
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	20MHz
Connectivity	I²C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	25
Program Memory Size	14KB (8K x 14)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 5.5V
Data Converters	A/D 17x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-VQFN Exposed Pad
Supplier Device Package	28-QFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16f1516t-i-ml

1.2 Pin Utilization

Five pins are needed for ICSP™ programming. The pins are listed in Table 1-1 and Table 1-2.

TABLE 1-1: PIN DESCRIPTIONS DURING PROGRAMMING – PIC16(L)F1526 AND PIC16(L)F1527

Pin Name	During Programming		
	Function	Pin Type	Pin Description
RB6	ICSPCLK	I	Clock Input – Schmitt Trigger Input
RB7	ICSPDAT	I/O	Data Input/Output – Schmitt Trigger Input
RG5/$\overline{MCLR}$/VPP	Program/Verify mode	P(1)	Program Mode Select/Programming Power Supply
VDD	VDD	P	Power Supply
VSS	VSS	P	Ground

Legend: I = Input, O = Output, P = Power

Note 1: The programming high voltage is internally generated. To activate the Program/Verify mode, high voltage needs to be applied to $\overline{MCLR}$ input. Since the $\overline{MCLR}$ is used for a level source, $\overline{MCLR}$ does not draw any significant current.

TABLE 1-2: PIN DESCRIPTIONS DURING PROGRAMMING – PIC16(L)F1512, PIC16(L)F1513, PIC16(L)F1516, PIC16(L)F1517, PIC16(L)F1518 and PIC16(L)F1519

Pin Name	During Programming		
	Function	Pin Type	Pin Description
RB6	ICSPCLK	I	Clock Input – Schmitt Trigger Input
RB7	ICSPDAT	I/O	Data Input/Output – Schmitt Trigger Input
RE3/$\overline{MCLR}$/VPP	Program/Verify mode	P(1)	Program Mode Select/Programming Power Supply
VDD	VDD	P	Power Supply
VSS	VSS	P	Ground

Legend: I = Input, O = Output, P = Power

Note 1: The programming high voltage is internally generated. To activate the Program/Verify mode, high voltage needs to be applied to $\overline{MCLR}$ input. Since the $\overline{MCLR}$ is used for a level source, $\overline{MCLR}$ does not draw any significant current.

2.0 DEVICE PINOUTS

The pin diagrams for the PIC16(L)F151X/152X family are shown in Figure 2-1 through Figure 2-7. The pins that are required for programming are listed in Table 1-1 and shown in bold lettering in the pin diagrams.

