
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	20MHz
Connectivity	I²C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	36
Program Memory Size	14KB (8K x 14)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 5.5V
Data Converters	A/D 28x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Through Hole
Package / Case	40-DIP (0.600", 15.24mm)
Supplier Device Package	40-PDIP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16f1517-e-p

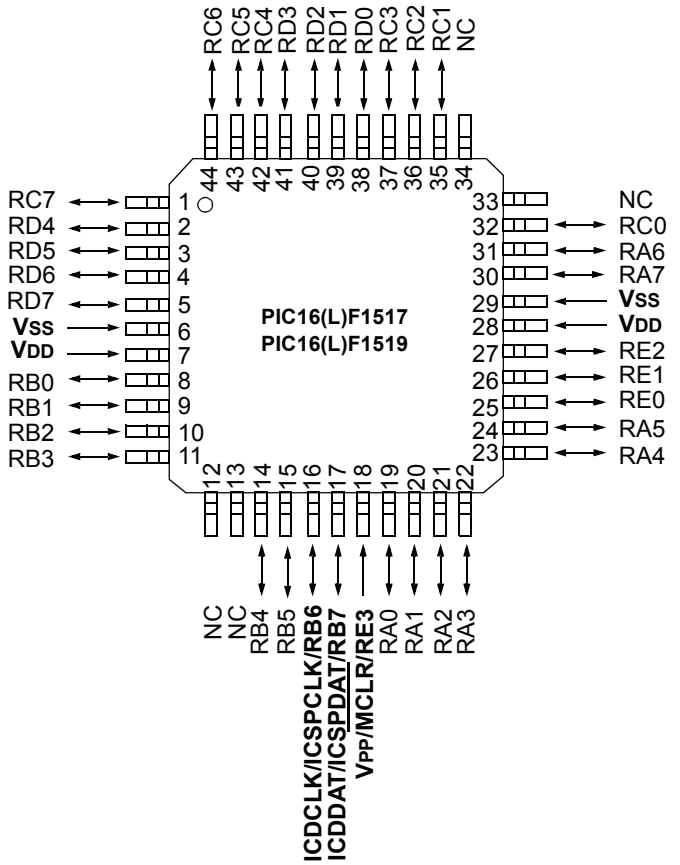
TQFP



3.0 MEMORY MAP

The memory for the PIC16(L)F151X/152X devices is broken into two sections: program memory and configuration memory. Only the size of the program memory changes between devices, the configuration memory remains the same.

FIGURE 3-1: PIC16(L)F1512 PROGRAM MEMORY MAPPING

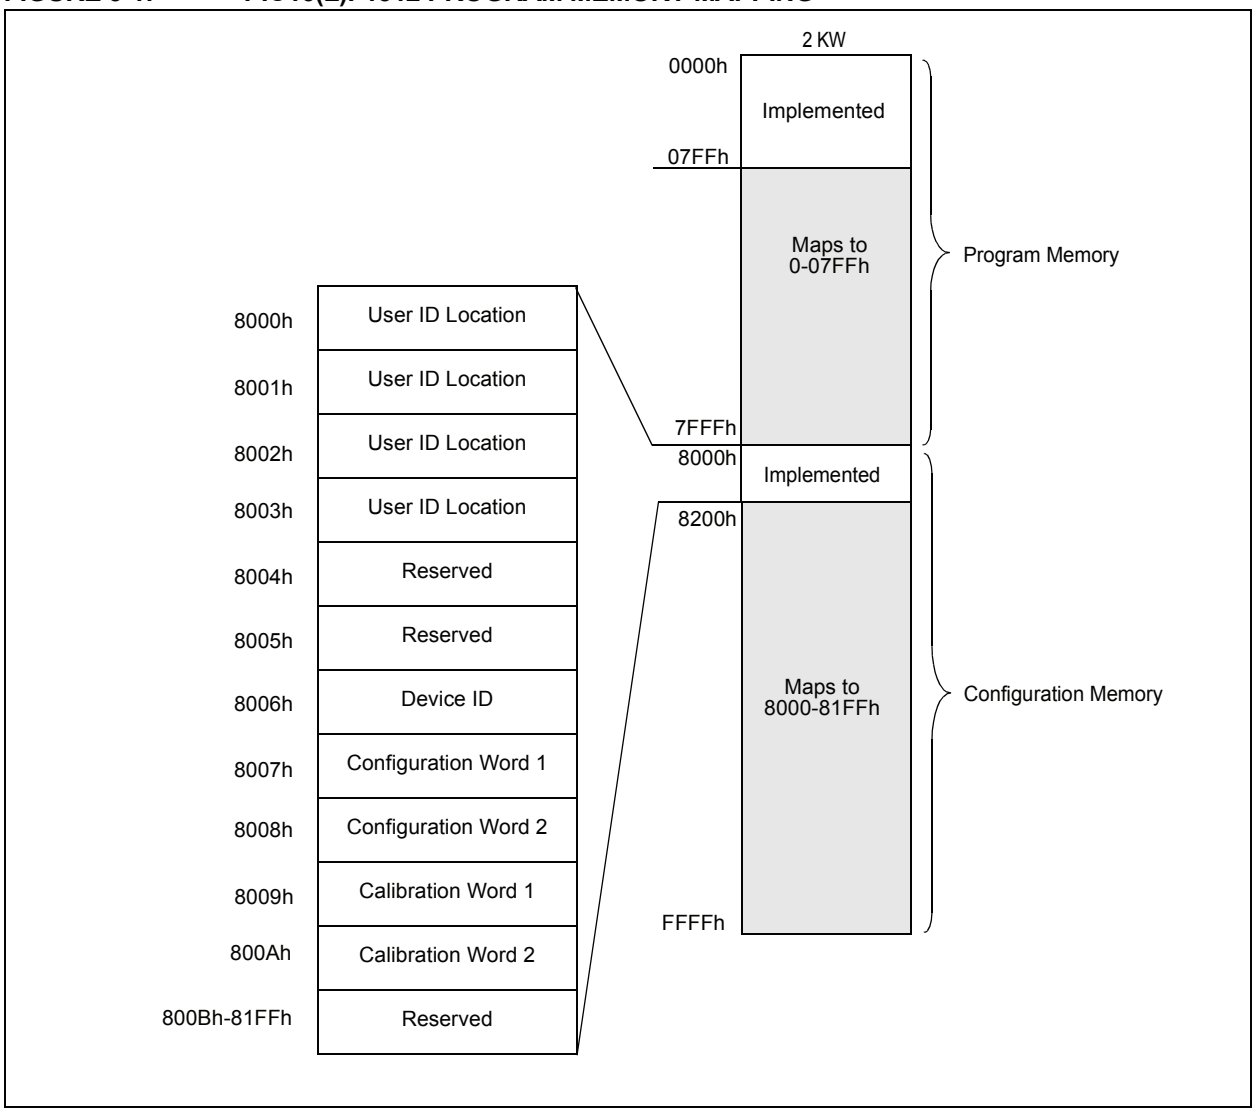


FIGURE 3-4: PIC16(L)F1527, PIC16(L)F1518 AND PIC16(L)F1519 PROGRAM MEMORY MAPPING

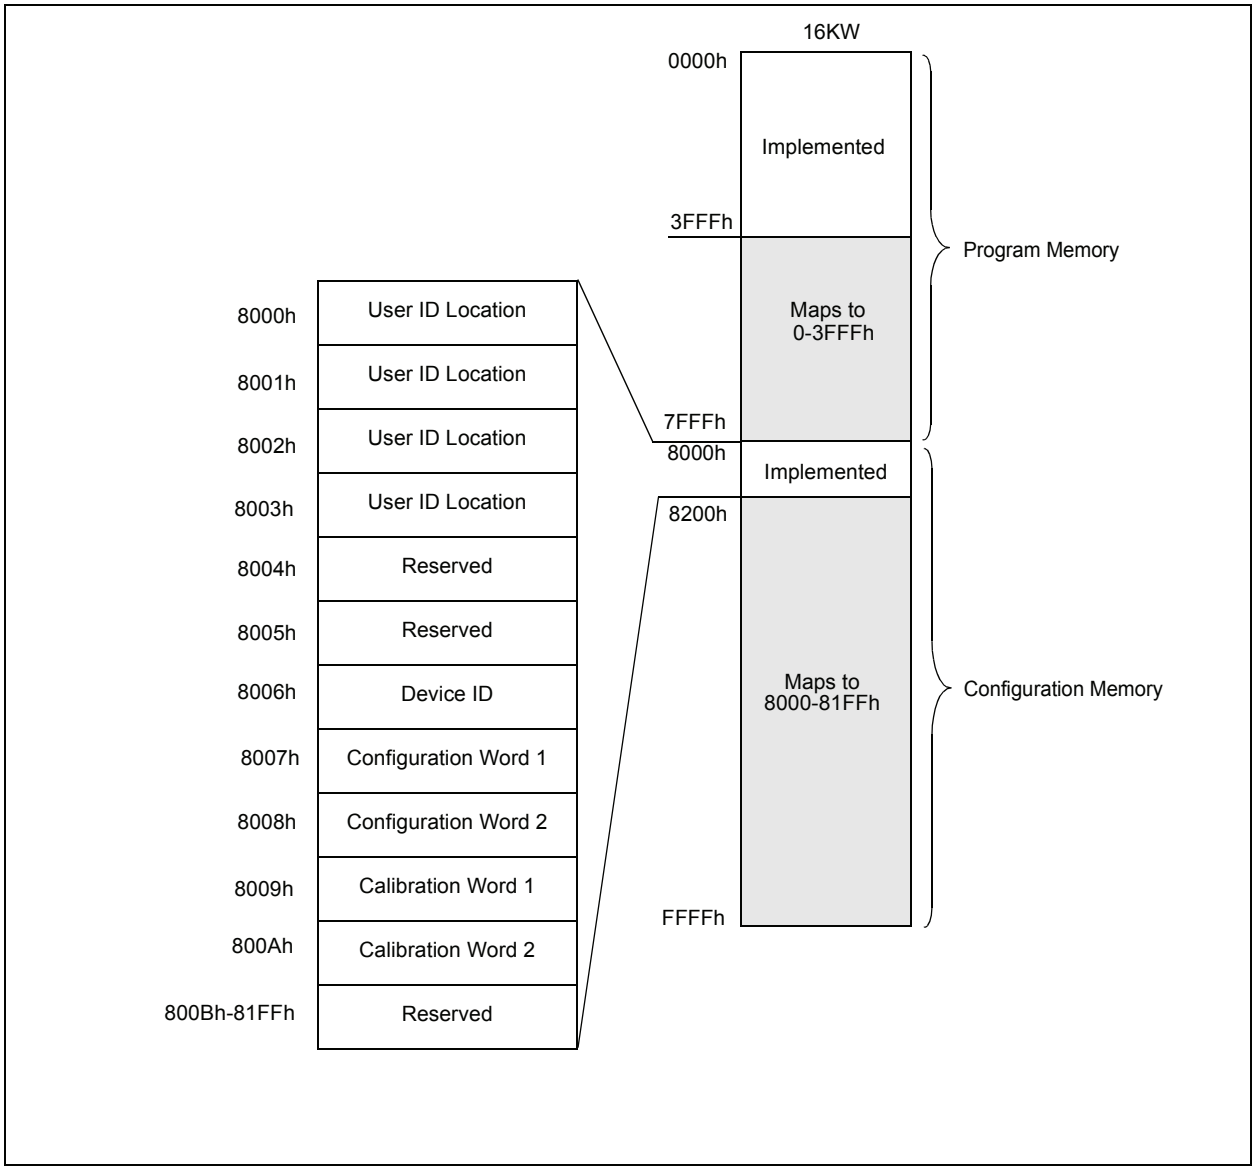

TABLE 3-1: DEVICE ID VALUES

DEVICE	DEVICE ID VALUES	
	DEV	REV
PIC16F1527	0001 0101 101	x xxxx
PIC16F1526	0001 0101 100	x xxxx
PIC16LF1527	0001 0101 111	x xxxx
PIC16LF1526	0001 0101 110	x xxxx
PIC16F1519	0001 0110 111	x xxxx
PIC16F1518	0001 0110 110	x xxxx
PIC16F1517	0001 0110 101	x xxxx
PIC16F1516	0001 0110 100	x xxxx
PIC16F1513	0001 0110 010	x xxxx
PIC16F1512	0001 0111 000	x xxxx
PIC16LF1519	0001 0111 111	x xxxx
PIC16LF1518	0001 0111 110	x xxxx
PIC16LF1517	0001 0111 101	x xxxx
PIC16LF1516	0001 0111 100	x xxxx
PIC16LF1513	0001 0111 010	x xxxx
PIC16LF1512	0001 0111 001	x xxxx

3.3 Configuration Words

There are two Configuration Words, Configuration Word 1 (8007h) and Configuration Word 2 (8008h). The individual bits within these Configuration Words are used to enable or disable device functions such as the Brown-out Reset, code protection and Power-up Timer.

3.4 Calibration Words

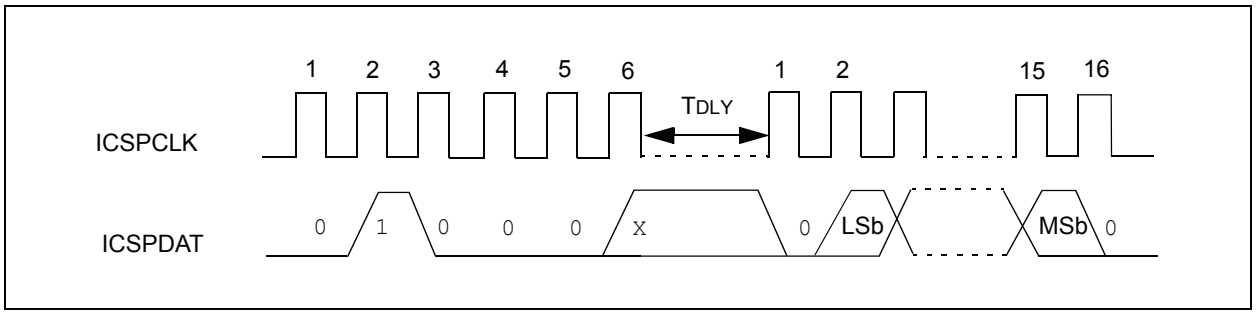
The internal calibration values are factory calibrated and stored in Calibration Words 1 and 2 (8009h, 800Ah).

The Calibration Words do not participate in erase operations. The device can be erased without affecting the Calibration Words.

4.3.2 LOAD DATA FOR PROGRAM MEMORY

The Load Data for Program Memory command is used to load one 14-bit word into the data latches. The word programs into program memory after the Begin Internally Timed Programming or Begin Externally Timed Programming command is issued (see Figure 4-2).

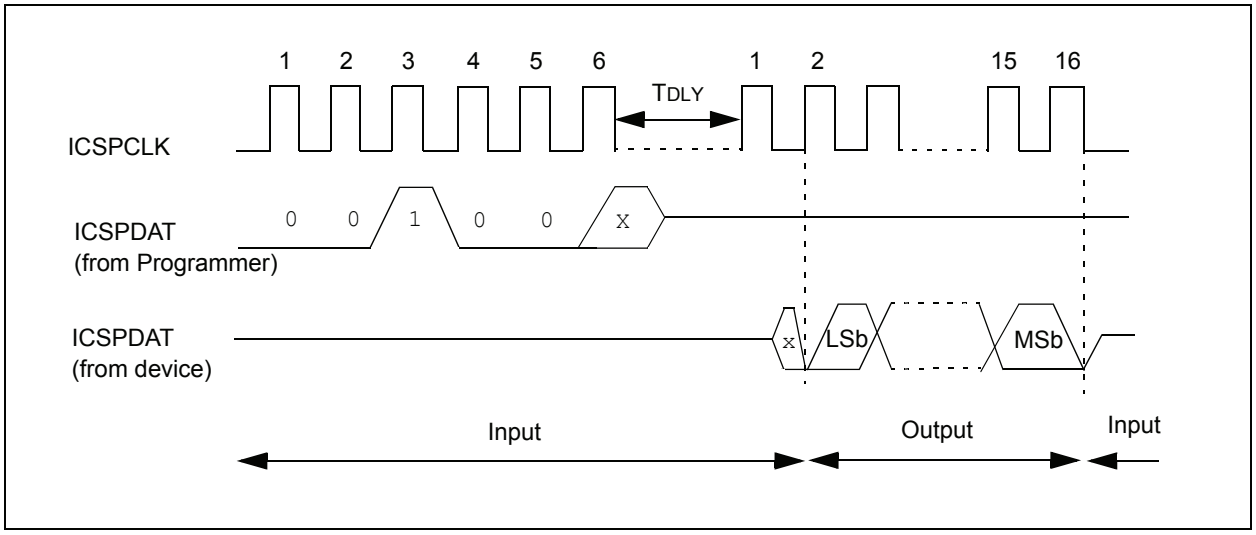
FIGURE 4-2: LOAD DATA FOR PROGRAM MEMORY



4.3.3 READ DATA FROM PROGRAM MEMORY

The Read Data from Program Memory command will transmit data bits out of the program memory map currently accessed, starting with the second rising edge of the clock input. The ICSPDAT pin will go into Output mode on the first falling clock edge, and it will revert to Input mode (high-impedance) after the 16th falling edge of the clock. If the program memory is code-protected ($\overline{CP}$), the data will be read as zeros (see Figure 4-3).

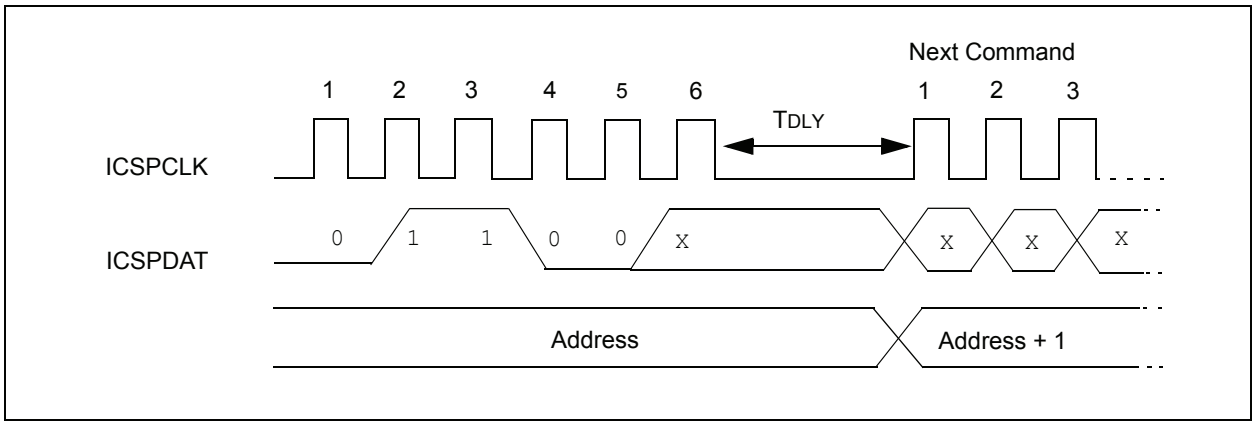
FIGURE 4-3: READ DATA FROM PROGRAM MEMORY



4.3.4 INCREMENT ADDRESS

The address is incremented when this command is received. It is not possible to decrement the address. To reset this counter, the user must use the Reset Address command or exit Program/Verify mode and re-enter it. If the address is incremented from address 7FFFh, it will wrap-around to location 0000h. If the address is incremented from FFFFh, it will wrap-around to location 8000h.

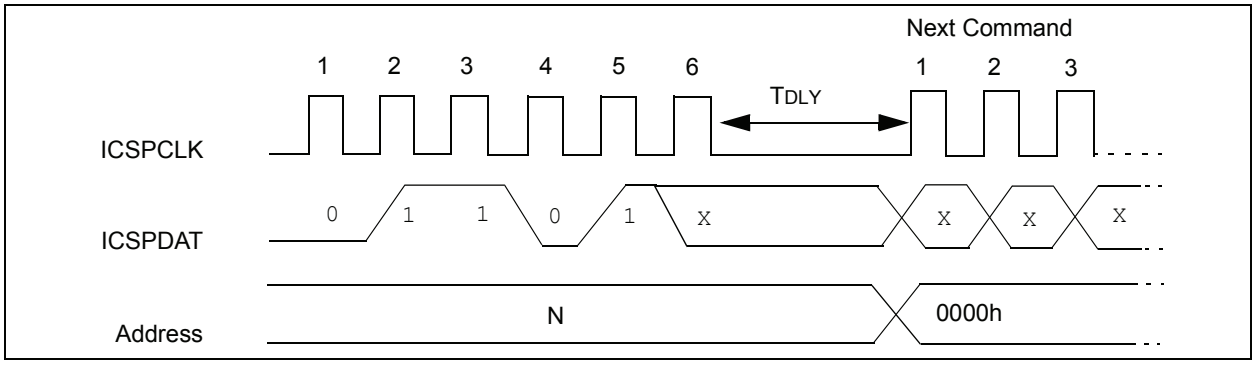
FIGURE 4-4: INCREMENT ADDRESS



4.3.5 RESET ADDRESS

The Reset Address command will reset the address to 0000h, regardless of the current value. The address is used in program memory or the configuration memory.

FIGURE 4-5: RESET ADDRESS



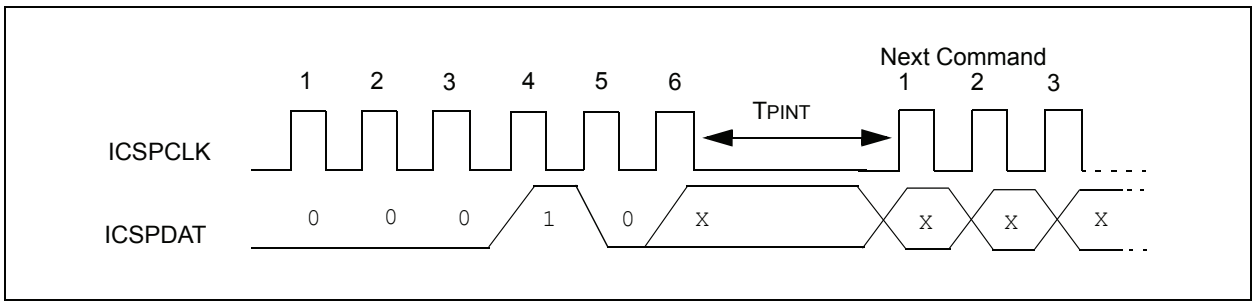
4.3.6 BEGIN INTERNALLY TIMED PROGRAMMING

A Load Configuration or Load Data for Program Memory command must be given before every Begin Programming command. Programming of the addressed memory will begin after this command is received. An internal timing mechanism executes the write. The user must allow for the program cycle time, TPINT, for the programming to complete.

The End Externally Timed Programming command is not needed when the Begin Internally Timed Programming is used to start the programming.

The program memory address that is being programmed is not erased prior to being programmed.

FIGURE 4-6: BEGIN INTERNALLY TIMED PROGRAMMING

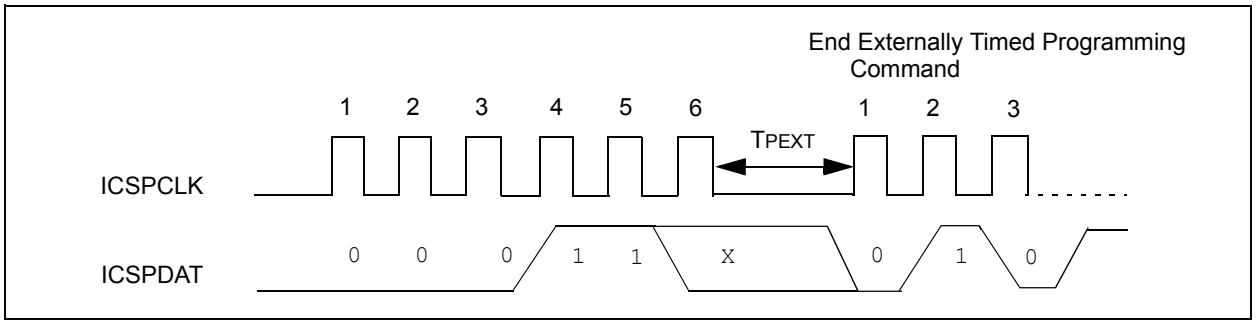


4.3.7 BEGIN EXTERNALLY TIMED PROGRAMMING

A Load Configuration or Load Data for Program Memory command must be given before every Begin Programming command. Programming of the addressed memory will begin after this command is received. To complete the programming the End Externally Timed Programming command must be sent in the specified time window defined by TPEXT (see Figure 4-7).

Externally timed writes are not supported for Configuration and Calibration bits. Any externally timed write to the Configuration or Calibration Word will have no effect on the targeted word.

FIGURE 4-7: BEGIN EXTERNALLY TIMED PROGRAMMING

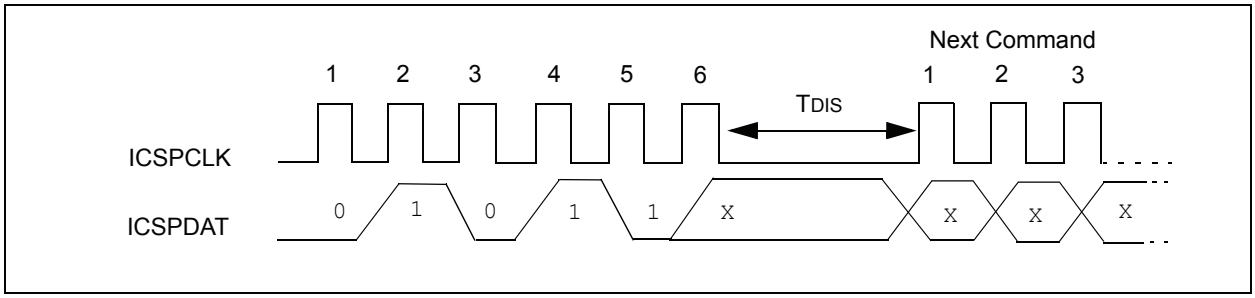


4.3.8 END EXTERNALLY TIMED PROGRAMMING

This command is required after a Begin Externally Timed Programming command is given. This command must be sent within the time window specified by TPEXT after the Begin Externally Timed Programming command is sent.

After sending the End Externally Timed Programming command, an additional delay (TDIS) is required before sending the next command. This delay is longer than the delay ordinarily required between other commands (see Figure 4-8).

FIGURE 4-8: END EXTERNALLY TIMED PROGRAMMING



4.3.9 BULK ERASE PROGRAM MEMORY

The Bulk Erase Program Memory command performs two different functions dependent on the current state of the address.

Address 0000h-7FFFh:

- Program Memory is erased
- Configuration Words are erased

Address 8000h-8008h:

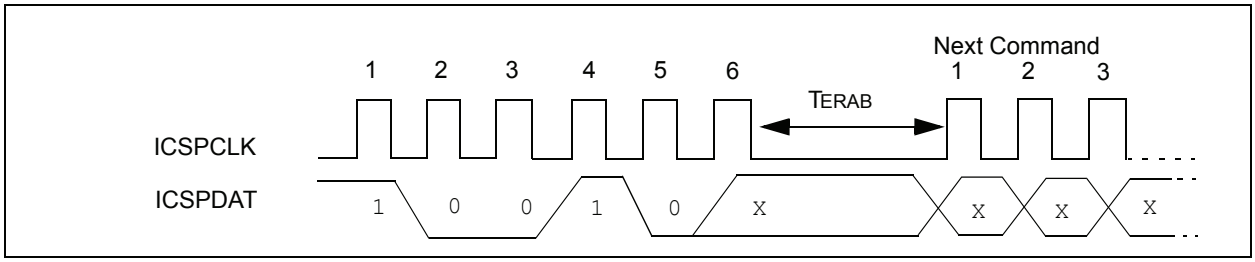
- Program Memory is erased
- Configuration Words are erased
- User ID Locations are erased

A Bulk Erase Program Memory command should not be issued when the address is greater than 8008h.

After receiving the Bulk Erase Program Memory command the erase will not complete until the time interval, TERAB, has expired.

Note:	The code protection Configuration bit ($\overline{CP}$) has no effect on the Bulk Erase Program Memory command.

FIGURE 4-9: BULK ERASE PROGRAM MEMORY



4.3.10 ROW ERASE PROGRAM MEMORY

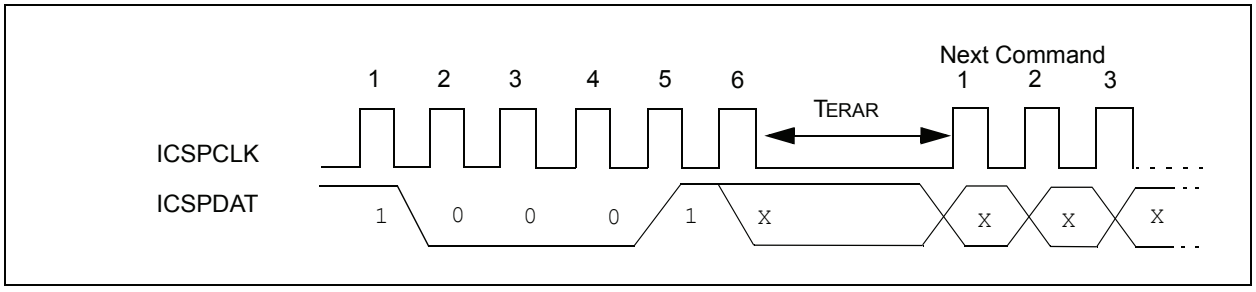
The Row Erase Program Memory command will erase an individual row. Refer to Table 4-2 for row sizes of specific devices and the PC bits used to address them. If the program memory is code-protected the Row Erase Program Memory command will be ignored. When the address is 8000h-8008h the Row Erase Program Memory command will only erase the user ID locations regardless of the setting of the $\overline{CP}$ Configuration bit.

After receiving the Row Erase Program Memory command the erase will not complete until the time interval, TERAR, has expired.

TABLE 4-2: PROGRAMMING ROW SIZE AND LATCHES

Devices	PC	Row Size	Number of Latches
PIC16(L)F151X/152X	<15:5>	32	32

FIGURE 4-10: ROW ERASE PROGRAM MEMORY



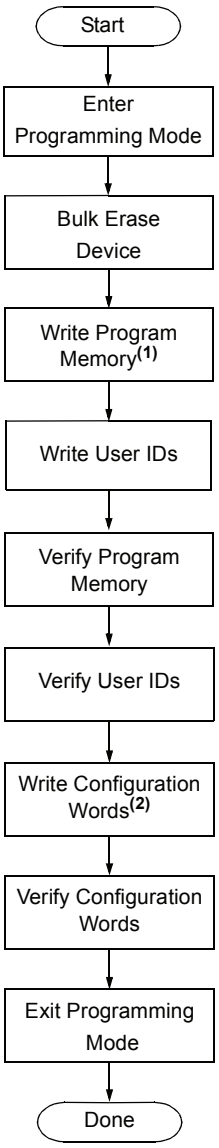
5.0 PROGRAMMING ALGORITHMS

The devices use internal latches to temporarily store the 14-bit words used for programming. Refer to Table 4-2 for specific latch information. The data latches allow the user to write the program words with a single Begin Externally Timed Programming or Begin Internally Timed Programming command. The Load Program Data or the Load Configuration command is used to load a single data latch. The data latch will hold the data until the Begin Externally Timed Programming or Begin Internally Timed Programming command is given.

The data latches are aligned with the LSbs of the address. The PC's address at the time the Begin Externally Timed Programming or Begin Internally Timed Programming command is given will determine which location(s) in memory are written. Writes cannot cross the physical boundary. For example, with the PIC16F1527, attempting to write from address 0002h-0009h will result in data being written to 0008h-000Fh.

If more than the maximum number of data latches are written without a Begin Externally Timed Programming or Begin Internally Timed Programming command, the data in the data latches will be overwritten. The following figures show the recommended flowcharts for programming.

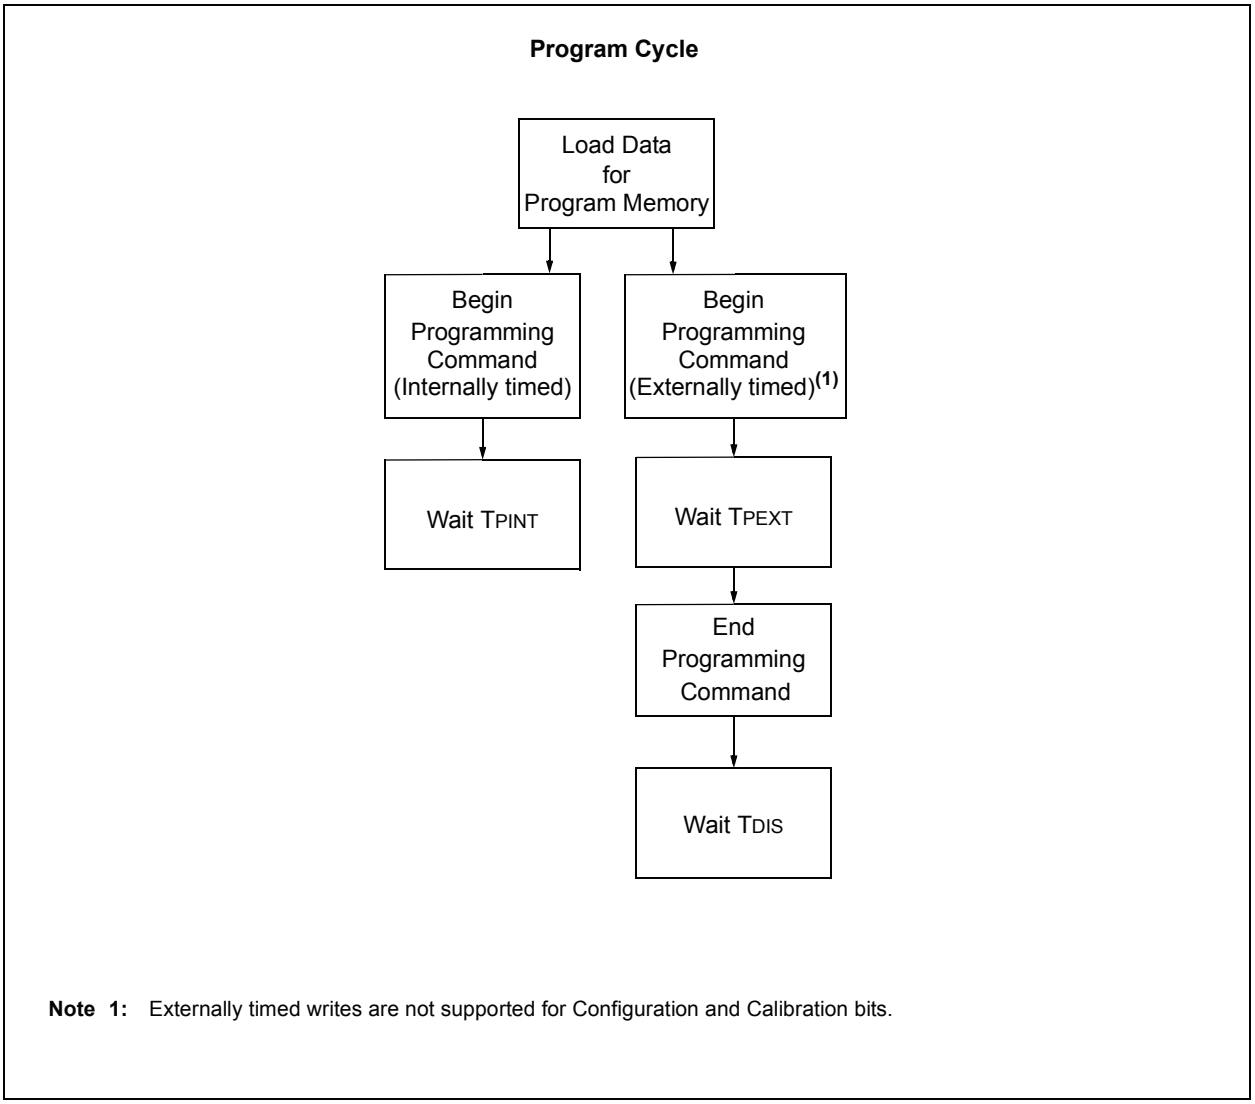
FIGURE 5-1: DEVICE PROGRAM/VERIFY FLOWCHART



Note 1: See Figure 5-2.

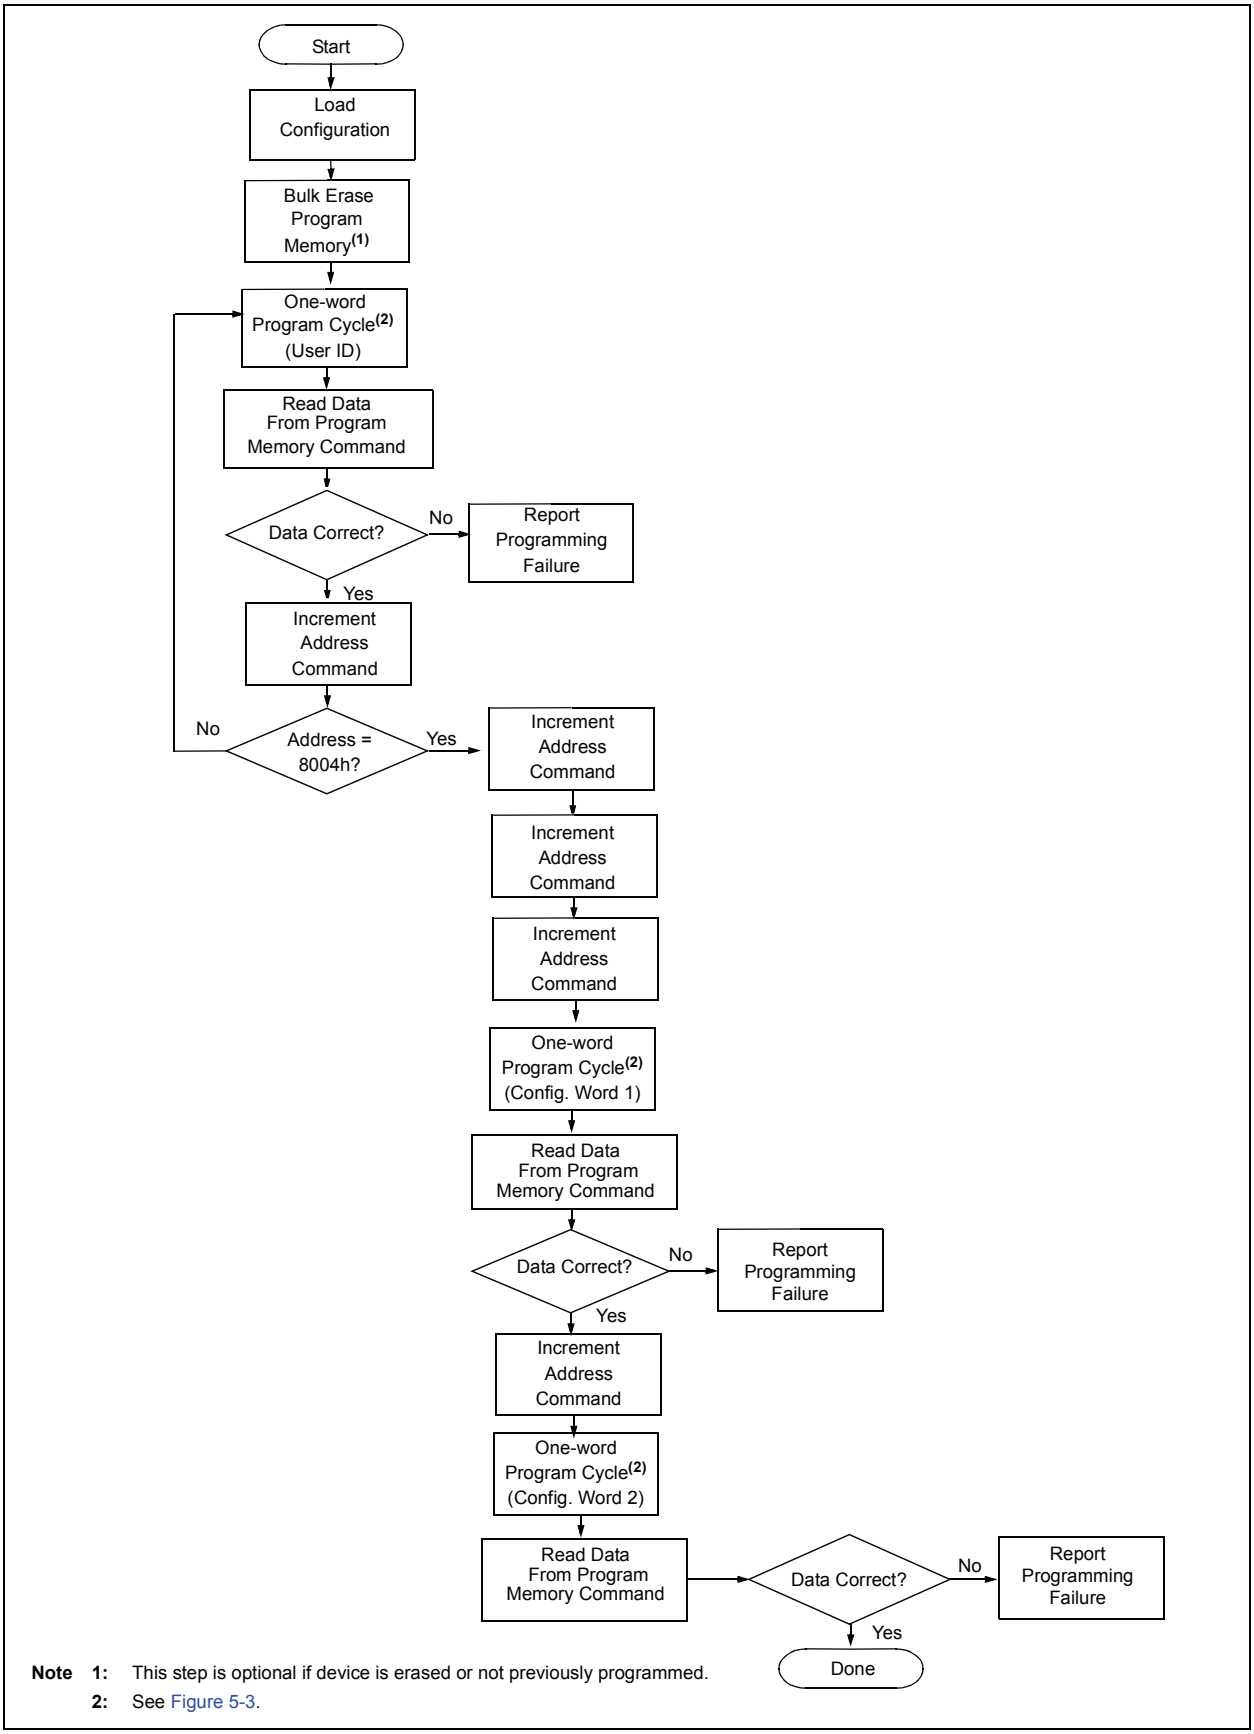
2: See Figure 5-5.

FIGURE 5-3: ONE-WORD PROGRAM CYCLE



Note 1: Externally timed writes are not supported for Configuration and Calibration bits.

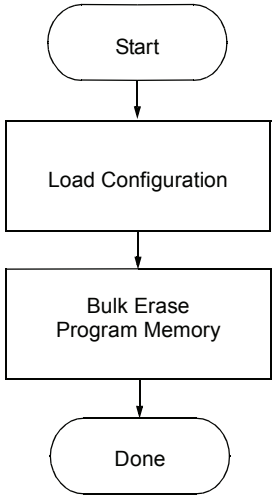
FIGURE 5-5: CONFIGURATION MEMORY PROGRAM FLOWCHART



Note 1: This step is optional if device is erased or not previously programmed.

2: See Figure 5-3.

FIGURE 5-6: ERASE FLOWCHART



Note: This sequence does not erase the Calibration Words.

6.0 CODE PROTECTION

Code protection is controlled using the $\overline{CP}$ bit in Configuration Word 1. When code protection is enabled, all program memory locations (0000h-7FFFh) read as all '0'. Further programming is disabled for the program memory (0000h-7FFFh).

The user ID locations and Configuration Words can be programmed and read out regardless of the code protection settings.

6.1 Program Memory

Code protection is enabled by programming the $\overline{CP}$ bit in Configuration Word 1 register to '0'.

The only way to disable code protection is to use the Bulk Erase Program Memory command.

7.0 HEX FILE USAGE

In the hex file there are two bytes per program word stored in the Intel® INHX32 hex format. Data is stored LSB first, MSB second. Because there are two bytes per word, the addresses in the hex file are 2x the address in program memory. (Example: Configuration Word 1 is stored at 8007h on the PIC16(L)F151X/152X. In the hex file this will be referenced as 1000Eh-1000Fh).

7.1 Configuration Word

To allow portability of code, it is strongly recommended that the programmer is able to read the Configuration Words and user ID locations from the hex file. If the Configuration Words information was not present in the hex file, a simple warning message may be issued. Similarly, while saving a hex file, Configuration Words and user ID information should be included.

7.2 Device ID and Revision

If a device ID is present in the hex file at 1000Ch-1000Dh (8006h on the part), the programmer should verify the device ID (excluding the revision) against the value read from the part. On a mismatch condition the programmer should generate a warning message.

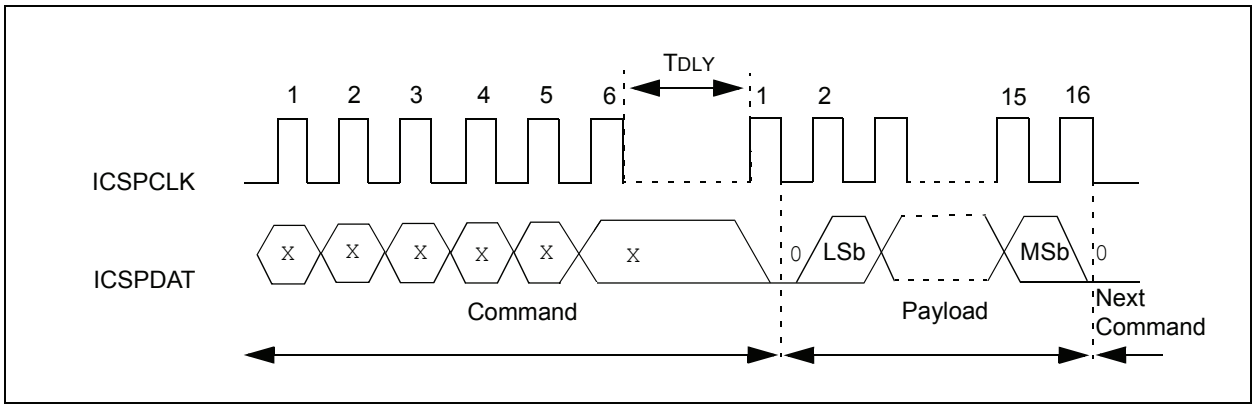

FIGURE 8-7: READ COMMAND-PAYLOAD TIMING

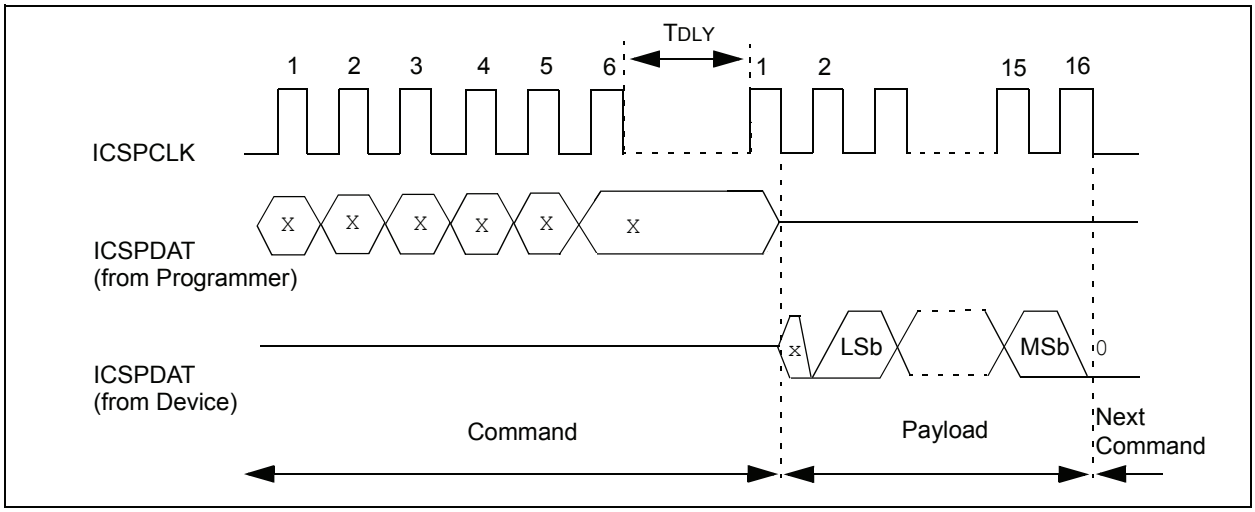

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
ISO/TS 16949:2009

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
