

Welcome to [E-XFL.COM](#)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

|                            |                                                                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Status             | Active                                                                                                                                                                          |
| Core Processor             | RXv2                                                                                                                                                                            |
| Core Size                  | 32-Bit Single-Core                                                                                                                                                              |
| Speed                      | 240MHz                                                                                                                                                                          |
| Connectivity               | CANbus, EBI/EMI, Ethernet, I <sup>2</sup> C, MMC/SD, QSPI, SCI, SPI, SSI, USB OTG                                                                                               |
| Peripherals                | DMA, LVD, POR, PWM, WDT                                                                                                                                                         |
| Number of I/O              | 127                                                                                                                                                                             |
| Program Memory Size        | 4MB (4M x 8)                                                                                                                                                                    |
| Program Memory Type        | FLASH                                                                                                                                                                           |
| EEPROM Size                | 64K x 8                                                                                                                                                                         |
| RAM Size                   | 512K x 8                                                                                                                                                                        |
| Voltage - Supply (Vcc/Vdd) | 2.7V ~ 3.6V                                                                                                                                                                     |
| Data Converters            | A/D 8x12b, 21x12b; D/A 2x12                                                                                                                                                     |
| Oscillator Type            | Internal                                                                                                                                                                        |
| Operating Temperature      | -40°C ~ 85°C (TA)                                                                                                                                                               |
| Mounting Type              | Surface Mount                                                                                                                                                                   |
| Package / Case             | 177-TFLGA                                                                                                                                                                       |
| Supplier Device Package    | 177-TFLGA (8x8)                                                                                                                                                                 |

**Table 1.4 Pin Functions (5/8)**

| Classifications     | Pin Name                                          | I/O    | Description                                                                                                                   |
|---------------------|---------------------------------------------------|--------|-------------------------------------------------------------------------------------------------------------------------------|
| Ethernet controller | REF50CK0, REF50CK1                                | Input  | 50-MHz reference clocks. These pins input reference signals for transmission/reception timings in RMII mode.                  |
|                     | RMII0_CRS_DV,<br>RMII1_CRS_DV                     | Input  | Indicate that there are carrier detection signals and valid receive data on RMII_RXD1 and RMII_RXD0 in RMII mode.             |
|                     | RMII0_TXD0, RMII0_TXD1,<br>RMII1_TXD0, RMII1_TXD1 | Output | 2-bit transmit data in RMII mode                                                                                              |
|                     | RMII0_RXD0, RMII0_RXD1,<br>RMII1_RXD0, RMII1_RXD1 | Input  | 2-bit receive data in RMII mode                                                                                               |
|                     | RMII0_TXD_EN,<br>RMII1_TXD_EN                     | Output | Output pins for data transmit enable signals in RMII mode                                                                     |
|                     | RMII0_RX_ER,<br>RMII1_RX_ER                       | Input  | Indicate an error has occurred during reception of data in RMII mode.                                                         |
|                     | ET0_CRS,<br>ET1_CRS                               | Input  | Carrier detection/data reception enable pins                                                                                  |
|                     | ET0_RX_DV,<br>ET1_RX_DV                           | Input  | Indicate that there are valid receive data on ET_ERXD3 to ET_ERXD0.                                                           |
|                     | ET0_EXOUT,<br>ET1_EXOUT                           | Output | General-purpose external output pins                                                                                          |
|                     | ET0_LINKSTA<br>ET1_LINKSTA                        | Input  | Input link status from the PHY-LSI.                                                                                           |
|                     | ET0_ETXD0 to ET0_ETXD3,<br>ET1_ETXD0 to ET1_ETXD3 | Output | 4 bits of MII transmit data                                                                                                   |
|                     | ET0_ERXD0 to ET0_ERXD3,<br>ET1_ERXD0 to ET1_ERXD3 | Input  | 4 bits of MII receive data                                                                                                    |
|                     | ET0_TX_EN,<br>ET1_TX_EN                           | Output | Transmit enable pins. Function as signals indicating that transmit data is ready on ET_ETXD3 to ET_ETXD0.                     |
|                     | ET0_TX_ER,<br>ET1_TX_ER                           | Output | Transmit error pins. Function as signals notifying the PHY-LSI of an error during transmission.                               |
|                     | ET0_RX_ER,<br>ET1_RX_ER                           | Input  | Receive error pins. Function as signals to recognize an error during reception.                                               |
|                     | ET0_TX_CLK,<br>ET1_TX_CLK                         | Input  | Transmit clock pins. These pins input reference signals for output timings from ET_TX_EN, ET_ETXD3 to ET_ETXD0, and ET_TX_ER. |
|                     | ET0_RX_CLK,<br>ET1_RX_CLK                         | Input  | Receive clock pins. These pins input reference signals for input timings to ET_RX_DV, ET_ERXD3 to ET_ERXD0, and ET_RX_ER.     |
|                     | ET0_COL, ET1_COL                                  | Input  | Input collision detection signals.                                                                                            |
|                     | ET0_WOL, ET1_WOL                                  | Output | Receive Magic packets.                                                                                                        |
|                     | ET0_MDC, ET1_MDC                                  | Output | Output reference clock signals for information transfer via ET_MDIO.                                                          |
|                     | ET0_MDIO, ET1_MDIO                                | I/O    | Input or output bidirectional signals for exchange of management information between this MCU and the PHY-LSI.                |