FIGURE 2-1: 28-PIN SPDIP, SOIC, SSOP DIAGRAM FOR PIC16(L)F1512, PIC16(L)F1513, PIC16(L)F1516 AND PIC16(L)F1518

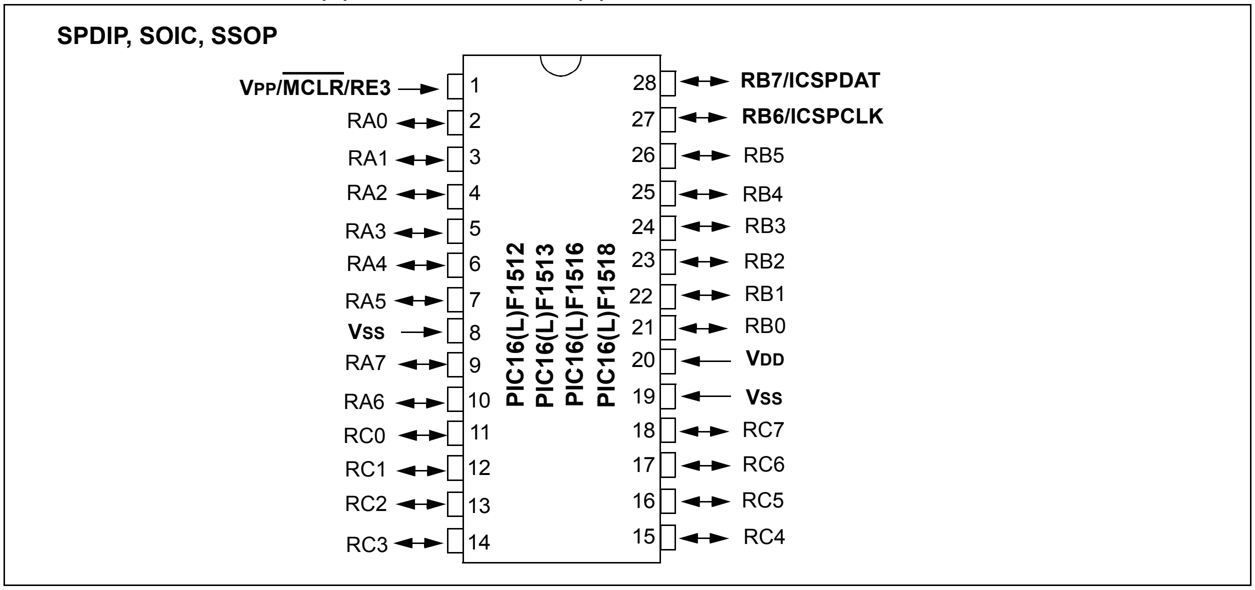

FIGURE 2-2: 28-PIN UQFN DIAGRAM FOR PIC16(L)F1512, PIC16(L)F1513, PIC16(L)F1516 AND PIC16(L)F1518

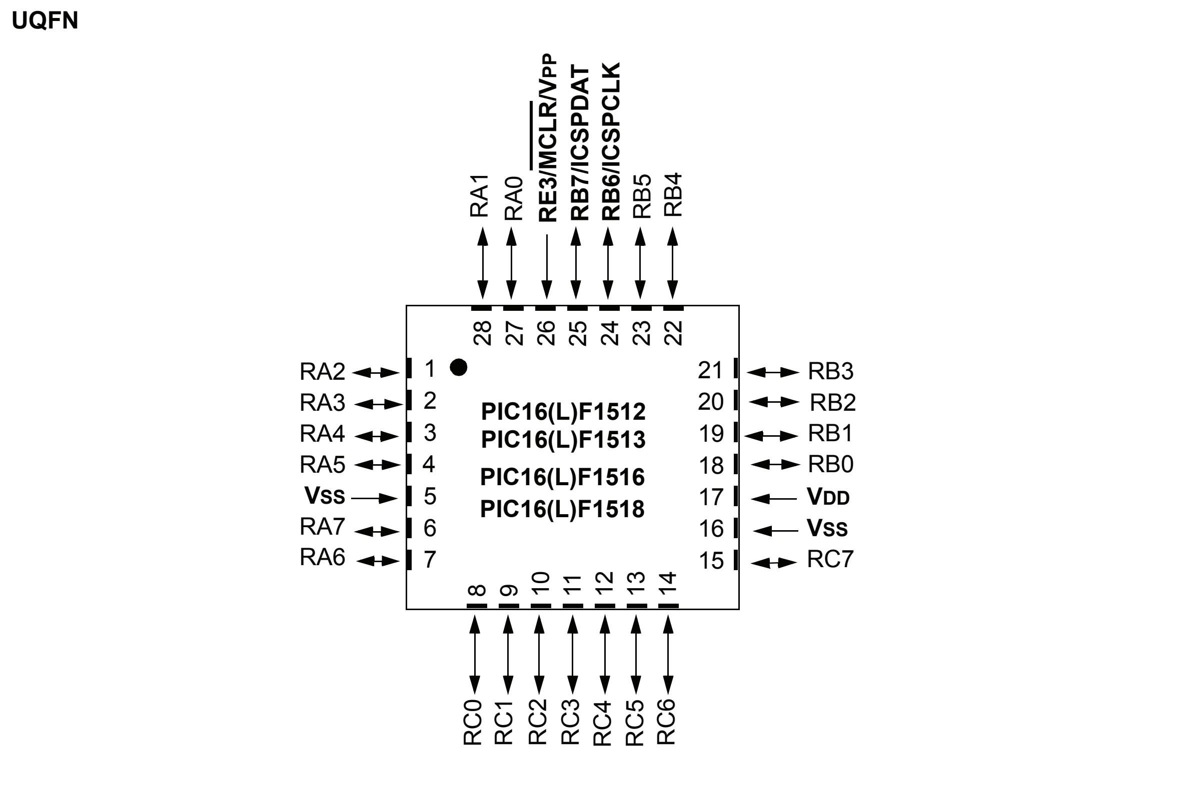

FIGURE 2-3: 40-PIN PDIP DIAGRAM FOR PIC16(L)F1517 AND PIC16(L)F1519

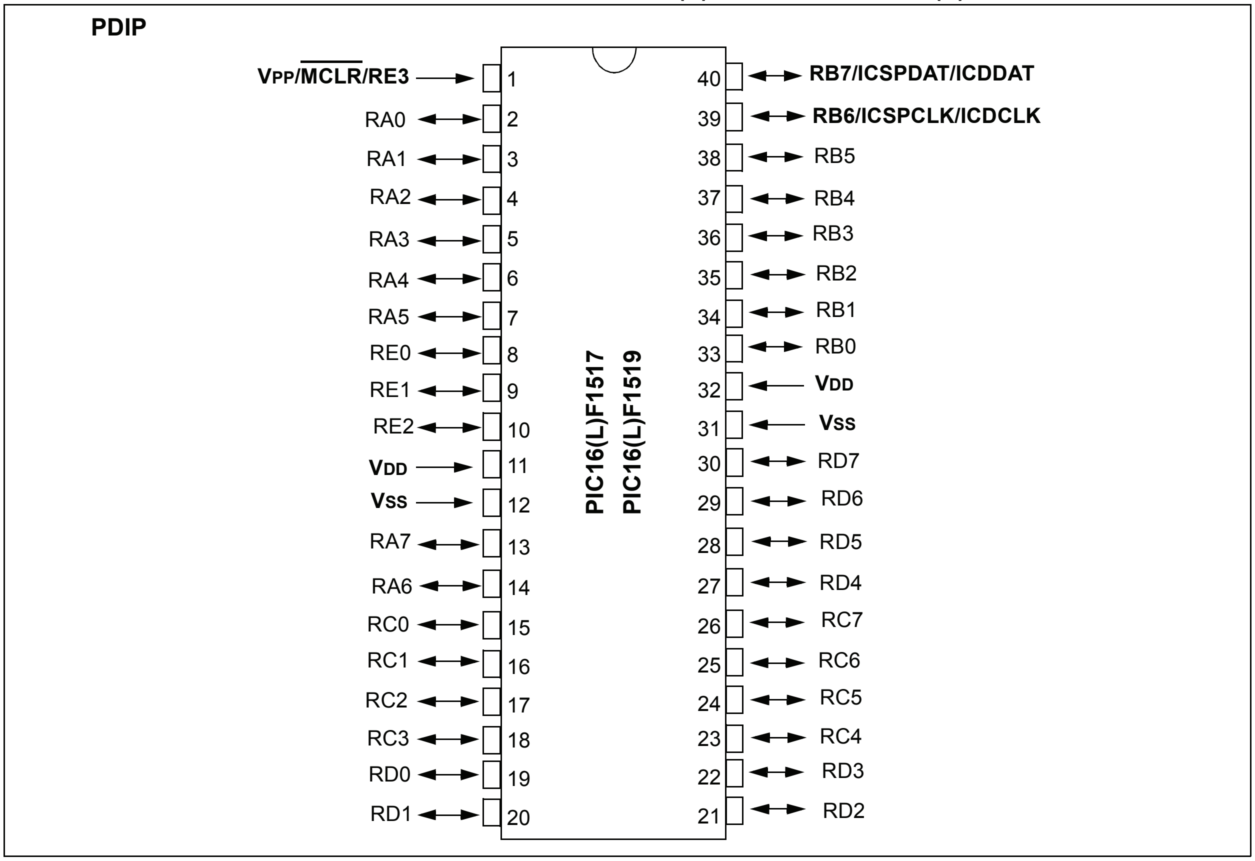

FIGURE 2-4: 40-PIN UQFN DIAGRAM FOR PIC16(L)F1517 AND PIC16(L)F1519

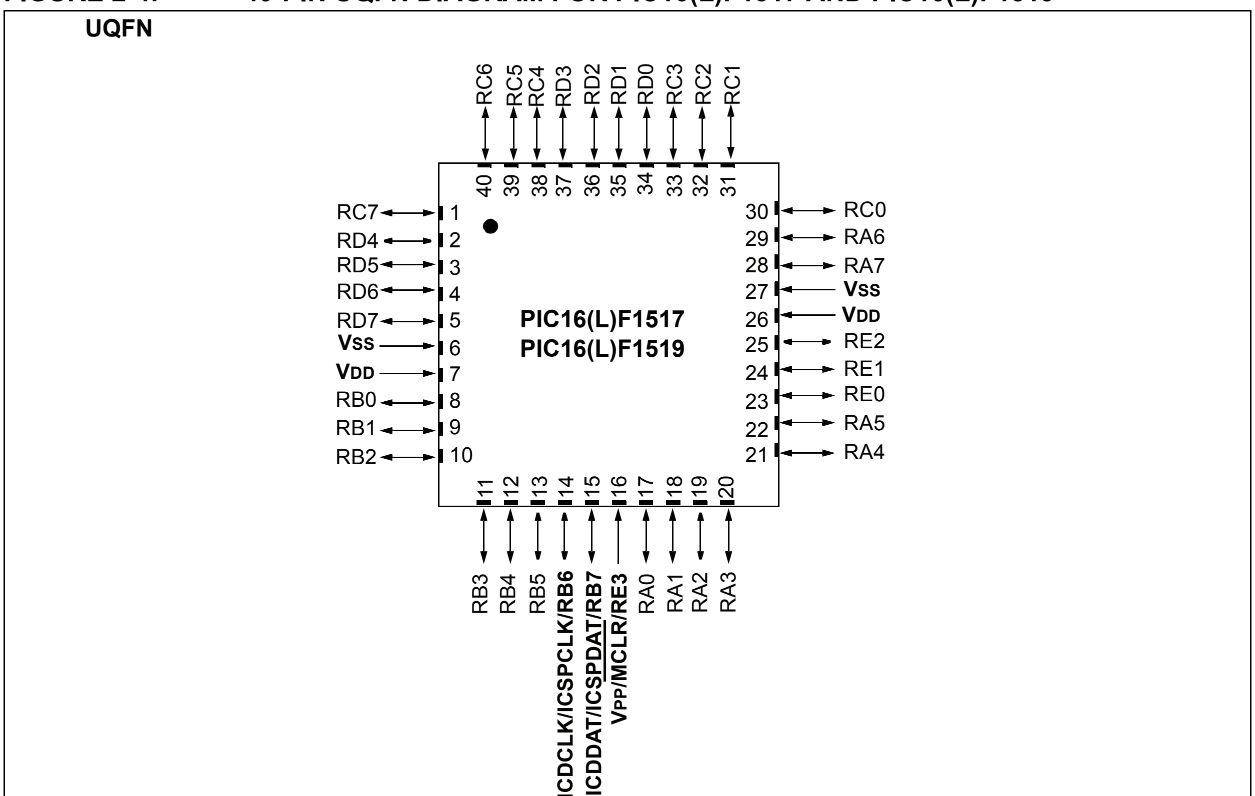

FIGURE 2-5: 44-PIN TQFP DIAGRAM FOR PIC16(L)F1517 AND PIC16(L)F1519

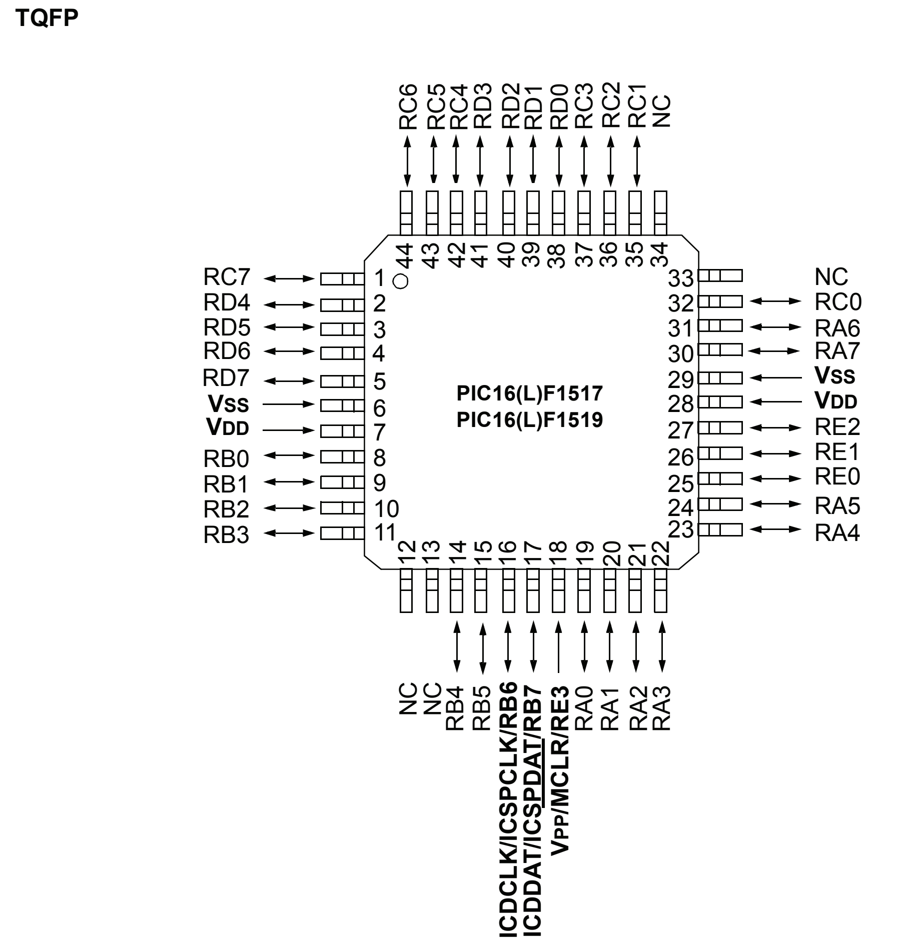


REGISTER 3-3: CONFIGURATION WORD 2

R/P-1	R/P-1	R/P-1	R/P-1	R/P-1	U-1
LVP	$\overline{\text{DEBUG}}$	$\overline{\text{LPBOR}}$	BORV	STVREN	—
bit 13					bit 8

U-1	U-1	U-1	R/P-1	U-1	U-1	R/P-1	R/P-1
—	—	—	$\overline{\text{VCAPEN}}$(2)	—	—	WRT<1:0>	
bit 7							bit 0

Legend:		
R = Readable bit	P = Programmable bit	U = Unimplemented bit, read as '1
'0' = Bit is cleared	'1' = Bit is set	-n = Value when blank or after Bulk Erase

bit 13 **LVP:** Low-Voltage Programming Enable bit(1)
1 = Low-voltage programming enabled
0 = HV on $\overline{\text{MCLR}}$/VPP must be used for programming

bit 12 **$\overline{\text{DEBUG}}$:** In-Circuit Debugger Mode bit
