What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	40 MIPs
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DCI, DMA, I²S, POR, PWM, WDT
Number of I/O	21
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	8K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 10x10b/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-VQFN Exposed Pad
Supplier Device Package	28-QFN-S (6x6)

3.4 Special MCU Features

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 features a 17-bit by 17-bit single-cycle multiplier that is shared by both the MCU ALU and DSP engine. The multiplier can perform signed, unsigned and mixed-sign multiplication. Using a 17-bit by 17-bit multiplier for 16-bit by 16-bit multiplication not only allows you to perform mixed-sign multiplication, it also achieves accurate results for special operations, such as (-1.0) x (-1.0).

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 supports 16/16 and 32/16 divide operations, both fractional and integer. All divide instructions are iterative operations. They must be executed within a `REPEAT` loop, resulting in a total execution time of 19 instruction cycles. The divide operation can be interrupted during any of those 19 cycles without loss of data.

A 40-bit barrel shifter is used to perform up to a 16-bit left or right shift in a single cycle. The barrel shifter can be used by both MCU and DSP instructions.

9.0 OSCILLATOR CONFIGURATION

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 39. "Oscillator (Part III)"** (DS70216) of the "*dsPIC33F/PIC24H Family Reference Manual*", which is available from the Microchip website (www.microchip.com).

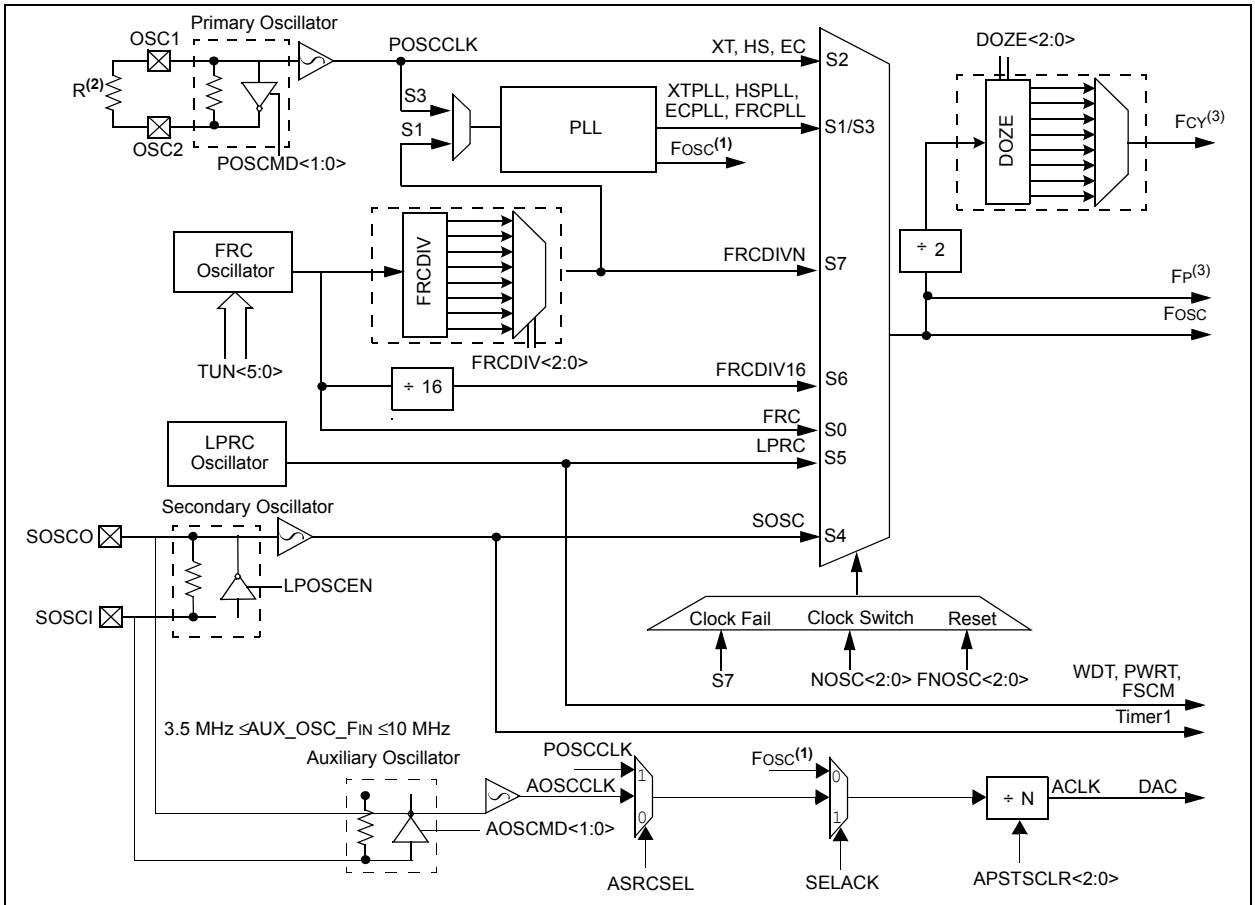
2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 oscillator system provides:

- External and internal oscillator options as clock sources
- An on-chip Phase-Locked Loop (PLL) to scale the internal operating frequency to the required system clock frequency
- An internal FRC oscillator that can also be used with the PLL, thereby allowing full-speed operation without any external clock generation hardware
- Clock switching between various clock sources
- Programmable clock postscaler for system power savings
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and takes fail-safe measures
- An Oscillator Control register (OSCCON)
- Non-volatile Configuration bits for main oscillator selection
- An auxiliary crystal oscillator for Audio DAC

A simplified diagram of the oscillator system is shown in Figure 9-1.

