
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, LCD, POR, PWM, WDT
Number of I/O	85
Program Memory Size	64KB (22K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	8K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	A/D 24x10/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	121-TFBGA
Supplier Device Package	121-TFBGA (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fj64ga310-i-bg

- 1 = The contents of the DMA buffer have not been written to the location specified in DMADSTx or DMASRCx in Null Write mode
- 0 = The contents of the DMA buffer have been written to the location specified in DMADSTx or DMASRCx in Null Write mode

bit 14 **Unimplemented:** Read as '0'

bit 13-8 **CHSEL<5:0>:** DMA Channel Trigger Selection bits

See Table 5-1 for a complete list.

bit 7 **HIGHIF:** DMA High Address Limit Interrupt Flag bit(1,2)
- 1 = The DMA channel has attempted to access an address higher than DMAH or the upper limit of the data RAM space
- 0 = The DMA channel has not invoked the high address limit interrupt

bit 6 **LOWIF:** DMA Low Address Limit Interrupt Flag bit(1,2)
- 1 = The DMA channel has attempted to access the DMA SFR address lower than DMAL, but above the SFR range (07FFh)
- 0 = The DMA channel has not invoked the low address limit interrupt

bit 5 **DONEIF:** DMA Complete Operation Interrupt Flag bit(1)

If CHEN = 1:
- 1 = The previous DMA session has ended with completion
- 0 = The current DMA session has not yet completed

If CHEN = 0:
- 1 = The previous DMA session has ended with completion
- 0 = The previous DMA session has ended without completion

bit 4 **HALFIF:** DMA 50% Watermark Level Interrupt Flag bit(1)
- 1 = DMACNTx has reached the halfway point to 0000h
- 0 = DMACNTx has not reached the halfway point

bit 3 **OVRUNIF:** DMA Channel Overrun Flag bit(1)
- 1 = The DMA channel is triggered while it is still completing the operation based on the previous trigger
- 0 = The overrun condition has not occurred

bit 2-1 **Unimplemented:** Read as '0'

bit 0 **HALFEN:** Halfway Completion Watermark bit
- 1 = Interrupts are invoked when DMACNTx has reached its halfway point and is at completion
- 0 = An interrupt is invoked only at the completion of the transfer

Note 1: Setting these flags in software does not generate an interrupt.

2: Testing for address limit violations (DMASRCx or DMADSTx is either greater than DMAH or less than DMAL) is NOT done before the actual access.

11 = 1:256
10 = 1:64
01 = 1:8
00 = 1:1

bit 3 **T32:** 32-Bit Timer Mode Select bit(1)
1 = Timerx and Timery form a single 32-bit timer
0 = Timerx and Timery act as two 16-bit timers
In 32-bit mode, T3CON control bits do not affect 32-bit timer operation.

bit 2 **Unimplemented:** Read as '0'

bit 1 **TCS:** Timerx Clock Source Select bit(2)
1 = External clock is from pin, TxCK (on the rising edge)
0 = Internal clock (FOSC/2)

bit 0 **Unimplemented:** Read as '0'

Note 1: In T4CON, the T45 bit is implemented instead of T32 to select 32-bit mode. In 32-bit mode, the T3CON or T5CON control bits do not affect 32-bit timer operation.

2: If TCS = 1, RPINRx (TxCK) must be configured to an available RPn/RPIn pin. For more information, see **Section 11.4 "Peripheral Pin Select (PPS)"**.

3: Changing the value of TxCON while the timer is running (TON = 1) causes the timer prescale counter to reset and is not recommended.

14.0 INPUT CAPTURE WITH DEDICATED TIMERS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to **"Input Capture with Dedicated Timer"** (DS39722) in the *"dsPIC33/PIC24 Family Reference Manual"*. The information in this data sheet supersedes the information in the FRM.

Devices in the PIC24FJ128GA310 family contain seven independent input capture modules. Each of the modules offers a wide range of configuration and operating options for capturing external pulse events and generating interrupts.

Key features of the input capture module include:

- Hardware-configurable for 32-bit operation in all modes by cascading two adjacent modules
- Synchronous and Trigger modes of output compare operation, with up to 30 user-selectable sync/trigger sources available
- A 4-level FIFO buffer for capturing and holding timer values for several events
- Configurable interrupt generation
- Up to 6 clock sources available for each module, driving a separate internal 16-bit counter

The module is controlled through two registers: ICxCON1 (Register 14-1) and ICxCON2 (Register 14-2). A general block diagram of the module is shown in Figure 14-1.