1 = In-Circuit Debugger disabled, ICSPCLK and ICSPDAT are general purpose I/O pins
0 = In-Circuit Debugger enabled, ICSPCLK and ICSPDAT are dedicated to the debugger

bit 11 **$\overline{\text{LPBOR}}$:** Low-Power BOR
1 = Low-Power BOR is disabled
0 = Low-Power BOR is enabled

bit 10 **BORV:** Brown-out Reset Voltage Selection bit
1 = Brown-out Reset voltage (V_{BOR}), low trip point selected
0 = Brown-out Reset voltage (V_{BOR}), high trip point selected

bit 9 **STVREN:** Stack Overflow/Underflow Reset Enable bit
1 = Stack Overflow or Underflow will cause a Reset
0 = Stack Overflow or Underflow will not cause a Reset

bit 8-5 **Unimplemented:** Read as '1'

bit 4 **$\overline{\text{VCAPEN}}$:** Voltage Regulator Capacitor Enable bits(1)
0 = VCAP functionality is enabled on VCAP pin
1 = All VCAP pin functions are disabled

bit 3-2 **Unimplemented:** Read as '1'

bit 1-0 **WRT<1:0>:** Flash Memory Self-Write Protection bits

2 kW Flash memory (PIC16(L)F1512):
- 11 = Write protection off
- 10 = 000h to 1FFh write-protected, 200h to 7FFh may be modified by PMCON control
- 01 = 000h to FFFh write-protected, 400h to 7FFh may be modified by PMCON control
- 00 = 000h to 7FFh write-protected, no addresses may be modified by PMCON control