FIGURE 9-1: dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, AND dsPIC33FJ128GPX02/X04 OSCILLATOR SYSTEM DIAGRAM



Note 1: See Figure 9-2 for PLL details.

2: If the Oscillator is used with XT or HS modes, an extended parallel resistor with the value of 1 MΩ must be connected.

3: The term FP refers to the clock source for all the peripherals, while FCY refers to the clock source for the CPU. Throughout this document FCY and FP are used interchangeably, except in the case of Doze mode. FP and FCY will be different when Doze mode is used in any ratio other than 1:1, which is the default.

11.2 Open-Drain Configuration

In addition to the PORT, LAT and TRIS registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired 5V tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

Refer to **"Pin Diagrams"** for the available pins and their functionality.

11.3 Configuring Analog Port Pins

The AD1PCFGL and TRIS registers control the operation of the Analog-to-Digital (ADC) port pins. The port pins that are to function as analog inputs must have their corresponding TRIS bit set (input). If the TRIS bit is cleared (output), the digital output level (VOH or VOL) is converted.

The AD1PCFGL register has a default value of 0x0000; therefore, all pins that share ANx functions are analog (not digital) by default.

When the PORT register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

11.4 I/O Port Write/Read Timing

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be an NOP, as shown in Example 11-1.

11.5 Input Change Notification

The input change notification function of the I/O ports allows the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices to generate interrupt requests to the processor in response to a change-of-state on selected input pins. This feature can detect input change-of-states even in Sleep mode, when the clocks are disabled. Depending on the device pin count, up to 21 external signals (CNx pin) can be selected (enabled) for generating an interrupt request on a change-of-state.

Four control registers are associated with the CN module. The CNEN1 and CNEN2 registers contain the interrupt enable control bits for each of the CN input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each CN pin also has a weak pull-up connected to it. The pull-ups act as a current source connected to the pin, and eliminate the need for external resistors when push-button or keypad devices are connected. The pull-ups are enabled separately using the CNPU1 and CNPU2 registers, which contain the control bits for each of the CN pins. Setting any of the control bits enables the weak pull-ups for the corresponding pins.

Note:	Pull-ups on change notification pins should always be disabled when the port pin is configured as a digital output.

21.0 10-BIT/12-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 16. "Analog-to-Digital Converter (ADC)"** (DS70183) of the "*dsPIC33F/PIC24H Family Reference Manual*", which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices have up to 13 ADC input channels.

The AD12B bit (AD1CON1<10>) allows each of the ADC modules to be configured by the user as either a 10-bit, 4-sample/hold ADC (default configuration) or a 12-bit, 1-sample/hold ADC.

Note: The ADC module needs to be disabled before modifying the AD12B bit.

21.1 Key Features

The 10-bit ADC configuration has the following key features:

- Successive Approximation (SAR) conversion
- Conversion speeds of up to 1.1 Msps
- Up to 13 analog input pins
- External voltage reference input pins
- Simultaneous sampling of up to four analog input pins
- Automatic Channel Scan mode
- Selectable conversion trigger source
- Selectable Buffer Fill modes
- Four result alignment options (signed/unsigned, fractional/integer)
- Operation during CPU Sleep and Idle modes

The 12-bit ADC configuration supports all the above features, except:

- In the 12-bit configuration, conversion speeds of up to 500 ksps are supported
- There is only one sample/hold amplifier in the 12-bit configuration, so simultaneous sampling of multiple channels is not supported

Depending on the particular device pinout, the ADC can have up to 13 analog input pins, designated AN0 through AN12. In addition, there are two analog input pins for external voltage reference connections. These voltage reference inputs can be shared with other analog input pins. The actual number of analog input pins and external voltage reference input configuration depends on the specific device.

Block diagrams of the ADC module are shown in Figure 21-1 and Figure 21-2.

21.2 ADC Initialization

The following configuration steps should be performed.

1. Configure the ADC module:
   a) Select port pins as analog inputs (AD1PCFGH<15:0> or AD1PCFGL<15:0>)
   b) Select voltage reference source to match expected range on analog inputs (AD1CON2<15:13>)
   c) Select the analog conversion clock to match desired data rate with processor clock (AD1CON3<7:0>)
   d) Determine how many S/H channels are used (AD1CON2<9:8> and AD1PCFGH<15:0> or AD1PCFGL<15:0>)
   e) Select the appropriate sample/conversion sequence (AD1CON1<7:5> and AD1CON3<12:8>)
   f) Select how conversion results are presented in the buffer (AD1CON1<9:8>)
   g) Turn on ADC module (AD1CON1<15>)
2. Configure ADC interrupt (if required):
   a) Clear the AD1IF bit
   b) Select ADC interrupt priority

21.3 ADC and DMA

If more than one conversion result needs to be buffered before triggering an interrupt, DMA data transfers can be used. ADC1 can trigger a DMA data transfer. If ADC1 is selected as the DMA IRQ source, a DMA transfer occurs when the AD1IF bit gets set as a result of an ADC1 sample conversion sequence.