14.1 General Operating Modes

14.1.1 SYNCHRONOUS AND TRIGGER MODES

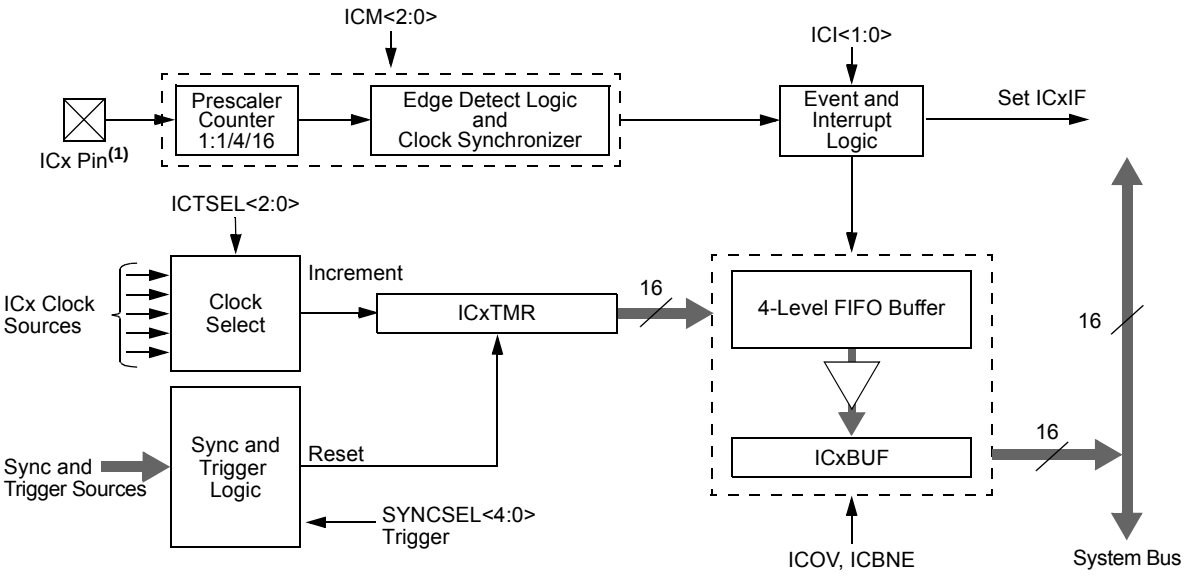
When the input capture module operates in a Free-Running mode, the internal 16-bit counter, ICxTMR, counts up continuously, wrapping around from FFFFh to 0000h on each overflow. Its period is synchronized to the selected external clock source. When a capture event occurs, the current 16-bit value of the internal counter is written to the FIFO buffer.

In Synchronous mode, the module begins capturing events on the ICx pin as soon as its selected clock source is enabled. Whenever an event occurs on the selected sync source, the internal counter is reset. In Trigger mode, the module waits for a Sync event from another internal module to occur before allowing the internal counter to run.

Standard, free-running operation is selected by setting the SYNCSELx bits (ICxCON2<4:0>) to '00000' and clearing the ICTRIG bit (ICxCON2<7>). Synchronous and Trigger modes are selected any time the SYNCSELx bits are set to any value except '00000'. The ICTRIG bit selects either Synchronous or Trigger mode; setting the bit selects Trigger mode operation. In both modes, the SYNCSELx bits determine the sync/trigger source.

When the SYNCSELx bits are set to '00000' and ICTRIG is set, the module operates in Software Trigger mode. In this case, capture operations are started by manually setting the TRIGSTAT bit (ICxCON2<6>).

FIGURE 14-1: INPUT CAPTURE x BLOCK DIAGRAM



Note 1: The ICx inputs must be assigned to an available RPn/RPIn pin before use. See **Section 11.4 "Peripheral Pin Select (PPS)"** for more information.

2: Never use an IC module as its own trigger source, by selecting this mode.

NOTES:

16.0 SERIAL PERIPHERAL INTERFACE (SPI)

Note:	This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to **"Serial Peripheral Interface (SPI)"** (DS39699) in the *"dsPIC33/PIC24 Family Reference Manual"*. The information in this data sheet supersedes the information in the FRM.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, shift registers, display drivers, ADC Converters, etc. The SPI module is compatible with the SPI and SIOP Motorola® interfaces. All PIC24FJ128GA310 family devices include two SPI modules.