4 kW Flash memory (PIC16(L)F1513):
- 11 = Write protection off
- 10 = 000h to 1FFh write-protected, 200h to FFFh may be modified by PMCON control
- 01 = 000h to 7FFh write-protected, 800h to FFFh may be modified by PMCON control
- 00 = 000h to FFFh write-protected, no addresses may be modified by PMCON control

8 kW Flash memory (PIC16F/LF1516/1517/1526):
- 11 = Write protection off
- 10 = 000h to 1FFh write-protected, 200h to 1FFFh may be modified by PMCON control
- 01 = 000h to FFFh write-protected, 1000h to 1FFFh may be modified by PMCON control
- 00 = 000h to 1FFFh write-protected, no addresses may be modified by PMCON control

16 kW Flash memory (PIC16F/LF1518/1519/1527):
- 11 = Write protection off
- 10 = 000h to 1FFh write-protected, 200h to 3FFFh may be modified by PMCON control
- 01 = 000h to 1FFFh write-protected, 2000h to 3FFFh may be modified by PMCON control
- 00 = 000h to 3FFFh write-protected, no addresses may be modified by PMCON control

Note 1: The LVP bit cannot be programmed to '0' when Programming mode is entered via LVP.
2: Applies to PIC16F151X/152X devices only. On PIC16LF151X/152X, the $\overline{\text{VCAPEN}}$ bit is unimplemented.

4.0 PROGRAM/VERIFY MODE

In Program/Verify mode, the program memory and the configuration memory can be accessed and programmed in serial fashion. ICSPDAT and ICSPCLK are used for the data and the clock, respectively. All commands and data words are transmitted LSb first. Data changes on the rising edge of the ICSPCLK and latched on the falling edge. In Program/Verify mode both the ICSPDAT and ICSPCLK are Schmitt Trigger inputs. The sequence that enters the device into Program/Verify mode places all other logic into the Reset state. Upon entering Program/Verify mode, all I/Os are automatically configured as high-impedance inputs and the address is cleared.

4.1 High-Voltage Program/Verify Mode Entry and Exit

There are two different methods of entering Program/Verify mode via high-voltage:

- VPP – First entry mode
- VDD – First entry mode

4.1.1 VPP – FIRST ENTRY MODE

To enter Program/Verify mode via the VPP-first method the following sequence must be followed:

1. Hold ICSPCLK and ICSPDAT low. All other pins should be unpowered.
2. Raise the voltage on $\overline{\text{MCLR}}$ from 0V to VIHH.
3. Raise the voltage on VDD FROM 0V to the desired operating voltage.

The VPP-first entry prevents the device from executing code prior to entering Program/Verify mode. For example, when Configuration Word 1 has $\overline{\text{MCLR}}$ disabled (MCLRE = 0), the power-up time is disabled ($\overline{\text{PWRTE}}$ = 0), the internal oscillator is selected (FOSC = 100), and ICSPCLK and ICSPDAT pins are driven by the user application, the device will execute code. Since this may prevent entry, VPP-first entry mode is strongly recommended. See the timing diagram in Figure 8-2.

4.1.2 VDD – FIRST ENTRY MODE

To enter Program/Verify mode via the VDD-first method the following sequence must be followed:

1. Hold ICSPCLK and ICSPDAT low.
2. Raise the voltage on VDD from 0V to the desired operating voltage.
3. Raise the voltage on $\overline{\text{MCLR}}$ from VDD or below to VIHH.

The VDD-first method is useful when programming the device when VDD is already applied, for it is not necessary to disconnect VDD to enter Program/Verify mode. See the timing diagram in Figure 8-1.

4.1.3 PROGRAM/VERIFY MODE EXIT

To exit Program/Verify mode take $\overline{\text{MCLR}}$ to VDD or lower (VIL). See Figures 8-3 and 8-4.

4.2 Low-Voltage Programming (LVP) Mode

The Low-Voltage Programming mode allows the PIC16(L)F151X/152X devices to be programmed using VDD only, without high voltage. When the LVP bit of Configuration Word 2 register is set to ‘1’, the low-voltage ICSP programming entry is enabled. To disable the Low-Voltage ICSP mode, the LVP bit must be programmed to ‘0’. This can only be done while in the High-Voltage Entry mode.

Entry into the Low-Voltage ICSP Program/Verify modes requires the following steps:

1. $\overline{\text{MCLR}}$ is brought to VIL.
2. A 32-bit key sequence is presented on ICSPDAT, while clocking ICSPCLK.

The key sequence is a specific 32-bit pattern, '0100 1101 0100 0011 0100 1000 0101 0000' (more easily remembered as MCHP in ASCII). The device will enter Program/Verify mode only if the sequence is valid. The Least Significant bit of the Least Significant nibble must be shifted in first.

Once the key sequence is complete, $\overline{\text{MCLR}}$ must be held at VIL for as long as Program/Verify mode is to be maintained.

For low-voltage programming timing, see Figure 8-8 and Figure 8-9.

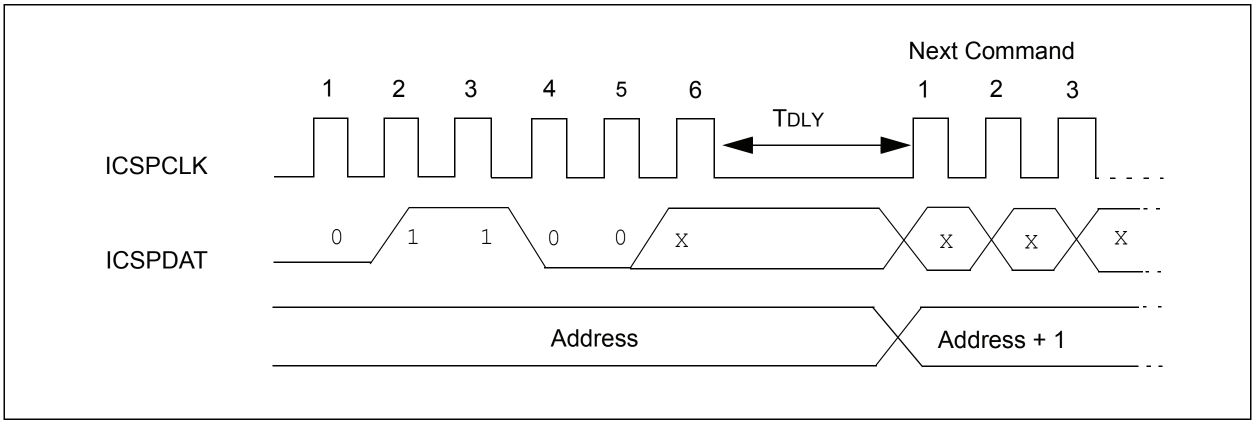
Exiting Program/Verify mode is done by no longer driving $\overline{\text{MCLR}}$ to VIL. See Figure 8-8 and Figure 8-9.