The SMPI<3:0> bits (AD1CON2<5:2>) are used to select how often the DMA RAM buffer pointer is incremented.

The ADDMABM bit (AD1CON1<12>) determines how the conversion results are filled in the DMA RAM buffer area being used for ADC. If this bit is set, DMA buffers are written in the order of conversion. The module provides an address to the DMA channel that is the same as the address used for the non-DMA stand-alone buffer. If the ADDMABM bit is cleared, then DMA buffers are written in Scatter/Gather mode. The module provides a scatter/gather address to the DMA channel, based on the index of the analog input and the size of the DMA buffer.

1 = Select ANx for input scan
0 = Skip ANx for input scan

Note 1: On devices without 13 analog inputs, all AD1CSSL bits can be selected by the user application. However, inputs selected for scan without a corresponding input on device converts VREFL.

2: CSSx = ANx, where x = 0 through 12.

1 = Port pin in Digital mode, port read input enabled, ADC input multiplexer connected to AVSS
0 = Port pin in Analog mode, port read input disabled, ADC samples pin voltage

Note 1: On devices without 13 analog inputs, all PCFG bits are R/W by user software. However, the PCFG bits are ignored on ports without a corresponding input on device.

2: PCFGx = ANx, where x = 0 through 12.

3: PCFGx bits have no effect if ADC module is disabled by setting ADxMD bit in the PMDx Register. In this case all port pins multiplexed with ANx will be in Digital mode.

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 30.0 "Electrical Characteristics"	Updated Typical values for Thermal Packaging Characteristics (see Table 30-3). Updated Min and Max values for parameter DC12 (RAM Data Retention Voltage) and added Note 4 (see Table 30-4). Updated Power-Down Current Max values for parameters DC60b and DC60c (see Table 30-7). Updated Characteristics for I/O Pin Input Specifications and added parameter DI21 (see Table 30-9). Updated Program Memory values for parameters 136, 137, and 138 (renamed to 136a, 137a, and 138a), added parameters 136b, 137b, and 138b, and added Note 2 (see Table 30-12). Added parameter OS42 (GM) to the External Clock Timing Requirements (see Table 30-16). Updated Watchdog Timer Time-out Period parameter SY20 (see Table 30-21). Updated the IREF Current Drain parameter AD08 (see Table 30-37). Updated parameters AD30a, AD31a, AD32a, AD33a, and AD34a (see Table 30-38) Updated parameters AD30b, AD31b, AD32b, AD33b, and AD34b (see Table 30-39)

Revision D (November 2009)

The revision includes the following global update:

- Added Note 2 to the shaded table that appears at the beginning of each chapter. This new note provides information regarding the availability of registers and their associated bits

This revision also includes minor typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in the following table.

TABLE A-3: MAJOR SECTION UPDATES

Section Name	Update Description
"High-Performance, 16-bit Digital Signal Controllers"	Added information on high temperature operation (see **"Operating Range:"**).
Section 11.0 "I/O Ports"	Changed the reference to digital-only pins to 5V tolerant pins in the second paragraph of **Section 11.2 "Open-Drain Configuration"**.
Section 18.0 "Universal Asynchronous Receiver Transmitter (UART)"	Updated the two baud rate range features to: 10 Mbps to 38 bps at 40 MIPS.
Section 21.0 "10-bit/12-bit Analog-to-Digital Converter (ADC)"	Updated the ADC block diagrams (see Figure 21-1 and Figure 21-2).
Section 22.0 "Audio Digital-to-Analog Converter (DAC)"	Removed last sentence of the first paragraph in the section. Added a shaded note to **Section 22.2 "DAC Module Operation"**. Updated Figure 22-2: "Audio DAC Output for Ramp Input (Unsigned)".
Section 27.0 "Special Features"	Updated the second paragraph and removed the fourth paragraph in **Section 27.1 "Configuration Bits"**. Updated the Device Configuration Register Map (see Table 27-1).
Section 30.0 "Electrical Characteristics"	Updated the Absolute Maximum Ratings for high temperature and added Note 4. Removed parameters DI26, DI28, and DI29 from the I/O Pin Input Specifications (see Table 30-9). Updated the SPIx Module Slave Mode (CKE = 1) Timing Characteristics (see Figure 30-12). Removed Table 30-43: Audio DAC Module Specifications. Original contents were updated and combined with Table 30-42 of the same name.
Section 31.0 "High Temperature Electrical Characteristics"	Added new chapter with high temperature specifications.
"Product Identification System"	Added the "H" definition for high temperature.