The module supports operation in two buffer modes. In Standard mode, data is shifted through a single serial buffer. In Enhanced Buffer mode, data is shifted through an 8-level FIFO buffer.

Note:	Do not perform Read-Modify-Write operations (such as bit-oriented instructions) on the SPIxBUF register in either Standard or Enhanced Buffer mode.

The module also supports a basic framed SPI protocol while operating in either Master or Slave mode. A total of four framed SPI configurations are supported.

The SPI serial interface consists of four pins:

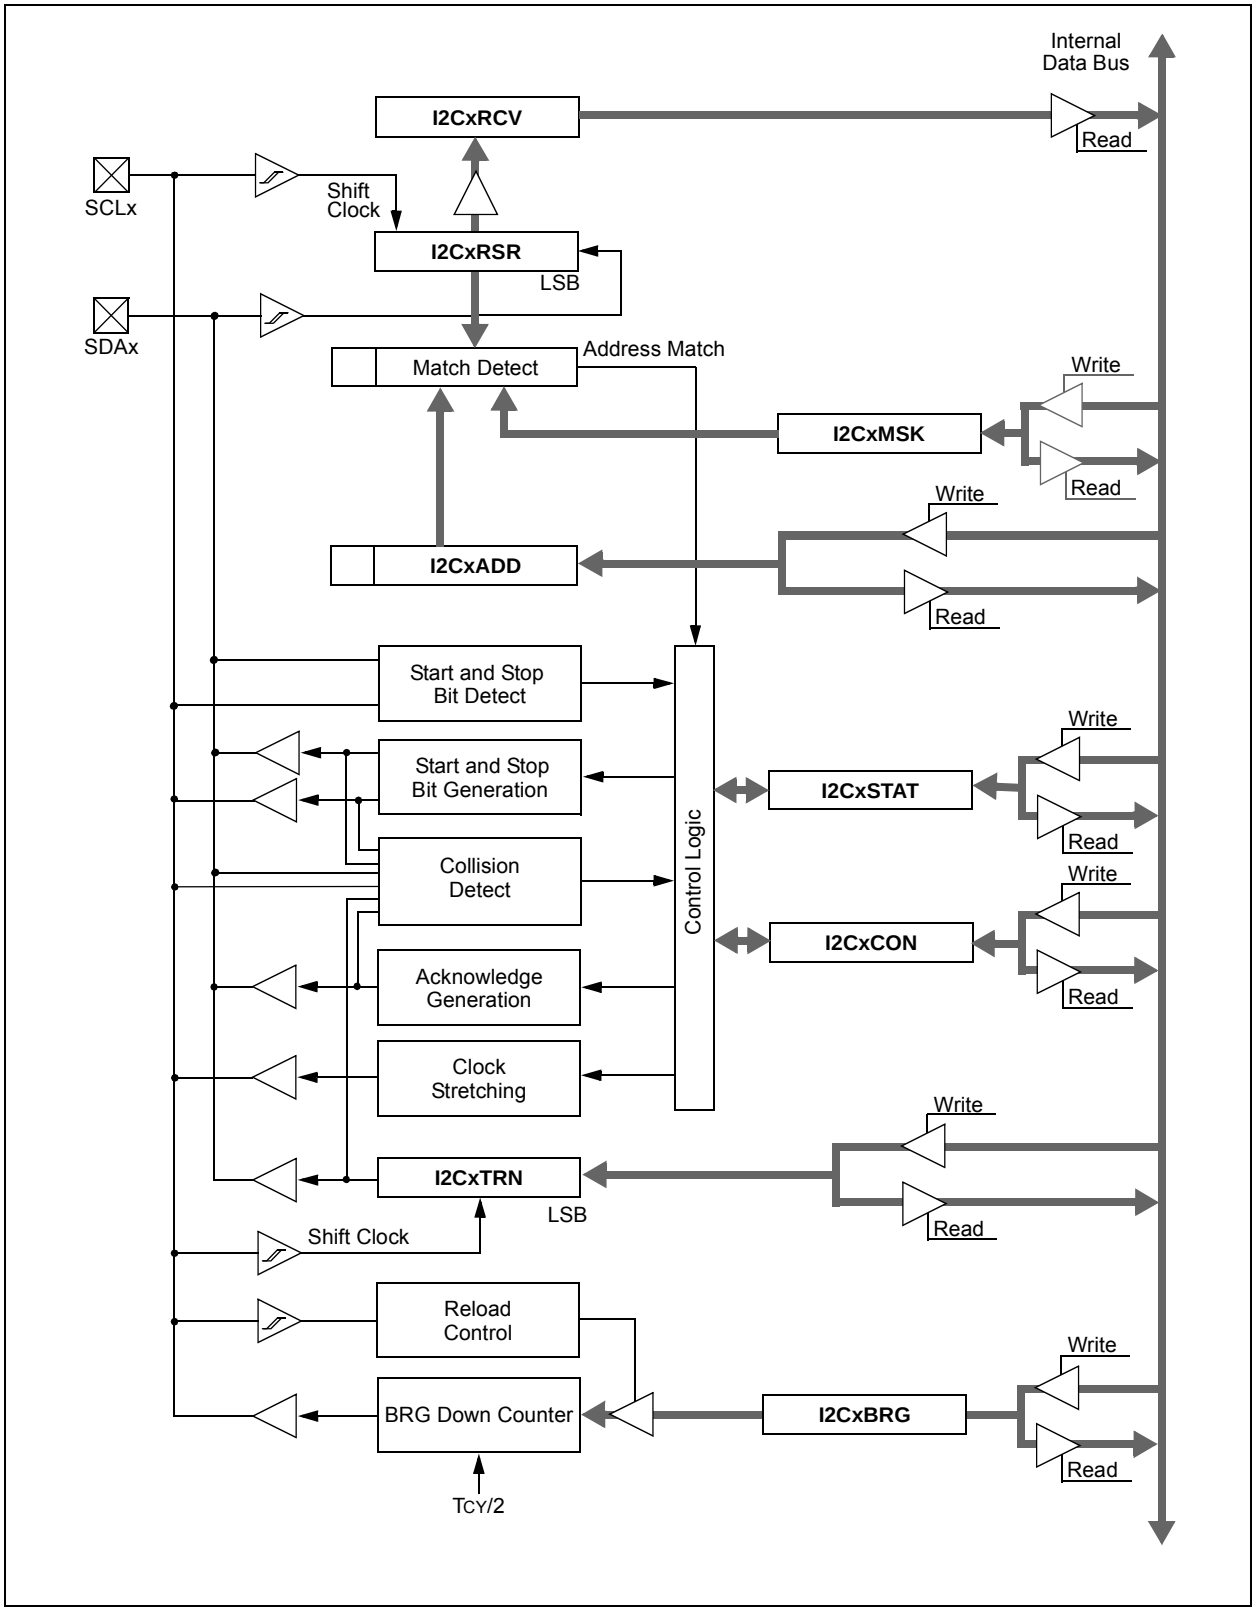
- SDIx: Serial Data Input
- SDOx: Serial Data Output
- SCKx: Shift Clock Input or Output
- $\overline{SS}$x: Active-Low Slave Select or Frame Synchronization I/O Pulse