Note:	To enter LVP mode, the LSB of the Least Significant nibble must be shifted in first. This differs from entering the key sequence on other parts.

4.3.4 INCREMENT ADDRESS

The address is incremented when this command is received. It is not possible to decrement the address. To reset this counter, the user must use the Reset Address command or exit Program/Verify mode and re-enter it. If the address is incremented from address 7FFFh, it will wrap-around to location 0000h. If the address is incremented from FFFFh, it will wrap-around to location 8000h.

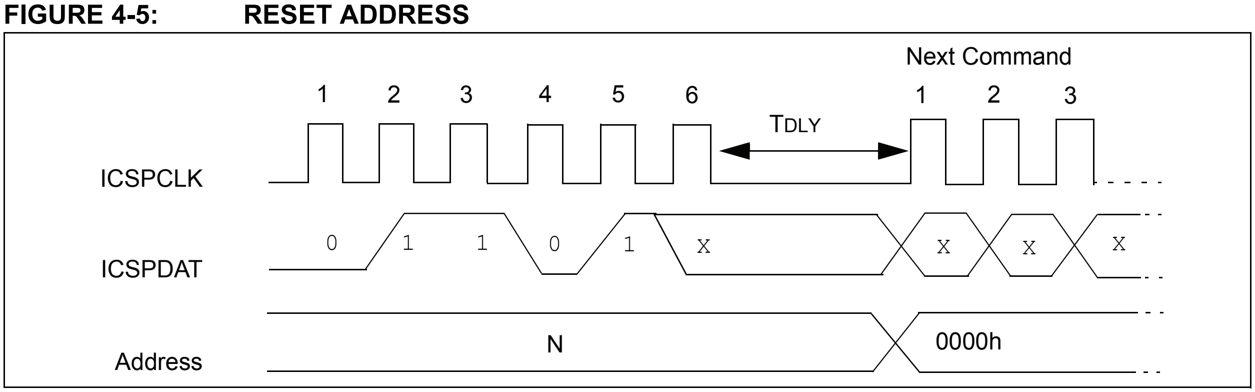
FIGURE 4-4: INCREMENT ADDRESS



4.3.5 RESET ADDRESS

The Reset Address command will reset the address to 0000h, regardless of the current value. The address is used in program memory or the configuration memory.

FIGURE 4-5: RESET ADDRESS



4.3.10 ROW ERASE PROGRAM MEMORY

The Row Erase Program Memory command will erase an individual row. Refer to Table 4-2 for row sizes of specific devices and the PC bits used to address them. If the program memory is code-protected the Row Erase Program Memory command will be ignored. When the address is 8000h-8008h the Row Erase Program Memory command will only erase the user ID locations regardless of the setting of the $\overline{\text{CP}}$ Configuration bit.

After receiving the Row Erase Program Memory command the erase will not complete until the time interval, TERAR, has expired.

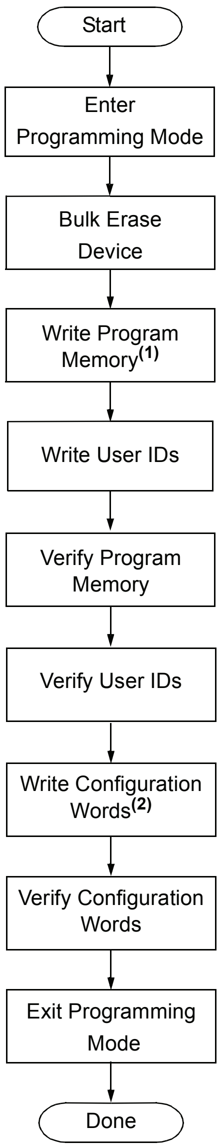
TABLE 4-2: PROGRAMMING ROW SIZE AND LATCHES

Devices	PC	Row Size	Number of Latches
PIC16(L)F151X/152X	<15:5>	32	32

FIGURE 4-10: ROW ERASE PROGRAM MEMORY

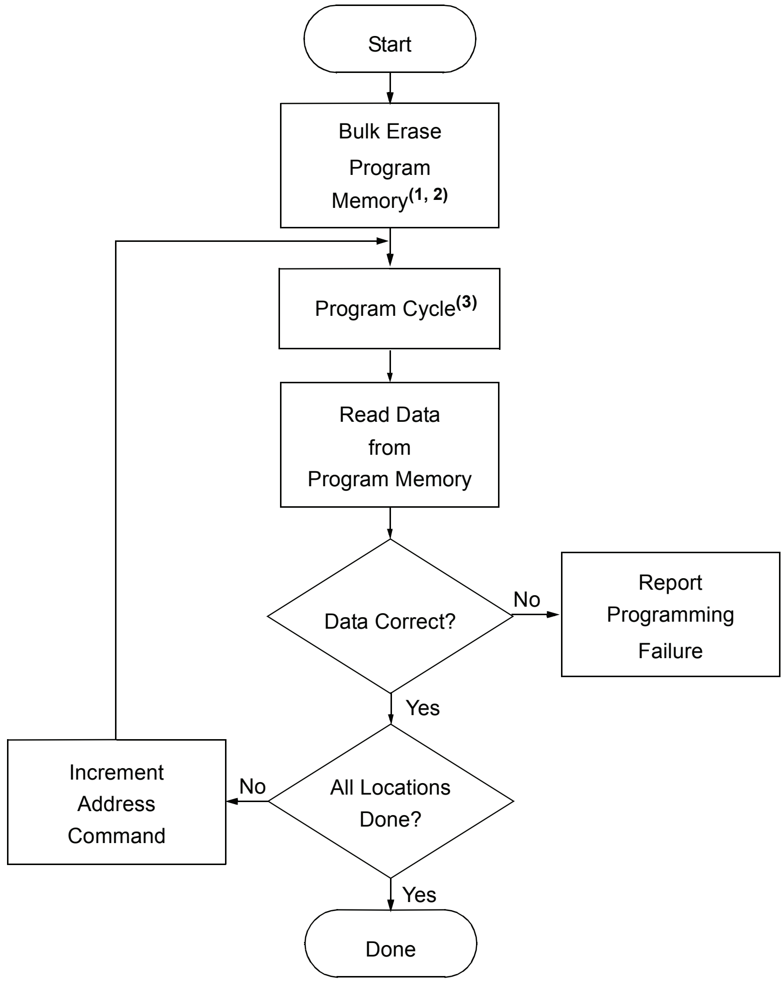
 Advance Information

FIGURE 5-1: DEVICE PROGRAM/VERIFY FLOWCHART



Note 1: See Figure 5-2.
2: See Figure 5-5.

FIGURE 5-2: PROGRAM MEMORY FLOWCHART



Note 1: This step is optional if device has already been erased or has not been previously programmed.

2: If the device is code-protected or must be completely erased, then Bulk Erase device per Figure 5-6.

