any pin is driven high or low and then subsequently left floating, it will stay at that previous high- or low-level. This circuitry prevents unused input and I/O lines from floating to intermediate voltage levels, which causes unnecessary power consumption and system noise. The keeper circuits eliminate the need for external pull-up resistors and eliminate their DC power consumption.

Input Diagram



I/O Diagram



Speed/Power Management

The ATF1504ASV(L) has several built-in speed and power management features. The ATF1504ASV(L) contains circuitry that automatically puts the device into a low power standby mode when no logic transitions are occurring. This not only reduces power consumption during inactive periods, but also provides proportional power savings for most applications running at system speeds below 5 MHz. This feature may be selected as a device option.

To further reduce power, each ATF1504ASV(L) macrocell has a reduced-power bit feature. This feature allows individual macrocells to be configured for maximum power savings. This feature may be selected as a design option.

All ATF1504ASV(L) also have an optional power-down mode. In this mode, current drops to below 5 mA. When the power-down option is selected, either PD1 or PD2 pins (or both) can be used to power down the part. The power-down option is selected in the design source file. When enabled, the device goes into power down when either PD1 or PD2 is high. In the power-down mode, all internal logic signals are latched and held, as are any enabled outputs.

All pin transitions are ignored until the PD pin is brought low. When the power-down feature is enabled, the PD1 or PD2 pin cannot be used as a logic input or output. However, the pin's macrocell may still be used to generate buried foldback and cascade logic signals.

All power-down AC characteristic parameters are computed from external input or I/O pins, with reduced-power bit turned on. For macrocells in reduced-power mode (reduced-power bit turned on), the reduced-power adder, t_{RPA}, must be added to the AC parameters, which include the data paths t_{LAD}, t_{LAC}, t_{IC}, t_{ACL}, t_{ACH} and t_{SEXP}.

The ATF1504ASV(L) macrocell also has an option whereby the power can be reduced on a per macrocell basis. By enabling this power-down option, macrocells that are not used in an application can be turned down, thereby reducing the overall power consumption of the device.

Each output also has individual slew rate control. This may be used to reduce system noise by slowing down outputs that do not need to operate at maximum speed. Outputs default to slow switching, and may be specified as fast switching in the design file.

Design Software Support

ATF1504ASV(L) designs are supported by several industry standard third party tools. Automated fitters allow logic synthesis using a variety of high-level description languages and formats.

Power-up Reset

The ATF1504ASV is designed with a power-up reset, a feature critical for state machine initialization. At a point delayed slightly from V_{CC} crossing V_{RST}, all registers will be initialized, and the state of each output will depend on the polarity of its buffer. However, due to the asynchronous nature of reset and uncertainty of how V_{CC} actually rises in the system, the following conditions are required:

1. The V_{CC} rise must be monotonic,
2. After reset occurs, all input and feedback setup times must be met before driving the clock pin high, and,
3. The clock must remain stable during T_D.

The ATF1504ASV has two options for the hysteresis about the reset level, V_{RST}, Small and Large. To ensure a robust operating environment in applications where the device is operated near 3.0V, Atmel recommends that during the fitting process users configure the device with the Power-up Reset hysteresis set to Large. For conversions, Atmel POF2JED users should include the flag "-power_reset" on the command line after "filename.POF". To allow the registers to be properly reinitialized with the Large hysteresis option selected, the following condition is added:

4. If V_{CC} falls below 2.0V, it must shut off completely before the device is turned on again.

When the Large hysteresis option is active, I_{CC} is reduced by several hundred microamps as well.

Security Fuse Usage

A single fuse is provided to prevent unauthorized copying of the ATF1504ASV(L) fuse patterns. Once programmed, fuse verify is inhibited. However, the 16-bit User Signature remains accessible.

Programming

ATF1504ASV(L) devices are in-system programmable (ISP) devices utilizing the 4-pin JTAG protocol. This capability eliminates package handling normally required for programming and facilitates rapid design iterations and field changes.

Atmel provides ISP hardware and software to allow programming of the ATF1504ASV(L) via the PC. ISP is performed by using either a download cable, a comparable board tester or a simple microprocessor interface.

To facilitate ISP programming by the Automated Test Equipment (ATE) vendors. Serial Vector Format (SVF) files can be created by Atmel provided software utilities.

ATF1504ASV(L) devices can also be programmed using standard third-party programmers. With third-party programmer the JTAG ISP port can be disabled thereby allowing four additional I/O pins to be used for logic.

Contact your local Atmel representatives or Atmel PLD applications for details.

ISP Programming Protection

The ATF1504ASV(L) has a special feature that locks the device and prevents the inputs and I/O from driving if the programming process is interrupted for any reason. The inputs and I/O default to high-Z state during such a condition. In addition the pin keeper option preserves the former state during device programming, if this circuit were previously programmed on the device. This prevents disturbing the operation of other circuits in the system while the ATF1504ASV(L) is being programmed via ISP.

All ATF1504ASV(L) devices are initially shipped in the erased state thereby making them ready to use for ISP.

Note: For more information refer to the “Designing for In-System Programmability with Atmel CPLDs” application note.

DC and AC Operating Conditions

	Commercial	Industrial
Operating Temperature (Ambient))	0°C - 70°C	-40°C - 85°C
V_{CC} (3.3V) Power Supply	3.0V - 3.6V	3.0V - 3.6V

DC Characteristics

Symbol	Parameter	Condition			Min	Typ	Max	Units
I_{IL}	Input or I/O Low Leakage Current	$V_{IN} = V_{CC}$				-2	-10	μA
I_{IH}	Input or I/O High Leakage Current					2	10	
I_{OZ}	Tri-State Output Off-State Current	$V_O = V_{CC}$ or GND			-40		40	μA
I_{CC1}	Power Supply Current, Standby	V_{CC} = Max V_{IN} = 0, V_{CC}	Std Mode	Com.		60		mA
				Ind.		75		mA
			“L” Mode	Com.		5		μA
				Ind.		5		μA
I_{CC2}	Power Supply Current, Power-down Mode	V_{CC} = Max V_{IN} = 0, V_{CC}	“PD” Mode			0.1	5	mA
I_{CC3}[2]	Reduced-power Mode Supply Current, Standby	V_{CC} = Max V_{IN} = 0, V_{CC}	Std Power	Com		40		ma
				Ind		55		
V_{IL}	Input Low Voltage				-0.3		0.8	V
V_{IH}	Input High Voltage				1.7		V_{CCIO} + 0.3	V
V_{OL}	Output Low Voltage (TTL)	$V_{IN} = V_{IH}$ or V_{IL} V_{CCIO} = Min, I_{OL} = 8 mA		Com.			0.45	V
				Ind.			0.45	
	Output Low Voltage (CMOS)	$V_{IN} = V_{IH}$ or V_{IL} V_{CC} = Min, I_{OL} = 0.1 mA		Com.			0.2	V
				Ind.			0.2	V
V_{OH}	Output High Voltage - 3.3V (TTL)	$V_{IN} = V_{IH}$ or V_{IL} V_{CCIO} = Min, I_{OH} = -2.0 mA			2.4			V
	Output High Voltage - 3.3V (CMOS)	$V_{IN} = V_{IH}$ or V_{IL} V_{CCIO} = Min, I_{OH} = -0.1 mA			V_{CCIO} - 0.2			V

Notes: 1. Not more than one output at a time should be shorted. Duration of short circuit test should not exceed 30 sec.
2. When microcell reduced-power feature is enabled.

Pin Capacitance

	Typ	Max	Units	Conditions
C_{IN}		8	pF	V_{IN} = 0V; f = 1.0 MHz
$C_{I/O}$		8	pF	V_{OUT} = 0V; f = 1.0 MHz

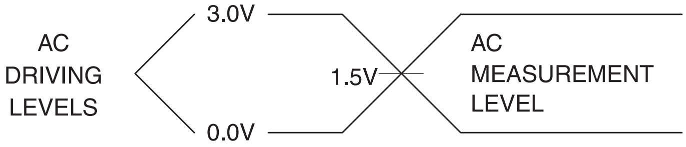
Note: Typical values for nominal supply voltage. This parameter is only sampled and is not 100% tested.
The OGI pin (high-voltage pin during programming) has a maximum capacitance of 12 pF.