The SPI module can be configured to operate using 2, 3 or 4 pins. In the 3-pin mode, $\overline{SS}$x is not used. In the 2-pin mode, both SDOx and $\overline{SS}$x are not used.

Block diagrams of the module in Standard and Enhanced modes are shown in Figure 16-1 and Figure 16-2.

Note:	In this section, the SPI modules are referred to together as SPIx or separately as SPI1 or SPI2. Special Function Registers will follow a similar notation. For example, SPIxCON1 and SPIxCON2 refer to the control registers for any of the 2 SPI modules.

FIGURE 17-1: I²C™ BLOCK DIAGRAM



18.2 Transmitting in 8-Bit Data Mode

1. Set up the UART:
   a) Write appropriate values for data, parity and Stop bits.
   b) Write appropriate baud rate value to the UxBRG register.
   c) Set up transmit and receive interrupt enable and priority bits.
2. Enable the UART.
3. Set the UTXEN bit (causes a transmit interrupt, two cycles after being set).
4. Write a data byte to the lower byte of the UxTXREG word. The value will be immediately transferred to the Transmit Shift Register (TSR) and the serial bit stream will start shifting out with the next rising edge of the baud clock.
5. Alternatively, the data byte may be transferred while UTXEN = 0 and then the user may set UTXEN. This will cause the serial bit stream to begin immediately because the baud clock will start from a cleared state.
6. A transmit interrupt will be generated as per interrupt control bit, UTXISELx.