3: See Figure 5-3 or Figure 5-4.

FIGURE 5-4: MULTIPLE-WORD PROGRAM CYCLE

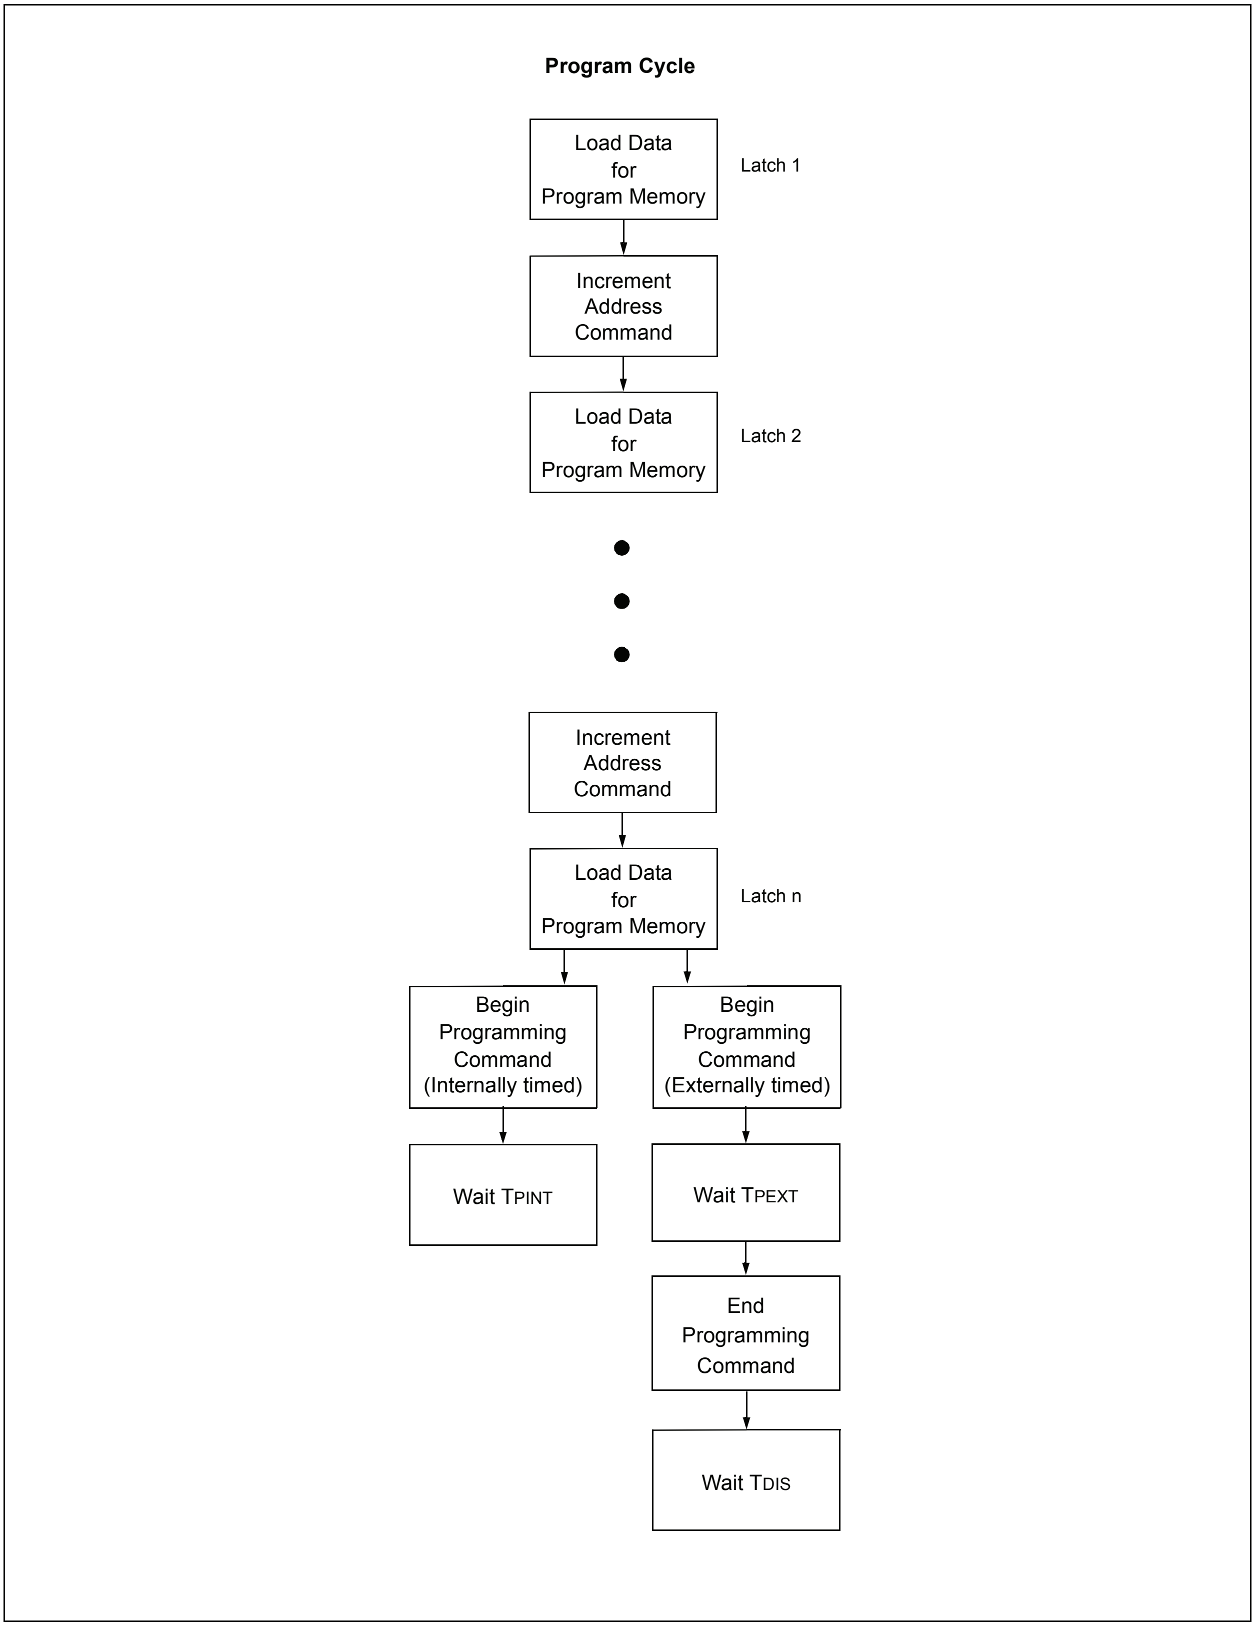


FIGURE 5-5: CONFIGURATION MEMORY PROGRAM FLOWCHART

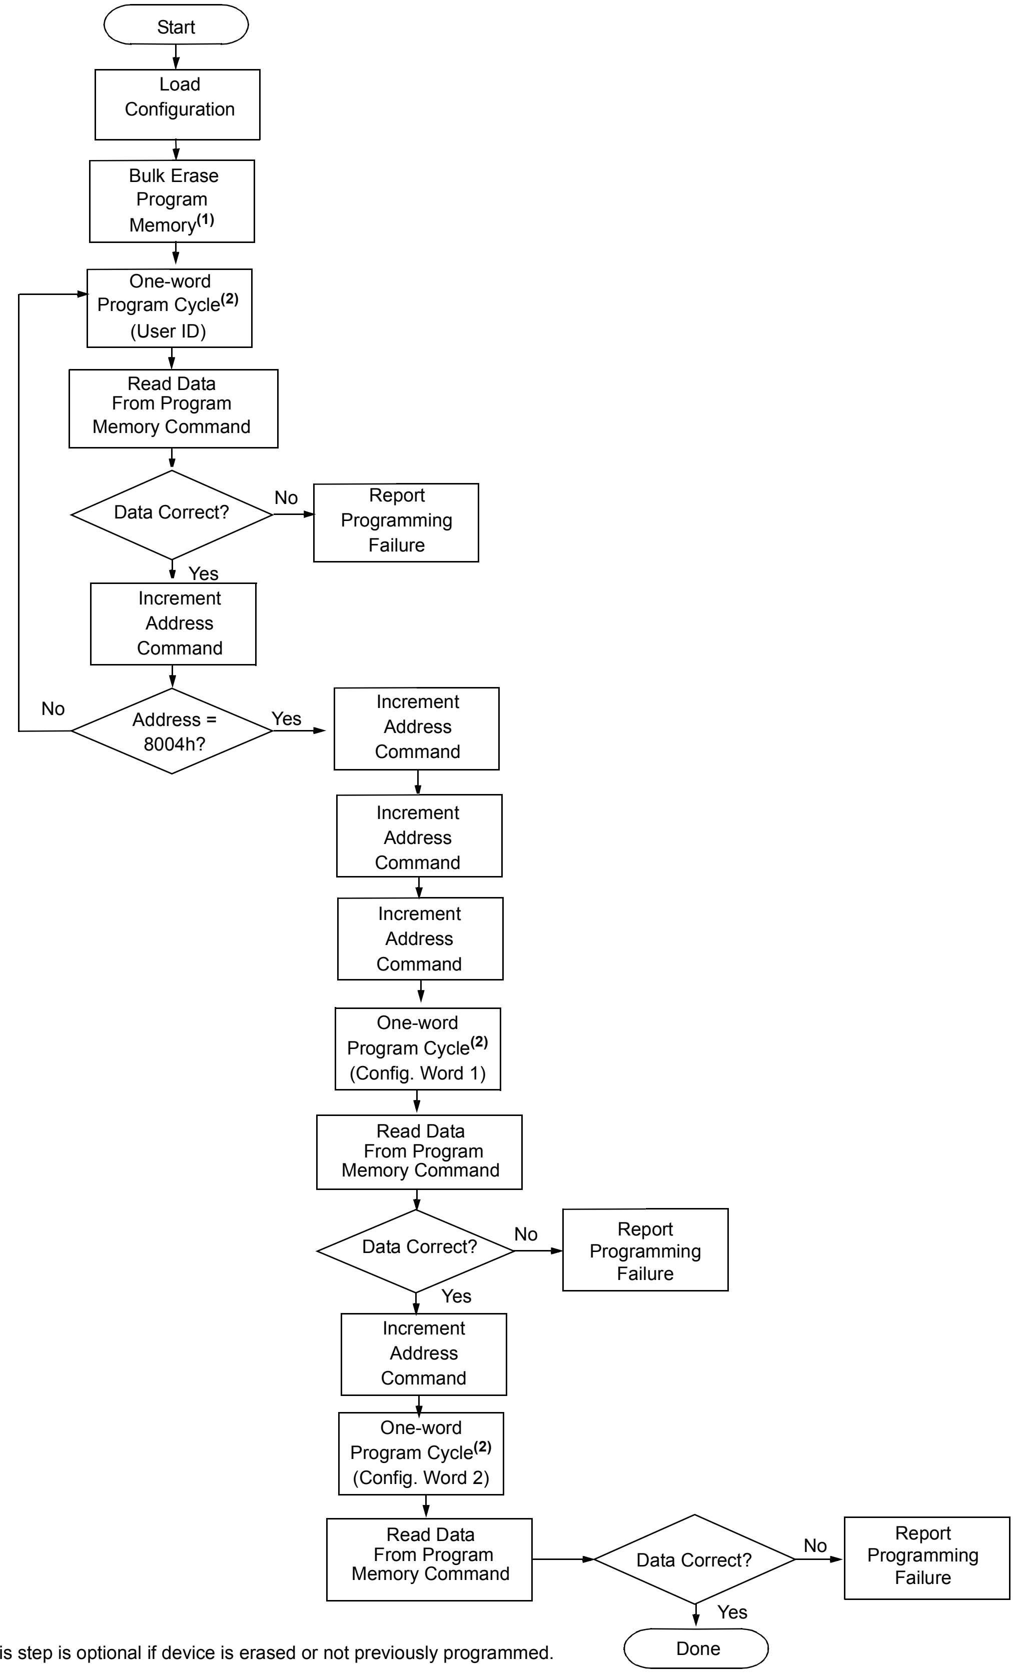
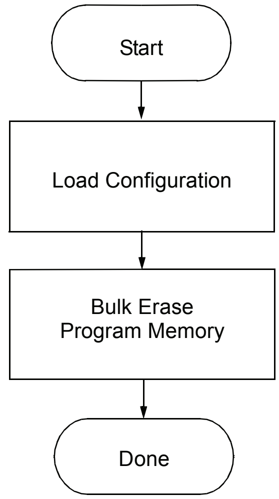


Note 1: This step is optional if device is erased or not previously programmed.

2: See Figure 5-3.

FIGURE 5-6: ERASE FLOWCHART



Note: This sequence does not erase the Calibration Words.

6.0 CODE PROTECTION

Code protection is controlled using the $\overline{CP}$ bit in Configuration Word 1. When code protection is enabled, all program memory locations (0000h-7FFFh) read as all '0'. Further programming is disabled for the program memory (0000h-7FFFh).

The user ID locations and Configuration Words can be programmed and read out regardless of the code protection settings.

6.1 Program Memory

Code protection is enabled by programming the $\overline{CP}$ bit in Configuration Word 1 register to '0'.

The only way to disable code protection is to use the Bulk Erase Program Memory command.

7.0 HEX FILE USAGE

In the hex file there are two bytes per program word stored in the Intel® INHX32 hex format. Data is stored LSB first, MSB second. Because there are two bytes per word, the addresses in the hex file are 2x the address in program memory. (Example: Configuration Word 1 is stored at 8007h on the PIC16(L)F151X/152X. In the hex file this will be referenced as 1000Eh-1000Fh).

