#### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Note 1. Supply current values are with all output pins unloaded and all input pull-up MOSs in the off state.

Note 2. Supply of the clock signal to peripheral modules is stopped in this state. This does not include operations as BGO (background operations).

Note 3.  $I_{CC}$  depends on  $f$  ( $I_{CLK}$ ) as follows. ( $I_{CLK}:P_{CLKA}:P_{CLKB}/P_{CLKC}/P_{CLKD}:B_{CLK}:B_{CLK} \text{ pin} = 10:5:2.5:5:2.5$  when  $EXTAL = 24 \text{ MHz}$ )

$$I_{CC} \text{ Max.} = 0.47 \times f + 107 \text{ (max. operation in high-speed operating mode)}$$

$$I_{CC} \text{ Typ.} = 0.09 \times f + 7 \text{ (normal operation in high-speed operating mode)}$$

$$I_{CC} \text{ Max.} = 0.50 \times f + 4 \text{ (sleep mode)}$$

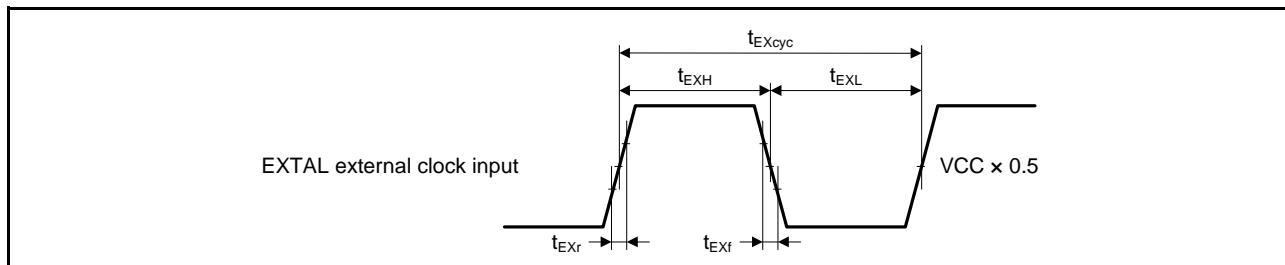

Note 4. This does not include operations as BGO (background operations). Whether supply of the clock signal to peripheral modules continues or is stopped only depends on the state determined by the settings of the bits in module stop control registers A to D. The setting for the peripheral module clock stopped state is  $F_{CLK} = B_{CLK} = P_{CLKA} = P_{CLKB} = P_{CLKC} = P_{CLKD} = B_{CLK} \text{ pin} = 3.75 \text{ MHz}$  (division by 64).

Note 2. When several oscillators were running before the transition to software standby, the greatest value of the oscillation stabilization waiting time t<sub>SBYOSCWT</sub> is selected.

Note 3. For n, the greatest value is selected from among the internal clock division settings.

Note 4. This condition applies when f<sub>ICLK</sub>:f<sub>FCLK</sub> = 1:1, 2:1, or 4:1.

Note 1. t<sub>PAcyc</sub>: PCLKA cycle

Note 2. We recommend using pins that have a letter ("A", "-B", etc.) to indicate group membership appended to their names as groups.  
 For the RSPI interface, the AC portion of the electrical characteristics is measured for each group.
