
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	20MHz
Connectivity	I²C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	25
Program Memory Size	28KB (16K x 14)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 5.5V
Data Converters	A/D 17x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16f1518t-i-so

2.0 DEVICE PINOUTS

The pin diagrams for the PIC16(L)F151X/152X family are shown in Figure 2-1 through Figure 2-7. The pins that are required for programming are listed in Table 1-1 and shown in bold lettering in the pin diagrams.

FIGURE 2-1: 28-PIN SPDIP, SOIC, SSOP DIAGRAM FOR PIC16(L)F1512, PIC16(L)F1513, PIC16(L)F1516 AND PIC16(L)F1518

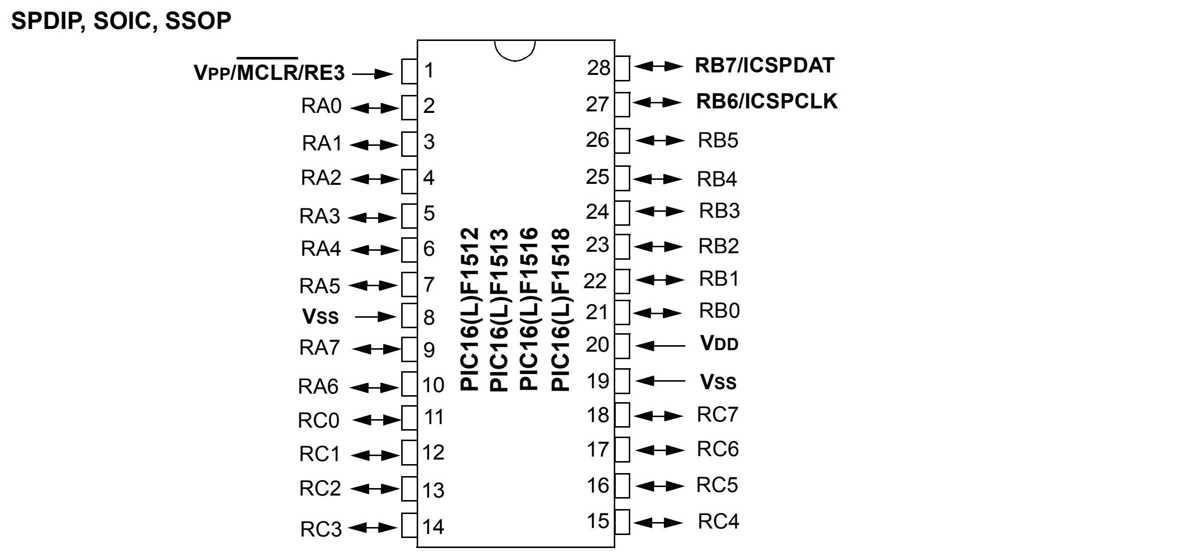