18.3 Transmitting in 9-Bit Data Mode

1. Set up the UART (as described in **Section 18.2 "Transmitting in 8-Bit Data Mode"**).
2. Enable the UART.
3. Set the UTXEN bit (causes a transmit interrupt).
4. Write UxTXREG as a 16-bit value only.
5. A word write to UxTXREG triggers the transfer of the 9-bit data to the TSR. The serial bit stream will start shifting out with the first rising edge of the baud clock.
6. A transmit interrupt will be generated as per the setting of control bit, UTXISELx.

18.4 Break and Sync Transmit Sequence

The following sequence will send a message frame header, made up of a Break, followed by an auto-baud Sync byte.

1. Configure the UART for the desired mode.
2. Set UTXEN and UTXBRK to set up the Break character.
3. Load the UxTXREG with a dummy character to initiate transmission (value is ignored).
4. Write '55h' to UxTXREG; this loads the Sync character into the transmit FIFO.
5. After the Break has been sent, the UTXBRK bit is reset by hardware. The Sync character now transmits.

18.5 Receiving in 8-Bit or 9-Bit Data Mode

1. Set up the UART (as described in **Section 18.2 "Transmitting in 8-Bit Data Mode"**).
2. Enable the UART.
3. A receive interrupt will be generated when one or more data characters have been received as per interrupt control bit, URXISELx.
4. Read the OERR bit to determine if an overrun error has occurred. The OERR bit must be reset in software.
5. Read UxRXREG.

The act of reading the UxRXREG character will move the next character to the top of the receive FIFO, including a new set of PERR and FERR values.

18.6 Operation of $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ Control Pins

UARTx Clear-to-Send ($\overline{\text{UxCTS}}$) and Request-to-Send ($\overline{\text{UxRTS}}$) are the two hardware controlled pins that are associated with the UART module. These two pins allow the UART to operate in Simplex and Flow Control mode. They are implemented to control the transmission and reception between the Data Terminal Equipment (DTE). The UEN<1:0> bits in the UxMODE register configure these pins.

18.7 Infrared Support

The UART module provides two types of infrared UART support: one is the IrDA clock output to support an external IrDA encoder and decoder device (legacy module support), and the other is the full implementation of the IrDA encoder and decoder. Note that because the IrDA modes require a 16x baud clock, they will only work when the BRGH bit (UxMODE<3>) is '0'.

18.7.1 IrDA CLOCK OUTPUT FOR EXTERNAL IrDA SUPPORT

To support external IrDA encoder and decoder devices, the BCLKx pin (same as the $\overline{\text{UxRTS}}$ pin) can be configured to generate the 16x baud clock. With UEN<1:0> = 11, the BCLKx pin will output the 16x baud clock if the UART module is enabled. It can be used to support the IrDA codec chip.

18.7.2 BUILT-IN IrDA ENCODER AND DECODER

The UART has full implementation of the IrDA encoder and decoder as part of the UART module. The built-in IrDA encoder and decoder functionality is enabled using the IREN bit (UxMODE<12>). When enabled (IREN = 1), the receive pin (UxRX) acts as the input from the infrared receiver. The transmit pin (UxTX) acts as the output to the infrared transmitter.

22.2 RTCC Module Registers

The RTCC module registers are organized into three categories:

- RTCC Control Registers
- RTCC Value Registers
- Alarm Value Registers

22.2.1 REGISTER MAPPING

To limit the register interface, the RTCC Timer and Alarm Time registers are accessed through corresponding register pointers. The RTCC Value register window (RTCVALH and RTCVALL) uses the RTCPTR bits (RCFGCAL<9:8>) to select the desired Timer register pair (see Table 22-1).

By writing the RTCVALH byte, the RTCC Pointer value, the RTCPTR<1:0> bits decrement by one until they reach '00'. Once they reach '00', the MINUTES and SECONDS value will be accessible through RTCVALH and RTCVALL until the pointer value is manually changed.

TABLE 22-1: RTCVAL REGISTER MAPPING

RTCPTR<1:0>	RTCC Value Register Window	
	RTCVAL<15:8>	RTCVAL<7:0>
00	MINUTES	SECONDS
01	WEEKDAY	HOURS
10	MONTH	DAY
11	—	YEAR

The Alarm Value register window (ALRMVALH and ALRMVALL) uses the ALRMPTR bits (ALCFGRPT<9:8>) to select the desired Alarm register pair (see Table 22-2).