**Table 1.4 Pin Functions (8/8)**

| Classifications | Pin Name             | I/O | Description                                                       |
|-----------------|----------------------|-----|-------------------------------------------------------------------|
| I/O ports       | P00 to P03, P05, P07 | I/O | 6-bit input/output pins                                           |
|                 | P10 to P17           | I/O | 8-bit input/output pins                                           |
|                 | P20 to P27           | I/O | 8-bit input/output pins                                           |
|                 | P30 to P37           | I/O | 8-bit input/output pins (P35: input pin)                          |
|                 | P40 to P47           | I/O | 8-bit input/output pins                                           |
|                 | P50 to P56           | I/O | 7-bit input/output pins<br>(176-pin devices have only P50 to P53) |
|                 | P60 to P67           | I/O | 8-bit input/output pins                                           |
|                 | P70 to P77           | I/O | 8-bit input/output pins                                           |
|                 | P80 to P83, P86, P87 | I/O | 6-bit input/output pins                                           |
|                 | P90 to P97           | I/O | 8-bit input/output pins                                           |
|                 | PA0 to PA7           | I/O | 8-bit input/output pins                                           |

Note: Note the following regarding pin names. For details, see section 1.5, Pin Assignments.

- We recommend using pins that have a letter ("A", "B", etc.) to indicate group membership appended to their names as groups. For the RSPI, QSPI, SDHI, and MMC interfaces, the AC portion of the electrical characteristics is measured for each group.
- Pins that have "-DS" appended to their names can be used as triggers for release from deep software standby.
- IIC pin functions that have [FM+] appended to their names support fast-mode plus.

Note 1. The time for return after release from software standby is determined by the value obtained by adding the oscillation stabilization waiting time ( $t_{SBYOSCWT}$ ) and the time required for operations by the software standby release sequencer ( $t_{SBYSEQ}$ ).

Note 2. When several oscillators were running before the transition to software standby, the greatest value of the oscillation stabilization waiting time  $t_{SBYOSCWT}$  is selected.

Note 3. For n, the greatest value is selected from among the internal clock division settings.

Note 4. This condition applies when  $f_{ICLK}:f_{FCLK} = 1:1$ ,  $2:1$ , or  $4:1$ .

Note 1. Address pins for output of the precharge-setting command (Precharge-sel) for SDRAM.

Note 1. Definition of reprogram/erase cycle:

The reprogram/erase cycle is the number of erasing for each block. When the reprogram/erase cycle is n times ( $n = 1000$ ), erasing can be performed n times for each block. For instance, when 256-byte programming is performed 32 times for different addresses in 8-Kbyte block and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address for several times as one erasing is not enabled (overwriting is prohibited).

Note 2. This is the minimum number of times to guarantee all the characteristics after reprogramming (guaranteed range is from 1 to the value of the minimum value).

Note 3. This shows the characteristics when reprogramming is performed within the specified range, including the minimum value.