7.1 Configuration Word

To allow portability of code, it is strongly recommended that the programmer is able to read the Configuration Words and user ID locations from the hex file. If the Configuration Words information was not present in the hex file, a simple warning message may be issued. Similarly, while saving a hex file, Configuration Words and user ID information should be included.

7.2 Device ID and Revision

If a device ID is present in the hex file at 1000Ch-1000Dh (8006h on the part), the programmer should verify the device ID (excluding the revision) against the value read from the part. On a mismatch condition the programmer should generate a warning message.

 Advance Information

EXAMPLE 7-1: CHECKSUM COMPUTED WITH PROGRAM CODE PROTECTION DISABLED PIC16F1527, BLANK DEVICE

PIC16F1527	Sum of Memory addresses 0000h-3FFFh(1)		C000h
	Configuration Word 1(2)		3FFFh
	Configuration Word 1 mask(3)		3EFFh
	Configuration Word 2(2)		3FFFh
	Configuration Word 2 mask(3)		3E13h
	Checksum	= C000h + (3FFFh and 3EFFh) + (3FFFh and 3E13h)	
		= C000h + 3EFFh + 3E13h	
		= 3D12h	

Note 1: Sum of memory addresses = (Total number of program memory address locations) x (3FFFh) = C000h, truncated to 16 bits.

2: Configuration Word 1 and 2 = all bits are '1'; thus, code-protect is disabled.

3: Configuration Word 1 and 2 Mask = all bits are set to '1', except for unimplemented bits that are '0'.

EXAMPLE 7-2: CHECKSUM COMPUTED WITH PROGRAM CODE PROTECTION DISABLED PIC16LF1527, 00AAh AT FIRST AND LAST ADDRESS

PIC16LF1527	Sum of Memory addresses 0000h-3FFFh(1)		4156h
	Configuration Word 1(2)		3FFFh
	Configuration Word 1 mask(3)		3EFFh
	Configuration Word 2(2)		3FFFh
	Configuration Word 2 mask(4)		3E03h
	Checksum	= 4156h + (3FFFh and 3EFFh) + (3FFFh and 3E03h)	
		= 4156h + 3EFFh + 3E03h	
		= BE58h	

Note 1: Total number of Program memory address locations: 3FFFh + 1 = 4000h. Then, 4000h - 2 = 3FFEh. Thus, [(3FFEh x 3FFFh) + (2 x 00AAh)] = 4156h, truncated to 16 bits.

2: Configuration Word 1 and 2 = all bits are '1'; thus, code-protect is disabled.

3: Configuration Word 1 Mask = all Configuration Word bits are set to '1', except for unimplemented bits that are '0'.

4: On the PIC16LF1527 device, the $\overline{\text{VCAPEN}}$ bit is not implemented in Configuration Word 2; Thus, all unimplemented bits are '0'.

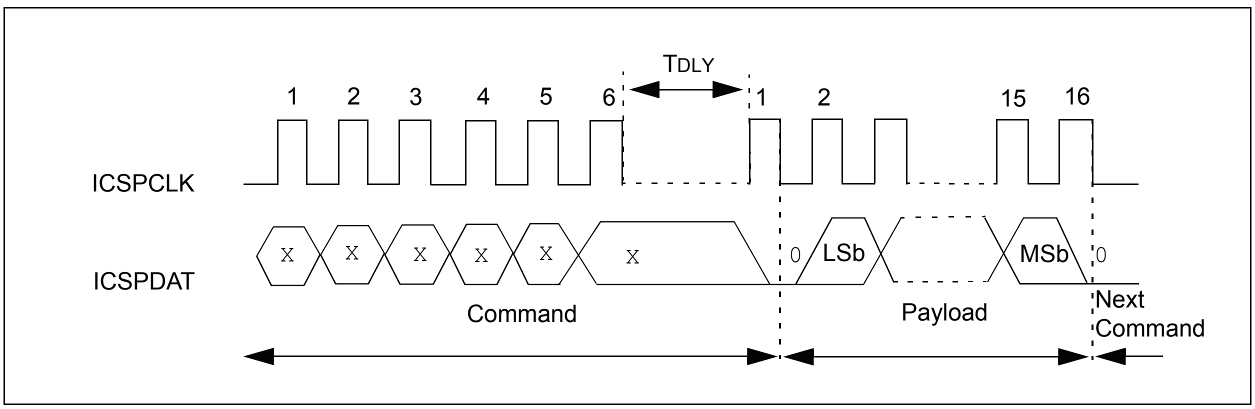

FIGURE 8-7: READ COMMAND-PAYLOAD TIMING

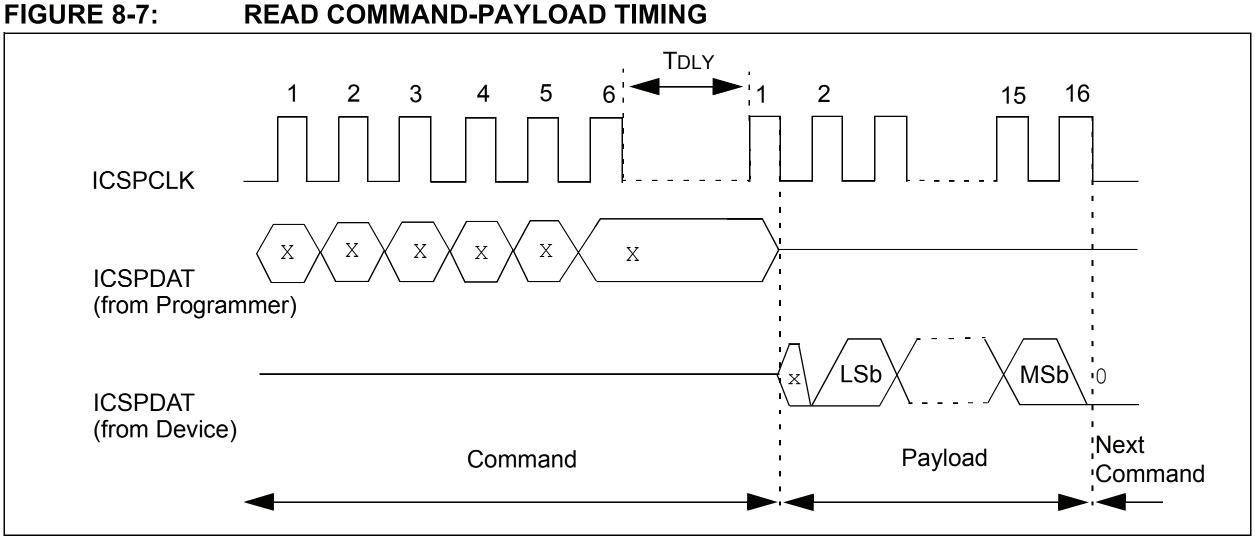

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
ISO/TS 16949:2009

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