By writing the ALRMVALH byte, the Alarm Pointer value, ALRMPTR<1:0> bits, decrement by one until they reach '00'. Once they reach '00', the ALRMMIN and ALRMSEC value will be accessible through ALRMVALH and ALRMVALL until the pointer value is manually changed.

TABLE 22-2: ALRMVAL REGISTER MAPPING

ALRMPTR <1:0>	Alarm Value Register Window	
	ALRMVAL<15:8>	ALRMVAL<7:0>
00	ALRMMIN	ALRMSEC
01	ALRMWD	ALRMHR
10	ALRMMNTH	ALRMDAY
11	—	—

Considering that the 16-bit core does not distinguish between 8-bit and 16-bit read operations, the user must be aware that when reading either the ALRMVALH or ALRMVALL bytes, the ALRMPTR<1:0> value will be decremented. The same applies to the RTCVALH or RTCVALL bytes with the RTCPTR<1:0> being decremented.

Note: This only applies to read operations and not write operations.

22.2.2 WRITE LOCK

In order to perform a write to any of the RTCC Timer registers, the RTCWREN bit (RCFGCAL1<13>) must be set (see Example 22-1).

Note: To avoid accidental writes to the timer, it is recommended that the RTCWREN bit (RCFGCAL1<13>) is kept clear at any other time. For the RTCWREN bit to be set, there is only one instruction cycle time window allowed between the 55h/AA sequence and the setting of RTCWREN; therefore, it is recommended that code follow the procedure in Example 22-1.

22.2.3 SELECTING RTCC CLOCK SOURCE

The clock source for the RTCC module can be selected using the RTCLK<1:0> bits in the RTCPWC register. When the bits are set to '00', the Secondary Oscillator (SOSC) is used as the reference clock and when the bits are '01', LPRC is used as the reference clock. When RTCLK<1:0> = 10 and 11, the external power line (50 Hz and 60 Hz) is used as the clock source.

EXAMPLE 22-1: SETTING THE RTCWREN BIT

```
asm volatile("push w7");
asm volatile("push w8");
asm volatile("disi #5");
asm volatile("mov #0x55, w7");
asm volatile("mov w7, _NVMKEY");
asm volatile("mov #0xAA, w8");
asm volatile("mov w8, _NVMKEY");
asm volatile("bset _RCFGCAL1, #13"); //set the RTCWREN bit
asm volatile("pop w8");
asm volatile("pop w7");
```

REGISTER 24-1: AD1CON1: ADC1 CONTROL REGISTER 1 (CONTINUED)

bit 1 **SAMP:** ADC Sample Enable bit
1 = ADC Sample-and-Hold amplifiers are sampling
0 = ADC Sample-and-Hold amplifiers are holding

bit 0 **DONE:** ADC Conversion Status bit
1 = ADC conversion cycle has completed
0 = ADC conversion has not started or is in progress

Note 1: This bit is only available when extended DMA/buffer features are available (DMAEN = 1).

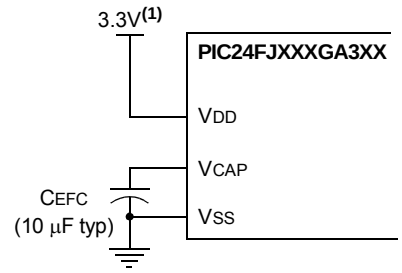
29.2 On-Chip Voltage Regulator

All PIC24FJ128GA310 family devices power their core digital logic at a nominal 1.8V. This may create an issue for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the PIC24FJ128GA310 family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

This regulator is always enabled. It provides a constant voltage (1.8V nominal) to the digital core logic, from a VDD of about 2.1V all the way up to the device's VDDMAX. It does not have the capability to boost VDD levels. In order to prevent "brown-out" conditions when the voltage drops too low for the regulator, the Brown-out Reset occurs. Then the regulator output follows VDD with a typical voltage drop of 300 mV.

A low-ESR capacitor (such as ceramic) must be connected to the VCAP pin (Figure 29-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor (CEFC) is provided in **Section 32.1 "DC Characteristics"**.