AC Characteristics (Continued)

Symbol	Parameter	-15		-20		Units
		Min	Max	Min	Max	
t_{ZX2}	Output Buffer Enable Delay (Slow slew rate = OFF; V_{CCIO} = 3.3V; C_L = 35 pF)		7		9	ns
t_{ZX3}	Output Buffer Enable Delay (Slow slew rate = ON; V_{CCIO} = 5.0V/3.3V; C_L = 35 pF)		10		11	ns
t_{XZ}	Output Buffer Disable Delay (C_L = 5 pF)		6		7	ns
t_{SU}	Register Setup Time	5		6		ns
t_H	Register Hold Time	4		5		ns
t_{FSU}	Register Setup Time of Fast Input	2		2		ns
t_{FH}	Register Hold Time of Fast Input	2		2		ns
t_{RD}	Register Delay		2		2.5	ns
t_{COMB}	Combinatorial Delay		2		3	ns
t_{IC}	Array Clock Delay		6		7	ns
t_{EN}	Register Enable Time		6		7	ns
t_{GLOB}	Global Control Delay		2		3	ns
t_{PRE}	Register Preset Time		4		5	ns
t_{CLR}	Register Clear Time		4		5	ns
t_{UIM}	Switch Matrix Delay		2		2.5	ns
t_{RPA}	Reduced-power Adder[2]		10		13	ns

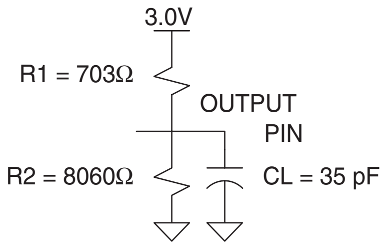
Notes:
1. See ordering information for valid part numbers.
2. The t_{RPA} parameter must be added to the t_{LAD}, t_{LAC}, t_{TIC}, t_{ACL}, and t_{SEXP} parameters for macrocells running in the reduced-power mode.
3. See ordering information for valid part numbers.

Input Test Waveforms and Measurement Levels



t_R, t_F = 1.5 ns typical

Output AC Test Loads



Power-down Mode

The ATF1504ASV(L) includes an optional pin-controlled power-down feature. When this mode is enabled, the PD pin acts as the power-down pin. When the PD pin is high, the device supply current is reduced to less than 3 mA. During power down, all output data and internal logic states are latched internally and held. Therefore, all registered and combinatorial output data remain valid. Any outputs that were in a High-Z state at the onset will remain at High-Z. During power down, all input signals except the power-down pin are blocked. Input and I/O hold latches remain active to ensure that pins do not float to indeterminate levels, further reducing system power. The power-down mode feature is enabled in the logic design file or as a fitted or translated s/w option. Designs using the power-down pin may not use the PD pin as a logic array input. However, all other PD pin macrocell resources may still be used, including the buried feedback and foldback product term array inputs.

Power Down AC Characteristics(1)(2)

Symbol	Parameter	-15		-20		Units
		Min	Max	Min	Max	
t_{IVDH}	Valid I, I/O before PD High	15		20		ns
t_{GVDH}	Valid OE(2) before PD High	15		20		ns
t_{CVDH}	Valid Clock(2) before PD High	15		20		ns
t_{DHIX}	I, I/O Don't Care after PD High		25		30	ns
t_{DHGX}	OE(2) Don't Care after PD High		25		30	ns
t_{DHCX}	Clock(2) Don't Care after PD High		25		30	ns
t_{DLIV}	PD Low to Valid I, I/O		1		1	µs
t_{DLGV}	PD Low to Valid OE (Pin or Term)		1		1	µs
t_{DLCV}	PD Low to Valid Clock (Pin or Term)		1		1	µs
t_{DLOV}	PD Low to Valid Output		1		1	µs

Notes:
1. For slow slew outputs, add t_{SSO}.
2. Pin or product term.
3. Includes t_{RPA} for reduced-power bit enabled.

Note:
1. The last time buy is Sept. 30, 2005 for shaded parts.
2. The recommended migration for QC100 or JC68 packages is the AU100 or the smaller JU44 packages.
3. The recommended migration for the JC84 package is the ATF1508ASV-15JU84

Using "C" Product for Industrial

There is very little risk in using "C" devices for industrial applications because the V_{CC} conditions for 3.3V products are the same for commercial and industrial (there is only 15°C difference at the high end of the temperature range). To use commercial product for industrial temperature ranges, de-rate I_{CC} by 15%.