FIGURE 2-3: 40-PIN PDIP DIAGRAM FOR PIC16(L)F1517 AND PIC16(L)F1519

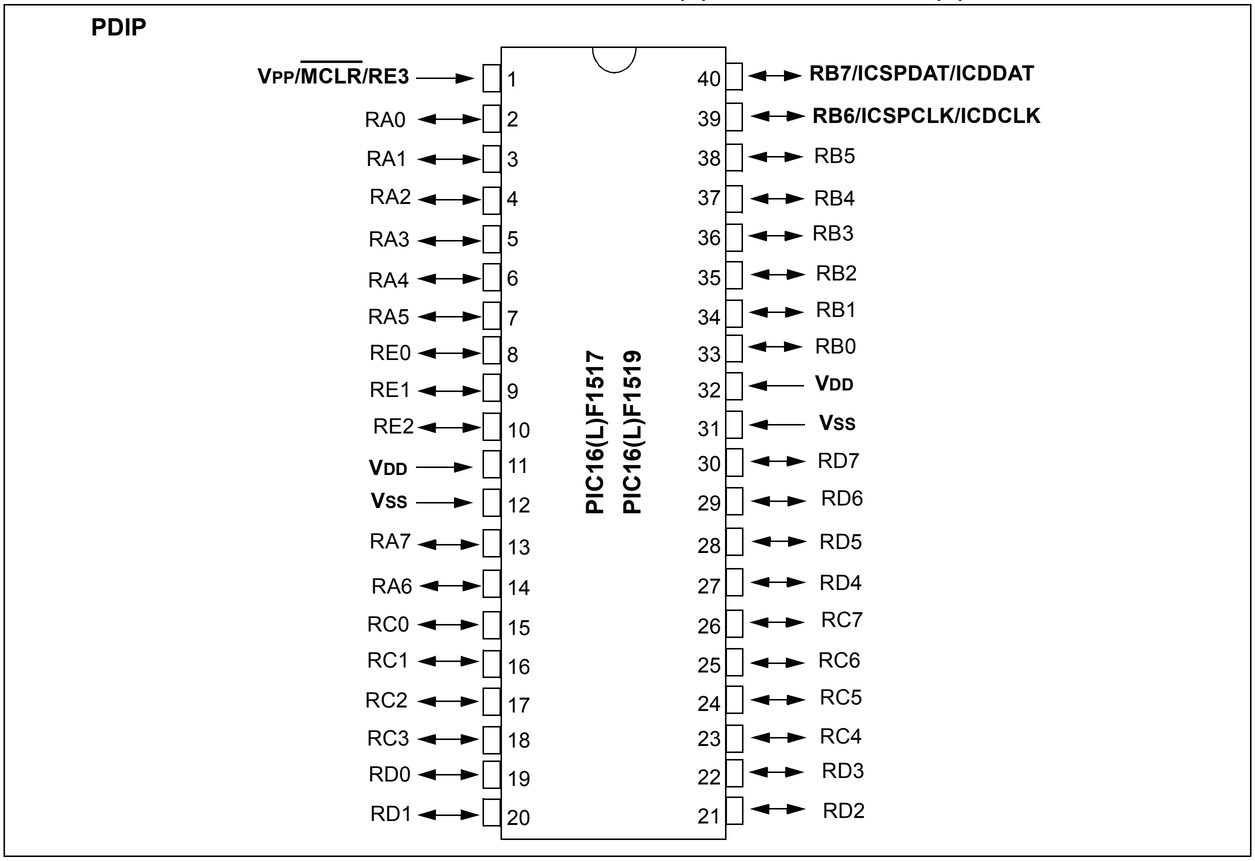

FIGURE 2-4: 40-PIN UQFN DIAGRAM FOR PIC16(L)F1517 AND PIC16(L)F1519

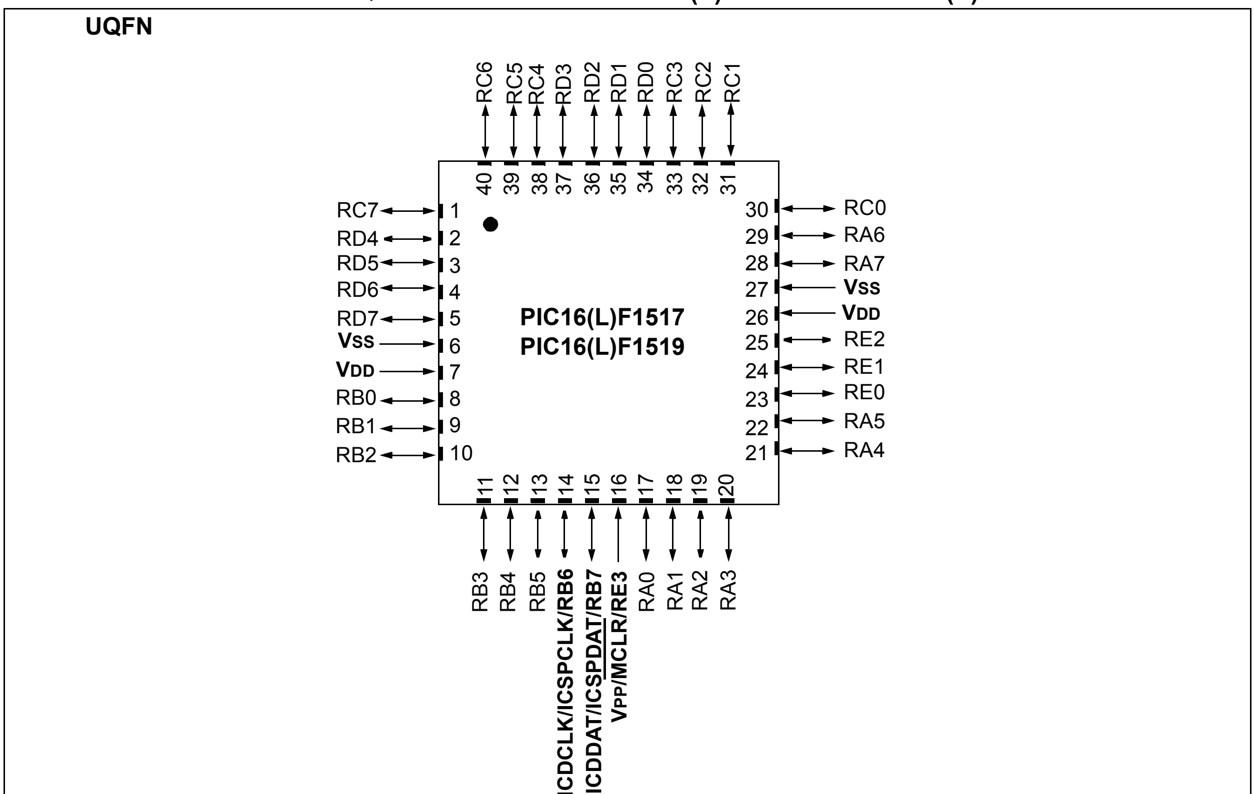

FIGURE 2-5: 44-PIN TQFP DIAGRAM FOR PIC16(L)F1517 AND PIC16(L)F1519

 Advance Information

FIGURE 2-6: 64-PIN QFN DIAGRAM FOR PIC16(L)F1526 AND PIC16(L)F1527

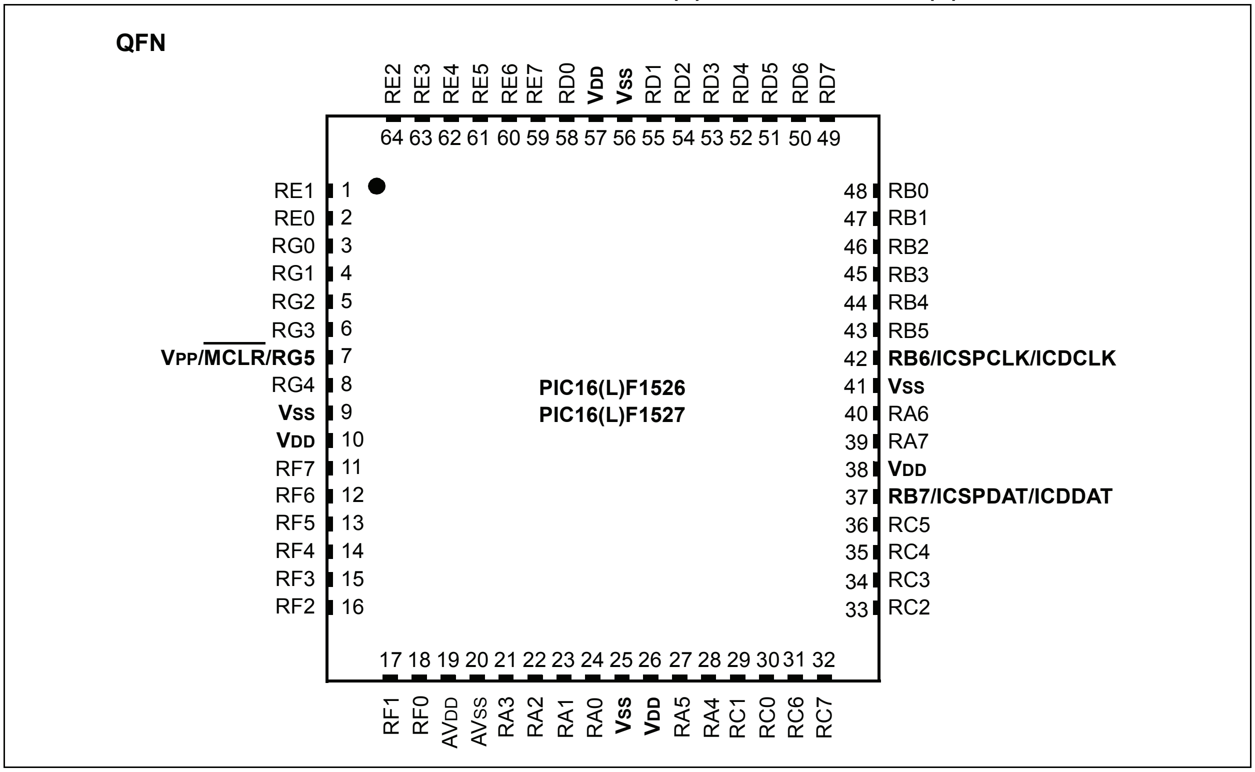

FIGURE 2-7: 64-PIN TQFP DIAGRAM FOR PIC16(L)F1526 AND PIC16(L)F1527

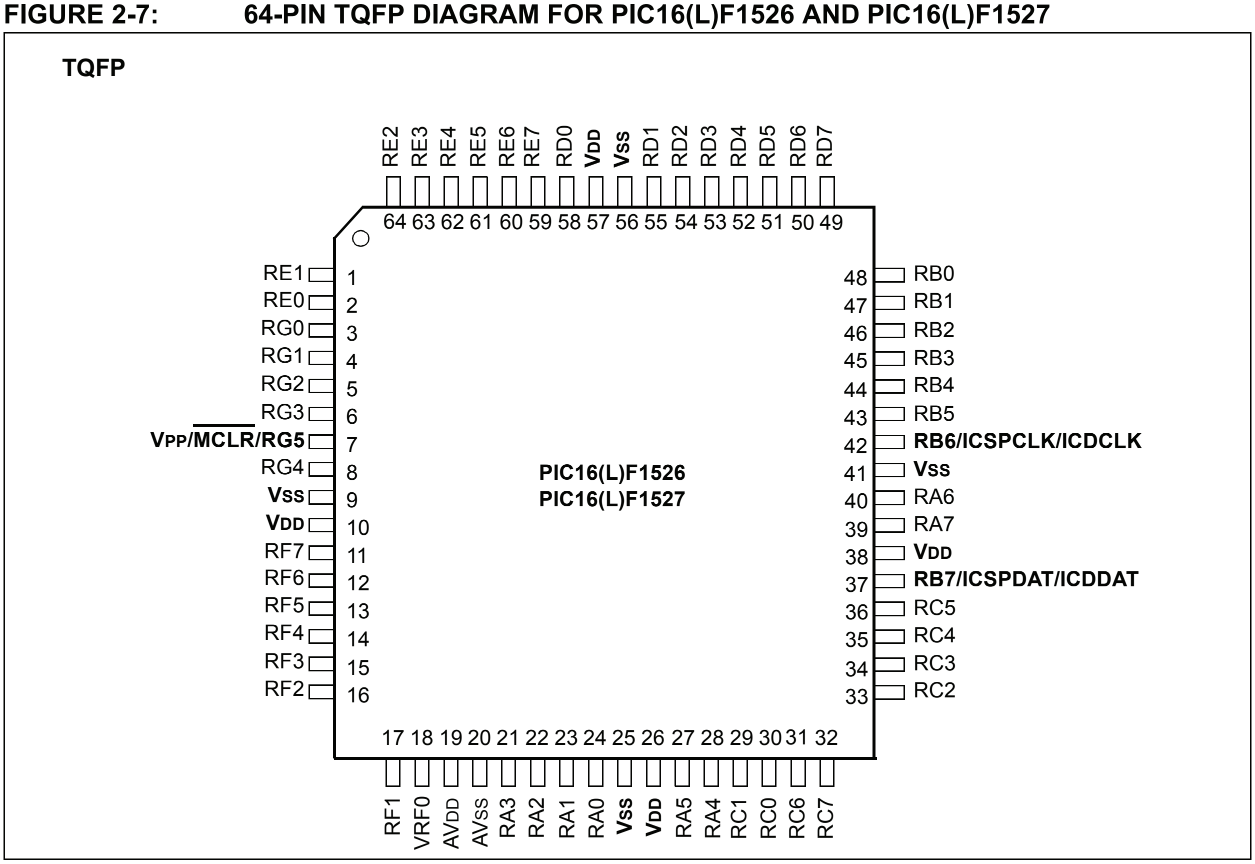

3.0 MEMORY MAP

The memory for the PIC16(L)F151X/152X devices is broken into two sections: program memory and configuration memory. Only the size of the program memory changes between devices, the configuration memory remains the same.

FIGURE 3-1: PIC16(L)F1512 PROGRAM MEMORY MAPPING

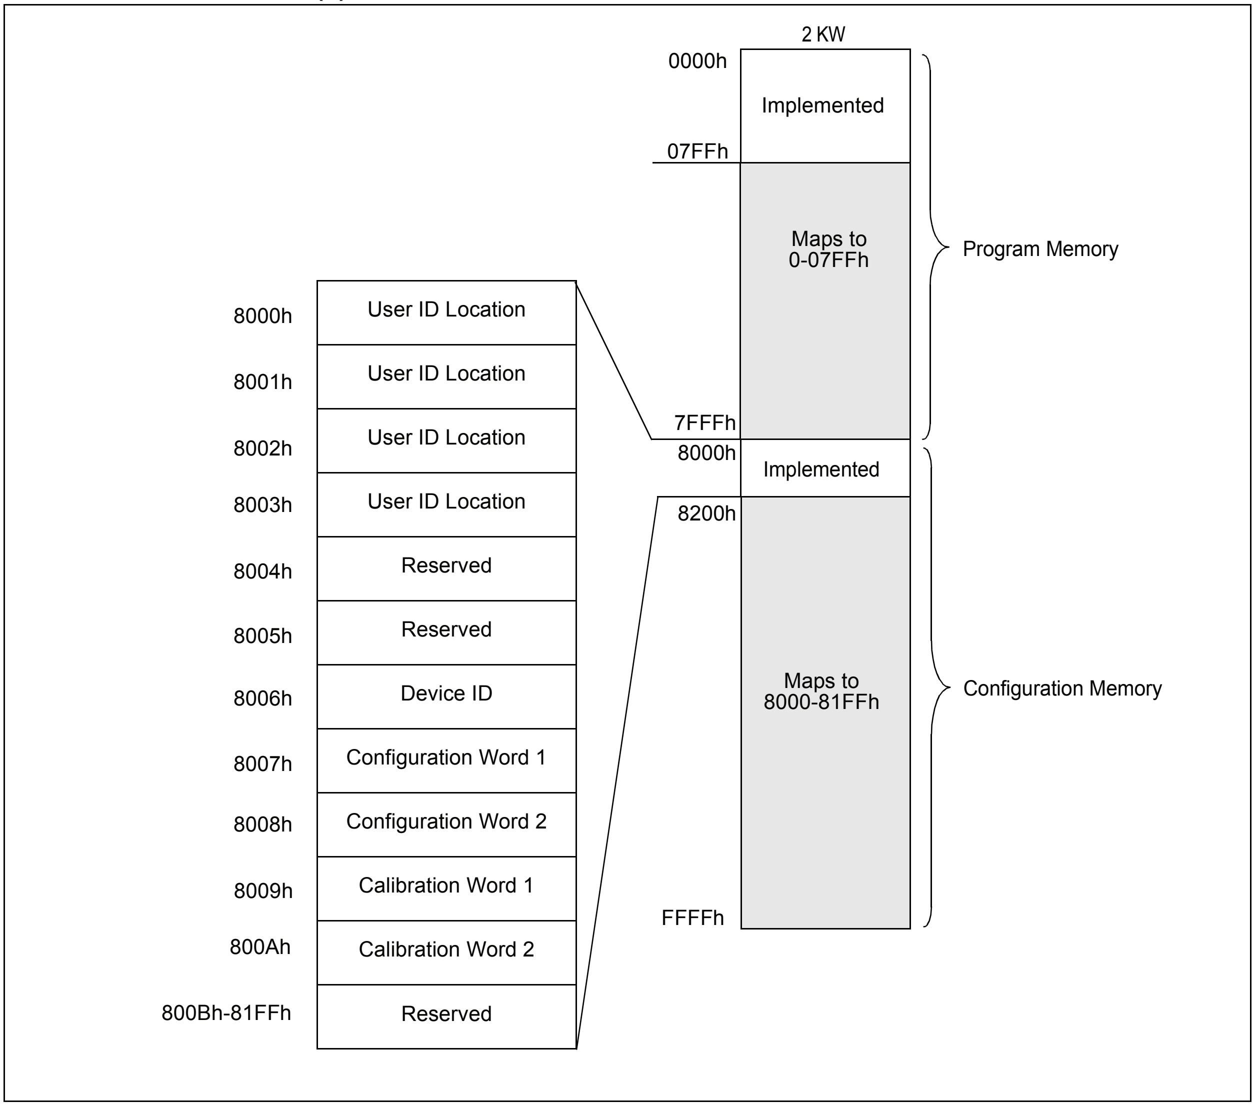

FIGURE 3-2: PIC16(L)F1513 PROGRAM MEMORY MAPPING

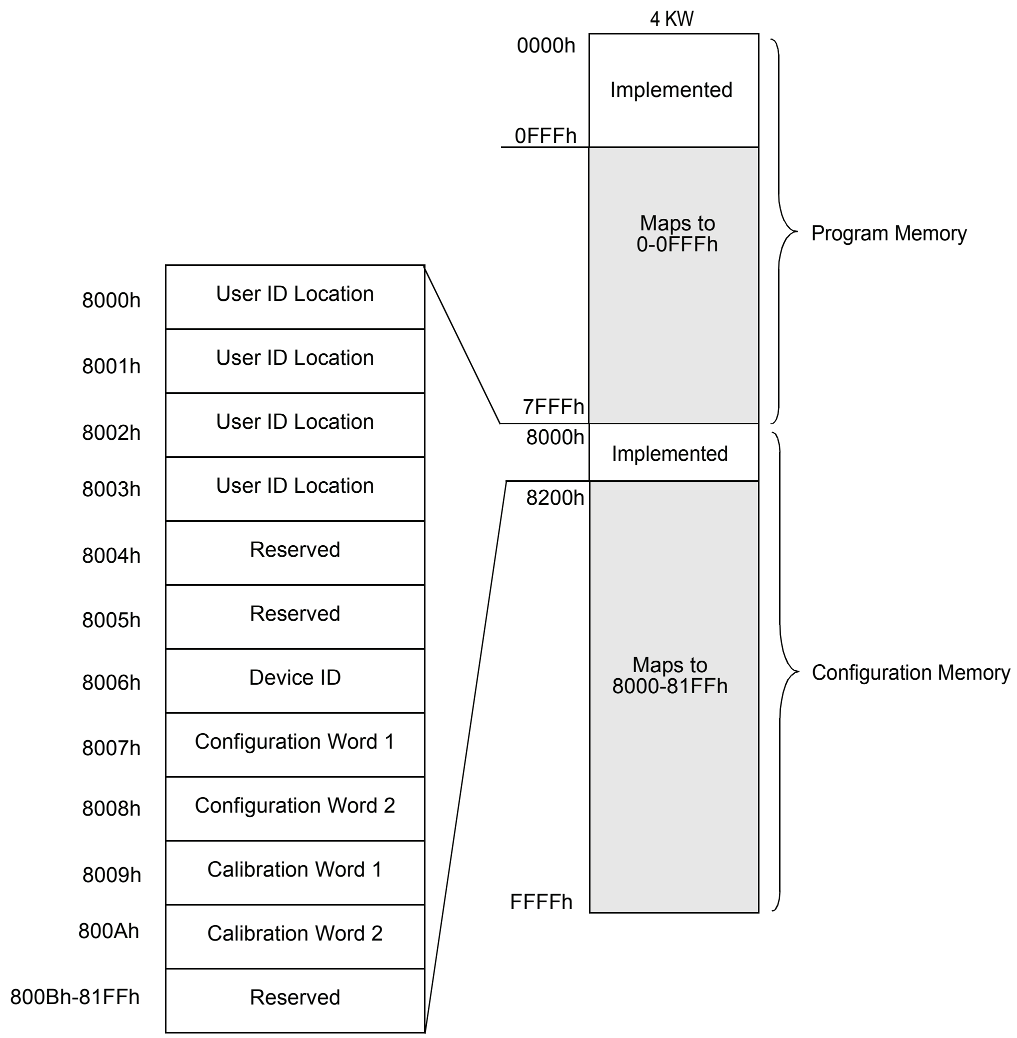

FIGURE 3-3: PIC16(L)F1526, PIC16(L)F1516 AND PIC16(L)F1517 PROGRAM MEMORY MAPPING

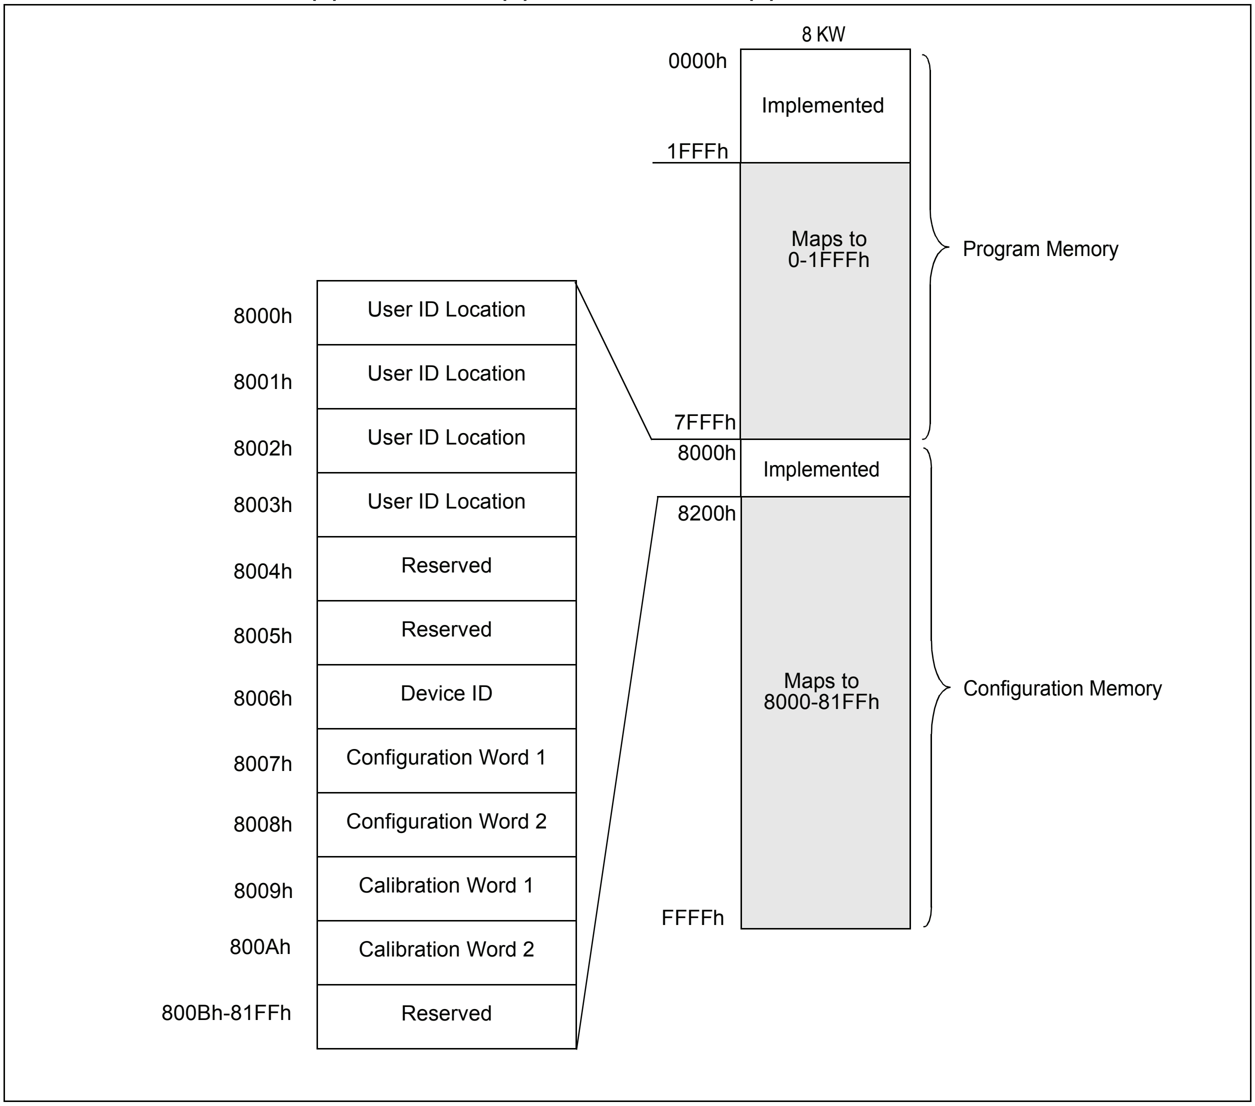


4.0 PROGRAM/VERIFY MODE

In Program/Verify mode, the program memory and the configuration memory can be accessed and programmed in serial fashion. ICSPDAT and ICSPCLK are used for the data and the clock, respectively. All commands and data words are transmitted LSb first. Data changes on the rising edge of the ICSPCLK and latched on the falling edge. In Program/Verify mode both the ICSPDAT and ICSPCLK are Schmitt Trigger inputs. The sequence that enters the device into Program/Verify mode places all other logic into the Reset state. Upon entering Program/Verify mode, all I/Os are automatically configured as high-impedance inputs and the address is cleared.

4.1 High-Voltage Program/Verify Mode Entry and Exit

There are two different methods of entering Program/ Verify mode via high-voltage:

- VPP – First entry mode
- VDD – First entry mode

4.1.1 VPP – FIRST ENTRY MODE

To enter Program/Verify mode via the VPP-first method the following sequence must be followed:

1. Hold ICSPCLK and ICSPDAT low. All other pins should be unpowered.
2. Raise the voltage on MCLR from 0V to VIHH.
3. Raise the voltage on VDD FROM 0V to the desired operating voltage.

The VPP-first entry prevents the device from executing code prior to entering Program/Verify mode. For example, when Configuration Word 1 has MCLR disabled (MCLRE = 0), the power-up time is disabled (PWRTE = 0), the internal oscillator is selected (FOSC = 100), and ICSPCLK and ICSPDAT pins are driven by the user application, the device will execute code. Since this may prevent entry, VPP-first entry mode is strongly recommended. See the timing diagram in Figure 8-2.

4.1.2 VDD – FIRST ENTRY MODE

To enter Program/Verify mode via the VDD-first method the following sequence must be followed:

1. Hold ICSPCLK and ICSPDAT low.
2. Raise the voltage on VDD from 0V to the desired operating voltage.
3. Raise the voltage on MCLR from VDD or below to VIHH.

The VDD-first method is useful when programming the device when VDD is already applied, for it is not necessary to disconnect VDD to enter Program/Verify mode. See the timing diagram in Figure 8-1.

4.1.3 PROGRAM/VERIFY MODE EXIT

To exit Program/Verify mode take MCLR to VDD or lower (VIL). See Figures 8-3 and 8-4.

4.2 Low-Voltage Programming (LVP) Mode

The Low-Voltage Programming mode allows the PIC16(L)F151X/152X devices to be programmed using VDD only, without high voltage. When the LVP bit of Configuration Word 2 register is set to '1', the low-voltage ICSP programming entry is enabled. To disable the Low-Voltage ICSP mode, the LVP bit must be programmed to '0'. This can only be done while in the High-Voltage Entry mode.

Entry into the Low-Voltage ICSP Program/Verify modes requires the following steps:

1. MCLR is brought to VIL.
2. A 32-bit key sequence is presented on ICSPDAT, while clocking ICSPCLK.

The key sequence is a specific 32-bit pattern, '0100 1101 0100 0011 0100 1000 0101 0000' (more easily remembered as MCHP in ASCII). The device will enter Program/Verify mode only if the sequence is valid. The Least Significant bit of the Least Significant nibble must be shifted in first.

Once the key sequence is complete, MCLR must be held at VIL for as long as Program/Verify mode is to be maintained.

For low-voltage programming timing, see Figure 8-8 and Figure 8-9.

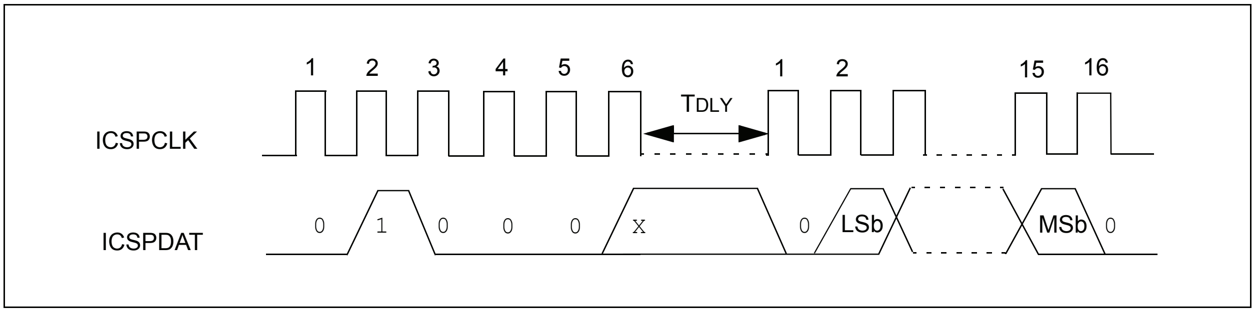
Exiting Program/Verify mode is done by no longer driving MCLR to VIL. See Figure 8-8 and Figure 8-9.

Note:	To enter LVP mode, the LSB of the Least Significant nibble must be shifted in first. This differs from entering the key sequence on other parts.

4.3.2 LOAD DATA FOR PROGRAM MEMORY

The Load Data for Program Memory command is used to load one 14-bit word into the data latches. The word programs into program memory after the Begin Internally Timed Programming or Begin Externally Timed Programming command is issued (see Figure 4-2).

FIGURE 4-2: LOAD DATA FOR PROGRAM MEMORY



4.3.3 READ DATA FROM PROGRAM MEMORY

The Read Data from Program Memory command will transmit data bits out of the program memory map currently accessed, starting with the second rising edge of the clock input. The ICSPDAT pin will go into Output mode on the first falling clock edge, and it will revert to Input mode (high-impedance) after the 16th falling edge of the clock. If the program memory is code-protected ($\overline{CP}$), the data will be read as zeros (see Figure 4-3).

FIGURE 4-3: READ DATA FROM PROGRAM MEMORY

 Advance Information

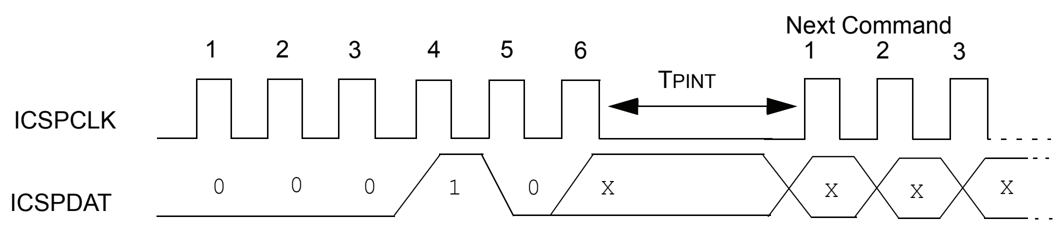
4.3.6 BEGIN INTERNALLY TIMED PROGRAMMING

A Load Configuration or Load Data for Program Memory command must be given before every Begin Programming command. Programming of the addressed memory will begin after this command is received. An internal timing mechanism executes the write. The user must allow for the program cycle time, TPINT, for the programming to complete.

The End Externally Timed Programming command is not needed when the Begin Internally Timed Programming is used to start the programming.

The program memory address that is being programmed is not erased prior to being programmed.

FIGURE 4-6: BEGIN INTERNALLY TIMED PROGRAMMING

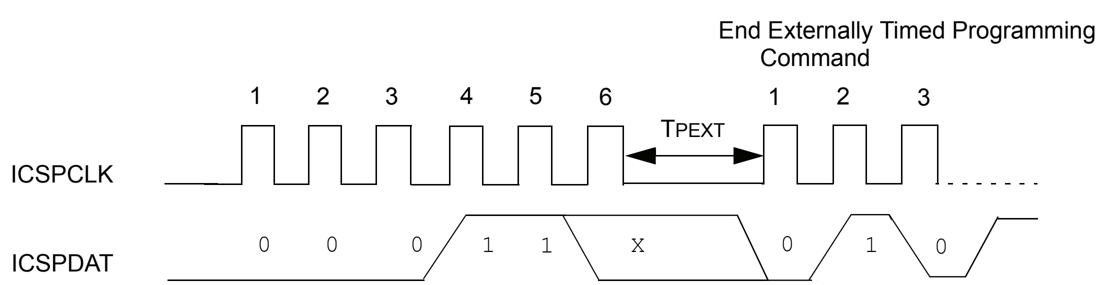


4.3.7 BEGIN EXTERNALLY TIMED PROGRAMMING

A Load Configuration or Load Data for Program Memory command must be given before every Begin Programming command. Programming of the addressed memory will begin after this command is received. To complete the programming the End Externally Timed Programming command must be sent in the specified time window defined by TPEXT (see Figure 4-7).

Externally timed writes are not supported for Configuration and Calibration bits. Any externally timed write to the Configuration or Calibration Word will have no effect on the targeted word.

FIGURE 4-7: BEGIN EXTERNALLY TIMED PROGRAMMING

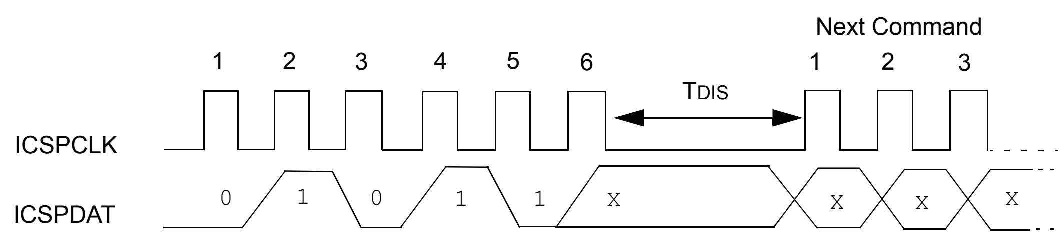


4.3.8 END EXTERNALLY TIMED PROGRAMMING

This command is required after a Begin Externally Timed Programming command is given. This command must be sent within the time window specified by TPEXT after the Begin Externally Timed Programming command is sent.

After sending the End Externally Timed Programming command, an additional delay (TDIS) is required before sending the next command. This delay is longer than the delay ordinarily required between other commands (see Figure 4-8).

FIGURE 4-8: END EXTERNALLY TIMED PROGRAMMING



4.3.9 BULK ERASE PROGRAM MEMORY

The Bulk Erase Program Memory command performs two different functions dependent on the current state of the address.

Address 0000h-7FFFh:

- Program Memory is erased
- Configuration Words are erased

Address 8000h-8008h:

- Program Memory is erased
- Configuration Words are erased
- User ID Locations are erased

A Bulk Erase Program Memory command should not be issued when the address is greater than 8008h.

After receiving the Bulk Erase Program Memory command the erase will not complete until the time interval, TERAB, has expired.

Note:	The code protection Configuration bit ($\overline{CP}$) has no effect on the Bulk Erase Program Memory command.

FIGURE 4-9: BULK ERASE PROGRAM MEMORY

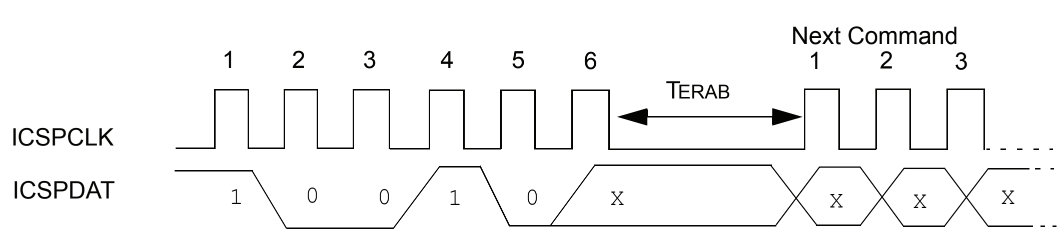


FIGURE 5-3: ONE-WORD PROGRAM CYCLE

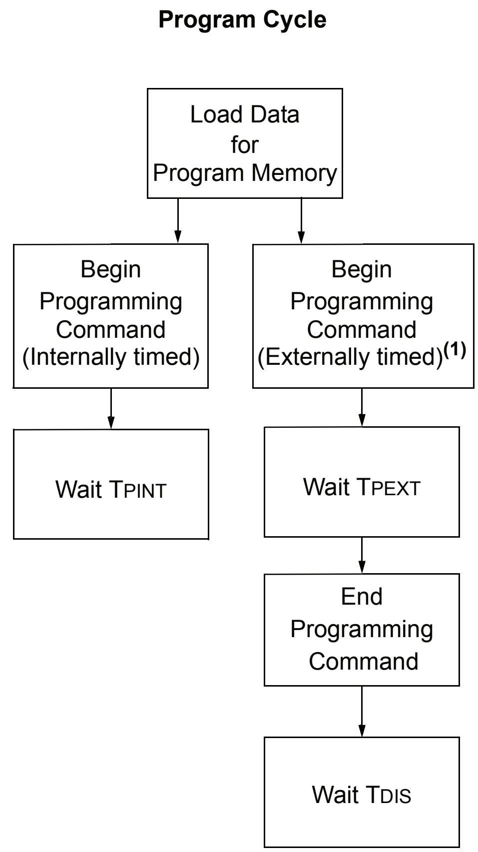
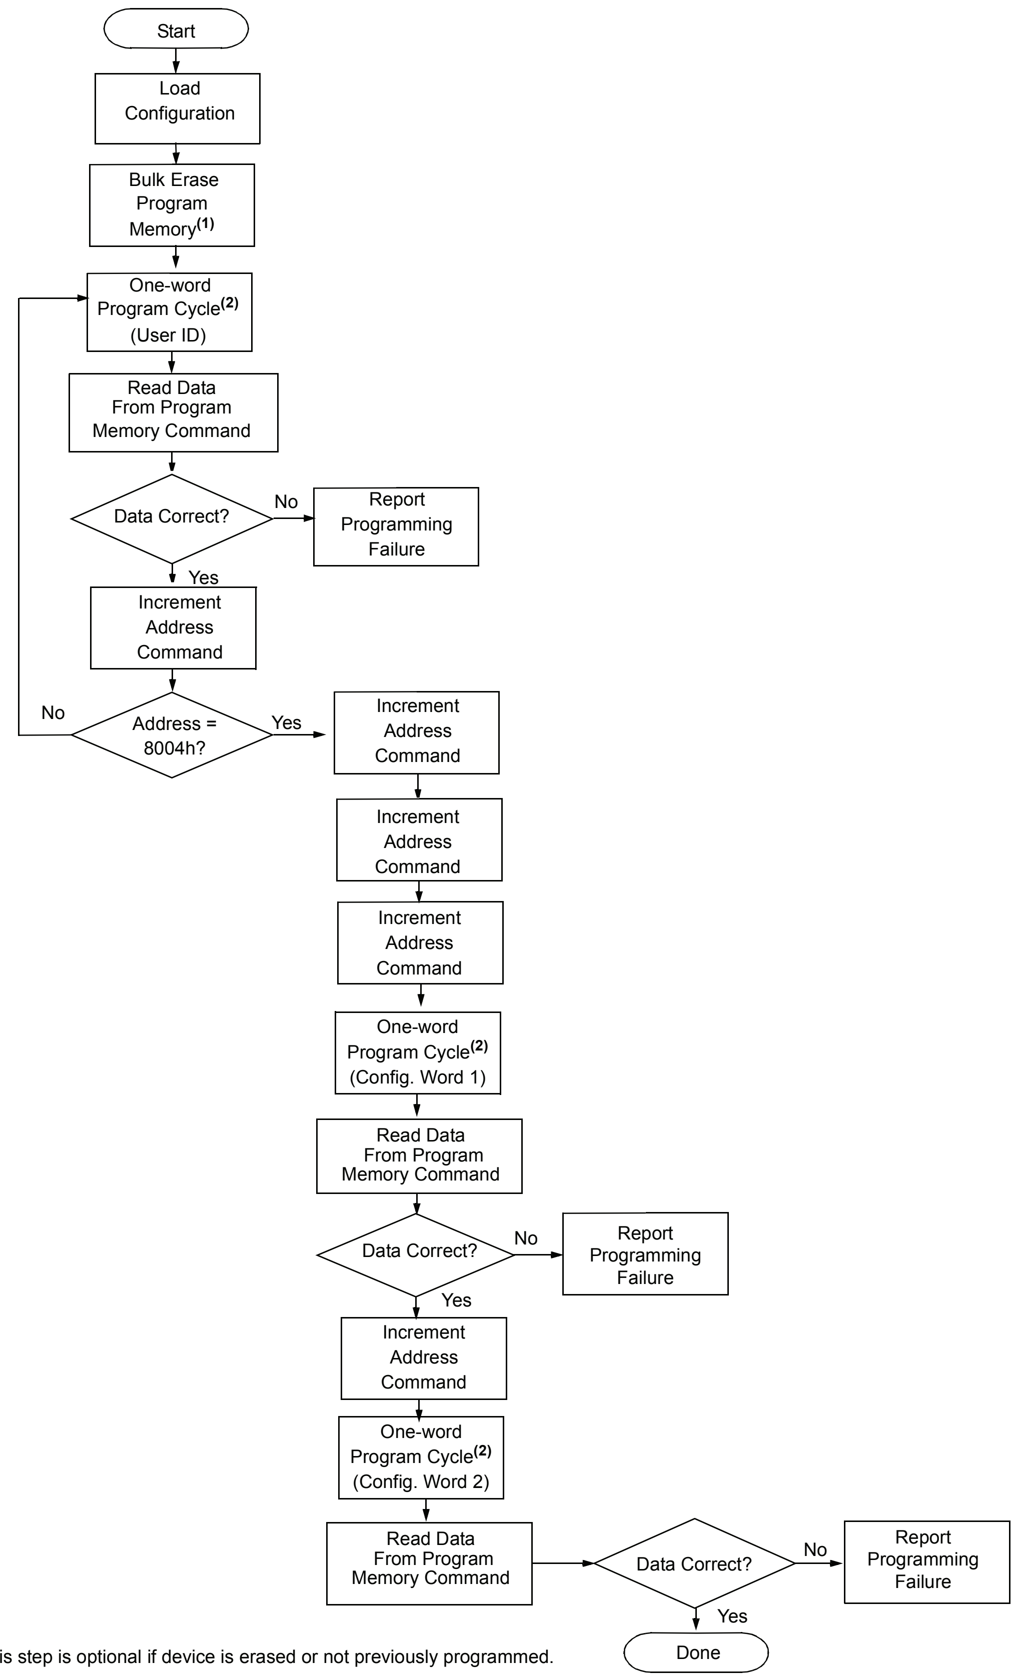


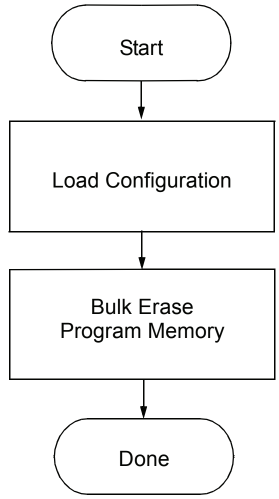
Note 1: Externally timed writes are not supported for Configuration and Calibration bits.

FIGURE 5-5: CONFIGURATION MEMORY PROGRAM FLOWCHART



Note 1: This step is optional if device is erased or not previously programmed.
2: See Figure 5-3.

FIGURE 5-6: ERASE FLOWCHART



Note: This sequence does not erase the Calibration Words.

6.0 CODE PROTECTION

Code protection is controlled using the $\overline{CP}$ bit in Configuration Word 1. When code protection is enabled, all program memory locations (0000h-7FFFh) read as all '0'. Further programming is disabled for the program memory (0000h-7FFFh).

The user ID locations and Configuration Words can be programmed and read out regardless of the code protection settings.

6.1 Program Memory

Code protection is enabled by programming the $\overline{CP}$ bit in Configuration Word 1 register to '0'.

The only way to disable code protection is to use the Bulk Erase Program Memory command.

7.0 HEX FILE USAGE

In the hex file there are two bytes per program word stored in the Intel® INHX32 hex format. Data is stored LSB first, MSB second. Because there are two bytes per word, the addresses in the hex file are 2x the address in program memory. (Example: Configuration Word 1 is stored at 8007h on the PIC16(L)F151X/152X. In the hex file this will be referenced as 1000Eh-1000Fh).

7.1 Configuration Word

To allow portability of code, it is strongly recommended that the programmer is able to read the Configuration Words and user ID locations from the hex file. If the Configuration Words information was not present in the hex file, a simple warning message may be issued. Similarly, while saving a hex file, Configuration Words and user ID information should be included.

7.2 Device ID and Revision

If a device ID is present in the hex file at 1000Ch-1000Dh (8006h on the part), the programmer should verify the device ID (excluding the revision) against the value read from the part. On a mismatch condition the programmer should generate a warning message.

EXAMPLE 7-1: CHECKSUM COMPUTED WITH PROGRAM CODE PROTECTION DISABLED PIC16F1527, BLANK DEVICE

PIC16F1527	Sum of Memory addresses 0000h-3FFFh(1)	C000h
	Configuration Word 1(2)	3FFFh
	Configuration Word 1 mask(3)	3EFFh
	Configuration Word 2(2)	3FFFh
	Configuration Word 2 mask(3)	3E13h
	Checksum	= C000h + (3FFFh and 3EFFh) + (3FFFh and 3E13h)
		= C000h + 3EFFh + 3E13h
		= 3D12h

Note 1: Sum of memory addresses = (Total number of program memory address locations) x (3FFFh) = C000h, truncated to 16 bits.

2: Configuration Word 1 and 2 = all bits are '1'; thus, code-protect is disabled.

3: Configuration Word 1 and 2 Mask = all bits are set to '1', except for unimplemented bits that are '0'.

EXAMPLE 7-2: CHECKSUM COMPUTED WITH PROGRAM CODE PROTECTION DISABLED PIC16LF1527, 00AAh AT FIRST AND LAST ADDRESS

PIC16LF1527	Sum of Memory addresses 0000h-3FFFh(1)	4156h
	Configuration Word 1(2)	3FFFh
	Configuration Word 1 mask(3)	3EFFh
	Configuration Word 2(2)	3FFFh
	Configuration Word 2 mask(4)	3E03h
	Checksum	= 4156h + (3FFFh and 3EFFh) + (3FFFh and 3E03h)
		= 4156h + 3EFFh + 3E03h
		= BE58h

Note 1: Total number of Program memory address locations: 3FFFh + 1 = 4000h. Then, 4000h - 2 = 3FFEh. Thus, [(3FFEh x 3FFFh) + (2 x 00AAh)] = 4156h, truncated to 16 bits.

2: Configuration Word 1 and 2 = all bits are '1'; thus, code-protect is disabled.

3: Configuration Word 1 Mask = all Configuration Word bits are set to '1', except for unimplemented bits that are '0'.

4: On the PIC16LF1527 device, the $\overline{\text{VCAPEN}}$ bit is not implemented in Configuration Word 2; Thus, all unimplemented bits are '0'.

8.0 ELECTRICAL SPECIFICATIONS

Refer to device specific data sheet for absolute maximum ratings.

TABLE 8-1: AC/DC CHARACTERISTICS TIMING REQUIREMENTS FOR PROGRAM/VERIFY MODE

AC/DC CHARACTERISTICS		**Standard Operating Conditions** Production tested at 25°C				
Sym.	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions/Comments**
	Supply Voltages and Currents					
VDD	Supply Voltage (VDDMIN, VDDMAX) — PIC16F151X, PIC16F152X	2.3	—	5.5	V	
	Supply Voltage (VDDMIN, VDDMAX) — PIC16LF151X, PIC16LF152X	1.8	—	3.6	V	
VPEW	Read/Write and Row Erase operations	VDDMIN	—	VDDMAX	V	
VPBE	Bulk Erase operations	2.7	—	VDDMAX	V	
IDDI	Current on VDD, Idle	—	—	1.0	mA	
IDDP	Current on VDD, Programming	—	—	3.0	mA	
	VPP					
IPP	Current on $\overline{MCLR}$/VPP	—	—	600	μA	
VIHH	High voltage on $\overline{MCLR}$/VPP for Program/Verify mode entry	8.0	—	9.0	V	
TVHHR	$\overline{MCLR}$ rise time (VIL to VIHH) for Program/Verify mode entry	—	—	1.0	μs	
	I/O pins					
VIH	(ICSPCLK, ICSPDAT, $\overline{MCLR}$/VPP) input high level	0.8 VDD	—	—	V	
VIL	(ICSPCLK, ICSPDAT, $\overline{MCLR}$/VPP) input low level	—	—	0.2 VDD	V	
VOH	ICSPDAT output high level	VDD-0.7 VDD-0.7 VDD-0.7	—	—	V	IOH = 3.5 mA, VDD = 5V IOH = 3 mA, VDD = 3.3V IOH = 2 mA, VDD = 1.8V
VOL	ICSPDAT output low level	—	—	VSS+0.6 VSS+0.6 VSS+0.6	V	IOH = 8 mA, VDD = 5V IOH = 6 mA, VDD = 3.3V IOH = 3 mA, VDD = 1.8V
	Programming Mode Entry and Exit					
TENTS	Programing mode entry setup time: ICSPCLK, ICSPDAT setup time before VDD or $\overline{MCLR}$↑	100	—	—	ns	
TENTH	Programing mode entry hold time: ICSPCLK, ICSPDAT hold time after VDD or $\overline{MCLR}$↑	250	—	—	μs	
	Serial Program/Verify					
TCKL	Clock Low Pulse Width	100	—	—	ns	
TCKH	Clock High Pulse Width	100	—	—	ns	
TDS	Data in setup time before clock↓	100	—	—	ns	
TDH	Data in hold time after clock↓	100	—	—	ns	
TCO	Clock↑ to data out valid (during a Read Data command)	0	—	80	ns	
TLZD	Clock↓ to data low-impedance (during a Read Data command)	0	—	80	ns	
THZD	Clock↓ to data high-impedance (during a Read Data command)	0	—	80	ns	
TDLY	Data input not driven to next clock input (delay required between command/data or command/ command)	1.0	—	—	μs	
TERAB	Bulk Erase cycle time	—	—	5	ms	
TERAR	Row Erase cycle time	—	—	2.5	ms	

Note 1: Externally timed writes are not supported for Configuration and Calibration bits.

FIGURE 8-8: LVP ENTRY (POWERED)

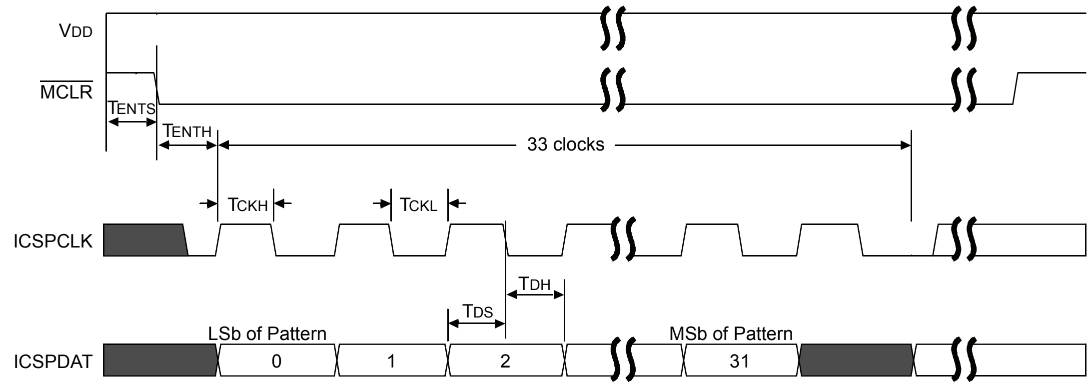


FIGURE 8-9: LVP ENTRY (POWERING UP)

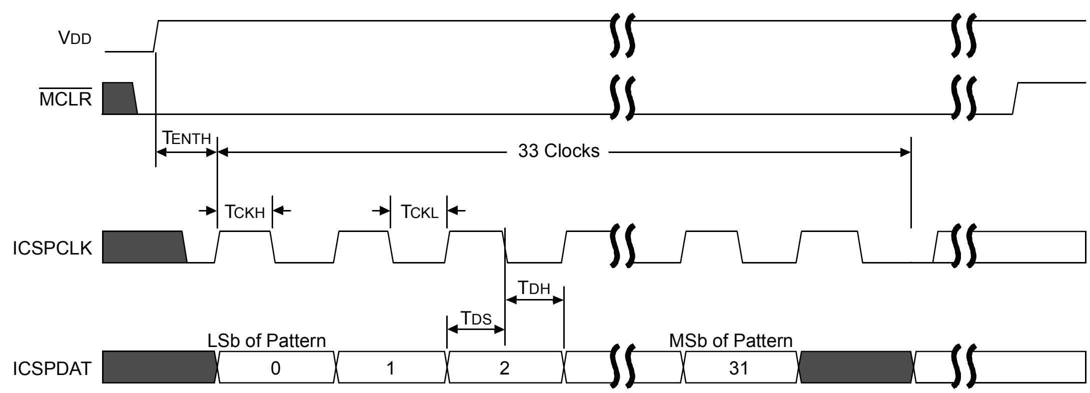

Note 1: Sequence matching can start with no edge on $\overline{\text{MCLR}}$ first.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
ISO/TS 16949:2009

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