FIGURE 29-1: CONNECTIONS FOR THE ON-CHIP REGULATOR



Note 1: This is a typical operating voltage. Refer to **Section 32.0 "Electrical Characteristics"** for the full operating ranges of VDD.

29.2.1 ON-CHIP REGULATOR AND POR

The voltage regulator takes approximately 10 μs for it to generate output. During this time, designated as TVREG, code execution is disabled. TVREG is applied every time the device resumes operation after any power-down, including Sleep mode. TVREG is determined by the status of the VREGS bit (RCON<8>) and the WDTWINx Configuration bits (CW3<11:10>). Refer to **Section 32.0 "Electrical Characteristics"** for more information on TVREG.

Note:	For more information, see **Section 32.0 "Electrical Characteristics"**. The information in this data sheet supersedes the information in the FRM.

29.2.2 VOLTAGE REGULATOR STANDBY MODE

The on-chip regulator always consumes a small incremental amount of current over IDD/IPD, including when the device is in Sleep mode, even though the core digital logic does not require power. To provide additional savings in applications where power resources are critical, the regulator can be made to enter Standby mode on its own whenever the device goes into Sleep mode. This feature is controlled by the VREGS bit (RCON<8>). Clearing the VREGS bit enables the Standby mode. When waking up from Standby mode, the regulator needs to wait for TVREG to expire before wake-up.

29.2.3 LOW-VOLTAGE/RETENTION REGULATOR

When power-saving modes, such as Sleep and Deep Sleep are used, PIC24FJ128GA310 family devices may use a separate low-power, low-voltage/retention regulator to power critical circuits. This regulator, which operates at 1.2V nominal, maintains power to data RAM and the RTCC while all other core digital logic is powered down. It operates only in Sleep, Deep Sleep and VBAT modes.

The low-voltage/retention regulator is described in more detail in **Section 10.1.3 "Low-Voltage/Retention Regulator"**.

TABLE 32-8: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 2V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ(1)**	**Max**	**Units**	**Conditions**
	VIL	**Input Low Voltage(3)**					
DI10		I/O Pins with ST Buffer	VSS	—	0.2 VDD	V	
DI11		I/O Pins with TTL Buffer	VSS	—	0.15 VDD	V	
DI15		$\overline{MCLR}$	VSS	—	0.2 VDD	V	
DI16		OSCI (XT mode)	VSS	—	0.2 VDD	V	
DI17		OSCI (HS mode)	VSS	—	0.2 VDD	V	
DI18		I/O Pins with I2C™ Buffer	VSS	—	0.3 VDD	V	
DI19		I/O Pins with SMBus Buffer	VSS	—	0.8	V	SMBus enabled
	VIH	**Input High Voltage(3)**					
DI20		I/O Pins with ST Buffer:					
		with Analog Functions,	0.8 VDD	—	VDD	V	
		Digital Only	0.8 VDD	—	5.5	V	
DI21		I/O Pins with TTL Buffer:					
		with Analog Functions,	0.25 VDD + 0.8	—	VDD	V	
		Digital Only	0.25 VDD + 0.8	—	5.5	V	
DI25		$\overline{MCLR}$	0.8 VDD	—	VDD	V	
DI26		OSCI (XT mode)	0.7 VDD	—	VDD	V	
DI27		OSCI (HS mode)	0.7 VDD	—	VDD	V	
DI28		I/O Pins with I2C™ Buffer:					
		with Analog Functions,	0.7 VDD	—	VDD	V	
		Digital Only	0.7 VDD	—	5.5	V	
DI29		I/O Pins with SMBus Buffer:					2.5V ≤ VPIN ≤ VDD
		with Analog Functions,	2.1		VDD	V	
		Digital Only	2.1		5.5	V	
DI30	ICNPU	**CNxx Pull-up Current**	150	290	550	μA	VDD = 3.3V, VPIN = VSS
DI30A	ICNPD	**CNxx Pull-down Current**	150	260	550	μA	VDD = 3.3V, VPIN = VDD
	IIL	**Input Leakage Current(2)**					
DI50		I/O Ports	—	—	±1	μA	VSS ≤ VPIN ≤ VDD, pin at high-impedance
			—	—	±1	μA	VSS ≤ VPIN ≤ 5.5, pin at high-impedance
DI51		Analog Input Pins	—	—	±1	μA	VSS ≤ VPIN ≤ VDD, pin at high-impedance
DI55		$\overline{MCLR}$	—	—	±1	μA	VSS ≤ VPIN ≤ VDD
DI56		OSCI/CLKI	—	—	±1	μA	VSS ≤ VPIN ≤ VDD, EC, XT and HS modes

Note 1: Data in the "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: Negative current is defined as current sourced by the pin.

3: Refer to Table 1-4 for I/O pins buffer types.

FIGURE 32-14: SPIx MODULE MASTER MODE TIMING CHARACTERISTICS (CKE = 0)

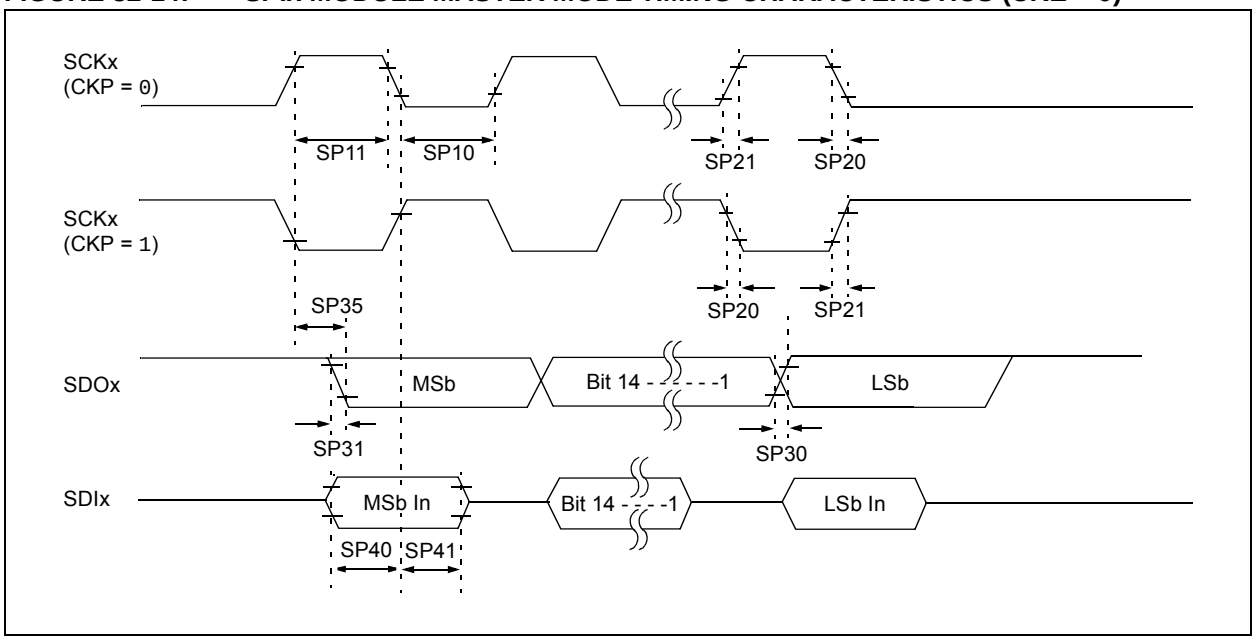


TABLE 32-34: SPIx MASTER MODE TIMING REQUIREMENTS (CKE = 0)

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ(1)**	**Max**	**Units**	**Conditions**
SP10	TscL	SCKx Output Low Time(2)	TCY/2	—	—	ns	
SP11	TscH	SCKx Output High Time(2)	TCY/2	—	—	ns	
SP20	TscF	SCKx Output Fall Time(3)	—	10	25	ns	
SP21	TscR	SCKx Output Rise Time(3)	—	10	25	ns	
SP30	TdoF	SDOx Data Output Fall Time(3)	—	10	25	ns	
SP31	TdoR	SDOx Data Output Rise Time(3)	—	10	25	ns	
SP35	TscH2doV, TscL2doV	SDOx Data Output Valid after SCKx Edge	—	—	30	ns	
SP40	TdiV2scH, TdiV2scL	Setup Time of SDIx Data Input to SCKx Edge	20	—	—	ns	
SP41	TscH2diL, TscL2diL	Hold Time of SDIx Data Input to SCKx Edge	20	—	—	ns	

Note 1: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: The minimum clock period for SCKx is 100 ns; therefore, the clock generated in Master mode must not violate this specification.

3: Assumes 50 pF load on all SPIx pins.

NOTES:
