
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

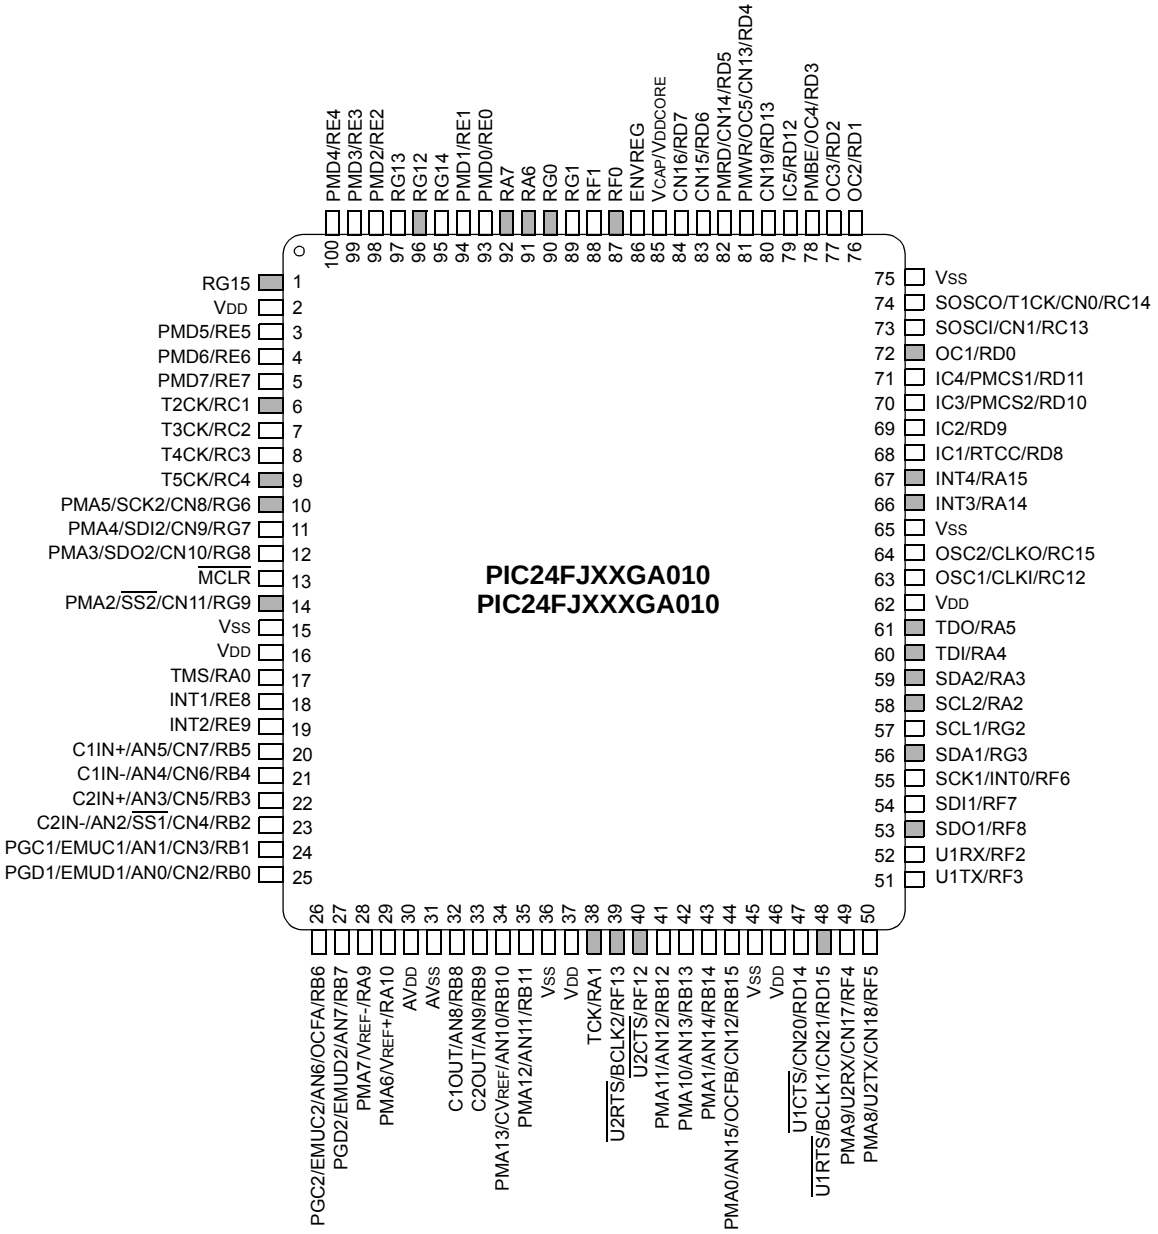
"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	16MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	84
Program Memory Size	96KB (32K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	8K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (12x12)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fj96ga010t-i-pt

Pin Diagrams (Continued))

100-Pin TQFP



Legend: Shaded pins indicate pins that are tolerant to up to +5.5 VDC.

TABLE 6-3: RESET DELAY TIMES FOR VARIOUS DEVICE RESETS

Reset Type	Clock Source	$\overline{\text{SYSRST}}$ Delay	System Clock Delay	FSCM Delay	Notes
POR	EC, FRC, FRCDIV, LPRC	TPOR + TSTARTUP + TRST	—	—	**1, 2, 3**
	ECPLL, FRCPLL	TPOR + TSTARTUP + TRST	TLOCK	TFSCM	**1, 2, 3, 5, 6**
	XT, HS, SOSC	TPOR + TSTARTUP + TRST	TOST	TFSCM	**1, 2, 3, 4, 6**
	XTPLL, HSPLL	TPOR + TSTARTUP + TRST	TOST + TLOCK	TFSCM	**1, 2, 3, 4, 5, 6**
BOR	EC, FRC, FRCDIV, LPRC	TSTARTUP + TRST	—	—	**2, 3**
	ECPLL, FRCPLL	TSTARTUP + TRST	TLOCK	TFSCM	**2, 3, 5, 6**
	XT, HS, SOSC	TSTARTUP + TRST	TOST	TFSCM	**2, 3, 4, 6**
	XTPLL, HSPLL	TSTARTUP + TRST	TOST + TLOCK	TFSCM	**2, 3, 4, 5, 6**
$\overline{\text{MCLR}}$	Any Clock	TRST	—	—	**3**
WDT	Any Clock	TRST	—	—	**3**
Software	Any Clock	TRST	—	—	**3**
Illegal Opcode	Any Clock	TRST	—	—	**3**
Uninitialized W	Any Clock	TRST	—	—	**3**
Trap Conflict	Any Clock	TRST	—	—	**3**

Note 1: TPOR = Power-on Reset delay (10 μs nominal).

2: TSTARTUP = TVREG (10 μs nominal) if the on-chip regulator is enabled or TPWRT (64 ms nominal) if an on-chip regulator is disabled.

3: TRST = Internal state Reset time (20 μs nominal).

4: TOST = Oscillator Start-up Timer. A 10-bit counter counts 1024 oscillator periods before releasing the oscillator clock to the system.

5: TLOCK = PLL lock time.

6: TFSCM = Fail-Safe Clock Monitor delay (100 μs nominal).

6.2.1 POR AND LONG OSCILLATOR START-UP TIMES

The oscillator start-up circuitry and its associated delay timers are not linked to the device Reset delays that occur at power-up. Some crystal circuits (especially low-frequency crystals) will have a relatively long start-up time. Therefore, one or more of the following conditions is possible after SYSRST is released:

- The oscillator circuit has not begun to oscillate.
- The Oscillator Start-up Timer has NOT expired (if a crystal oscillator is used).
- The PLL has not achieved a lock (if PLL is used).

The device will not begin to execute code until a valid clock source has been released to the system. Therefore, the oscillator and PLL start-up delays must be considered when the Reset delay time must be known.

6.2.2 FAIL-SAFE CLOCK MONITOR (FSCM) AND DEVICE RESETS

If the FSCM is enabled, it will begin to monitor the system clock source when SYSRST is released. If a valid clock source is not available at this time, the device will automatically switch to the FRC oscillator and the user can switch to the desired crystal oscillator in the Trap Service Routine.

6.2.2.1 FSCM Delay for Crystal and PLL Clock Sources

When the system clock source is provided by a crystal oscillator and/or the PLL, a small delay, TFSCM, will automatically be inserted after the POR and PWRT delay times. The FSCM will not begin to monitor the system clock source until this delay expires. The FSCM delay time is nominally 100 μs and provides additional time for the oscillator and/or PLL to stabilize. In most cases, the FSCM delay will prevent an oscillator failure trap at a device Reset when the PWRT is disabled.

6.3 Special Function Register Reset States

Most of the Special Function Registers (SFRs) associated with the PIC24F CPU and peripherals are reset to a particular value at a device Reset. The SFRs are grouped by their peripheral or CPU function and their Reset values are specified in each section of this manual.

The Reset value for each SFR does not depend on the type of Reset, with the exception of four registers. The Reset value for the Reset Control register, RCON, will depend on the type of device Reset. The Reset value for the Oscillator Control register, OSCCON, will depend on the type of Reset and the programmed values of the oscillator Configuration bits in the FOSC Device Configuration register (see Table 6-2). The RCFGCAL and NVMCON registers are only affected by a POR.

7.0 INTERRUPT CONTROLLER

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. Refer to **Section 8. "Interrupts"** (DS39707) in the *"PIC24F Family Reference Manual"* for more information.

The PIC24F interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the PIC24F CPU. It has the following features:

- Up to 8 processor exceptions and software traps
- 7 user-selectable priority levels
- Interrupt Vector Table (IVT) with up to 118 vectors
- A unique vector for each interrupt or exception source
- Fixed priority within a specified user priority level
- Alternate Interrupt Vector Table (AIVT) for debug support
- Fixed interrupt entry and return latencies

7.1 Interrupt Vector Table

The Interrupt Vector Table (IVT) is shown in Figure 7-1. The IVT resides in program memory, starting at location, 000004h. The IVT contains 126 vectors, consisting of 8 non-maskable trap vectors, plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority; this is linked to their position in the vector table. All other things being equal, lower addresses have a higher natural priority. For example, the interrupt associated with Vector 0 will take priority over interrupts at any other vector address.

PIC24FJ128GA010 family devices implement non-maskable traps and unique interrupts. These are summarized in Table 7-1 and Table 7-2.

7.1.1 ALTERNATE INTERRUPT VECTOR TABLE

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in Figure 7-1. Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes will use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

The AIVT supports emulation and debugging efforts by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

7.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The PIC24F device clears its registers in response to a Reset which forces the PC to zero. The microcontroller then begins program execution at location, 000000h. The user programs a GOTO instruction at the Reset address, which redirects program execution to the appropriate start-up routine.

Note: Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

To set up the SPI module for the Enhanced Buffer Master mode of operation:

1. If using interrupts:
   a) Clear the SPIxIF bit in the respective IFSx register.
   b) Set the SPIxIE bit in the respective IECx register.
   c) Write the SPIxIP bits in the respective IPCx register.
2. Write the desired settings to the SPIxCON1 and SPIxCON2 registers with MSTEN (SPIxCON1<5>) = 1.
3. Clear the SPIROV bit (SPIxSTAT<6>).
4. Select Enhanced Buffer mode by setting the SPIBEN bit (SPIxCON2<0>).
5. Enable SPI operation by setting the SPIEN bit (SPIxSTAT<15>).
6. Write the data to be transmitted to the SPIxBUF register. Transmission (and reception) will start as soon as data is written to the SPIxBUF register.

To set up the SPI module for the Enhanced Buffer Slave mode of operation:

1. Clear the SPIxBUF register.
2. If using interrupts:
   - Clear the SPIxIF bit in the respective IFSx register.
   - Set the SPIxIE bit in the respective IECx register.
   - Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1 and SPIxCON2 registers with MSTEN (SPIxCON1<5>) = 0.
4. Clear the SMP bit.
5. If the CKE bit is set, then the SSEN bit must be set, thus enabling the $\overline{SSx}$ pin.
6. Clear the SPIROV bit (SPIxSTAT<6>).
7. Select Enhanced Buffer mode by setting the SPIBEN bit (SPIxCON2<0>).
8. Enable SPI operation by setting the SPIEN bit (SPIxSTAT<15>).

0 = Enhanced Buffer is disabled (Legacy mode)

17.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. Refer to **Section 21. "UART"** (DS39708) in the *"PIC24F Family Reference Manual"* for more information.

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the PIC24F device family. The UARTx is a full-duplex, asynchronous system that can communicate with peripheral devices, such as personal computers, LIN/J2602, RS-232 and RS-485 interfaces. The module also supports a hardware flow control option with the $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins, and also includes an IrDA® encoder and decoder.

The primary features of the UARTx module are:

- Full-Duplex, 8 or 9-Bit Data Transmission Through the UxTX and UxRX Pins
- Even, Odd or No Parity Options (for 8-bit data)
- One or Two Stop bits
- Hardware Flow Control Option with $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ Pins
- Fully Integrated Baud Rate Generator with 16-Bit Prescaler
- Baud Rates Ranging from 1 Mbps to 15 bps at 16 MIPS
- 4-Deep First-In-First-Out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, Framing and Buffer Overrun Error Detection
- Support for 9-bit mode with Address Detect (9th bit = 1)
- Transmit and Receive Interrupts
- Loopback mode for Diagnostic Support
- Support for Sync and Break Characters
- Supports Automatic Baud Rate Detection
- IrDA Encoder and Decoder Logic
- 16x Baud Clock Output for IrDA Support

A simplified block diagram of the UARTx is shown in Figure 17-1. The UARTx module consists of these key important hardware elements:

- Baud Rate Generator
- Asynchronous Transmitter
- Asynchronous Receiver

0 = Comparator is disabled

bit 9 **C2OUTEN:** Comparator 2 Output Enable bit
1 = Comparator output is driven on the output pad
0 = Comparator output is not driven on the output pad

bit 8 **C1OUTEN:** Comparator 1 Output Enable bit
1 = Comparator output is driven on the output pad
0 = Comparator output is not driven on the output pad

bit 7 **C2OUT:** Comparator 2 Output bit
When C2INV = 0:
1 = C2 VIN+ > C2 VIN-
0 = C2 VIN+ < C2 VIN-
When C2INV = 1:
0 = C2 VIN+ > C2 VIN-
1 = C2 VIN+ < C2 VIN-

bit 6 **C1OUT:** Comparator 1 Output bit
When C1INV = 0:
1 = C1 VIN+ > C1 VIN-
0 = C1 VIN+ < C1 VIN-
When C1INV = 1:
0 = C1 VIN+ > C1 VIN-
1 = C1 VIN+ < C1 VIN-

24.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. Refer to **Section 32. "High-Level Device Integration"** (DS39719) in the *"PIC24F Family Reference Manual"* for more information.

PIC24FJ128GA010 devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection
- JTAG Boundary Scan Interface
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation

24.1 Configuration Bits

The Configuration bits can be programmed (read as '0') or left unprogrammed (read as '1') to select various device configurations. These bits are mapped, starting at program memory location, F80000h. A complete list is shown in Table 24-1. A detailed explanation of the various bit functions is provided in Register 24-1 through Register 24-4.

Note that address, F80000h, is beyond the user program memory space. In fact, it belongs to the configuration memory space (800000h-FFFFFFh), which can only be accessed using table reads and table writes.

24.1.1 CONSIDERATIONS FOR CONFIGURING PIC24FJ128GA010 FAMILY DEVICES

In PIC24FJ128GA010 family devices, the configuration bytes are implemented as volatile memory. This means that configuration data must be programmed each time the device is powered up. Configuration data is stored in the two words at the top of the on-chip program memory space, known as the Flash Configuration Words. Their specific locations are shown in Table 24-1. These are packed representations of the actual device Configuration bits, whose actual locations are distributed among five locations in configuration space. The configuration data is automatically loaded from the Flash Configuration Words to the proper Configuration registers during device Resets.

Note: Configuration data is reloaded on all types of device Resets.

TABLE 24-1: FLASH CONFIGURATION WORD LOCATIONS

Device	Configuration Word Addresses	
	1	2
PIC24FJ64GA	00ABFEh	00ABFCh
PIC24FJ96GA	00FFFEh	00FFFCh
PIC24FJ128GA	0157FEh	0157FCh

When creating applications for these devices, users should always specifically allocate the location of the Flash Configuration Word for configuration data. This is to make certain that program code is not stored in this address when the code is compiled.

The Configuration bits are reloaded from the Flash Configuration Word on any device Reset.

The upper byte of both Flash Configuration Words in program memory should always be '1111 1111'. This makes them appear to be NOP instructions in the remote event that their locations are ever executed by accident. Since Configuration bits are not implemented in the corresponding locations, writing '1's to these locations has no effect on device operation.

REGISTER 24-1: FLASH CONFIGURATION WORD 1

U-1	U-1	U-1	U-1	U-1	U-1	U-1	U-1
—	—	—	—	—	—	—	—
bit 23							bit 16

r-x	R/PO-1	R/PO-1	R/PO-1	R/PO-1	r-1	U-1	R/PO-1
r	JTAGEN(1)	GCP	GWRP	$\overline{\text{DEBUG}}$	r	—	ICS
bit 15							bit 8

R/PO-1	R/PO-1	U-1	R/PO-1	R/PO-1	R/PO-1	R/PO-1	R/PO-1
FWDTEN	WINDIS	—	FWPSA	WDTPS3	WDTPS2	WDTPS1	WDTPS0
bit 7							bit 0

Legend:	x = Bit is unknown	r = Reserved	
R = Readable bit	PO = Program Once bit	U = Unimplemented bit, read as '0'	
-n = Value when device is unprogrammed		'1' = Bit is set	'0' = Bit is cleared

bit 23-16 **Unimplemented:** Read as '1'

bit 15 **Reserved:** Program as '0'. Read value is unknown.

bit 14 **JTAGEN:** JTAG Port Enable bit(1)
- 1 = JTAG port is enabled
- 0 = JTAG port is disabled

bit 13 **GCP:** General Segment Program Memory Code Protection bit
- 1 = Code protection is disabled
- 0 = Code protection is enabled for the entire program memory space

bit 12 **GWRP:** General Segment Code Flash Write Protection bit
- 1 = Writes to program memory are allowed
- 0 = Writes to program memory are disabled

bit 11 **$\overline{\text{DEBUG}}$:** Background Debugger Enable bit
- 1 = Device resets into Operational mode
- 0 = Device resets into Debug mode

bit 10 **Reserved:** Program as '1'

bit 9 **Unimplemented:** Read as '1'

bit 8 **ICS:** Emulator Pin Placement Select bit
- 1 = Emulator/debugger uses EMUC2/EMUD2
- 0 = Emulator/debugger uses EMUC1/EMUD1

bit 7 **FWDTEN:** Watchdog Timer Enable bit
- 1 = Watchdog Timer is enabled
- 0 = Watchdog Timer is disabled

bit 6 **WINDIS:** Windowed Watchdog Timer Disable bit
- 1 = Standard Watchdog Timer is enabled
- 0 = Windowed Watchdog Timer is enabled; FWDTEN must be '1'

bit 5 **Unimplemented:** Read as '1'

bit 4 **FWPSA:** WDT Prescaler Ratio Select bit
- 1 = Prescaler ratio of 1:128
- 0 = Prescaler ratio of 1:32

Note 1: JTAGEN bit can not be modified using JTAG programming. It can only change using In-Circuit Serial Programming™ (ICSP™).

24.2 On-Chip Voltage Regulator

All of the PIC24FJ128GA010 family devices power their core digital logic at a nominal 2.5V. This may create an issue for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the PIC24FJ128GA010 family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

The regulator is controlled by the ENVREG pin. Tying VDD to the pin enables the regulator, which in turn, provides power to the core from the other VDD pins. When the regulator is enabled, a low-ESR capacitor (such as tantalum) must be connected to the VDDCORE/VCAP pin (Figure 24-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor, CEFC, is provided in **Section 27.1 "DC Characteristics"**.

If ENVREG is tied to VSS, the regulator is disabled. In this case, separate power for the core logic, at a nominal 2.5V, must be supplied to the device on the VDDCORE/VCAP pin to run the I/O pins at higher voltage levels, typically 3.3V. Alternatively, the VDDCORE/VCAP and VDD pins can be tied together to operate at a lower nominal voltage. Refer to Figure 24-1 for possible configurations.

24.2.1 ON-CHIP REGULATOR AND POR

When the voltage regulator is enabled, it takes approximately 20 μs for it to generate output. During this time, designated as TSTARTUP, code execution is disabled. TSTARTUP is applied every time the device resumes operation after any power-down, including Sleep mode.

If the regulator is disabled, a separate Power-up Timer (PWRT) is automatically enabled. The PWRT adds a fixed delay of 64 ms nominal delay at device start-up.

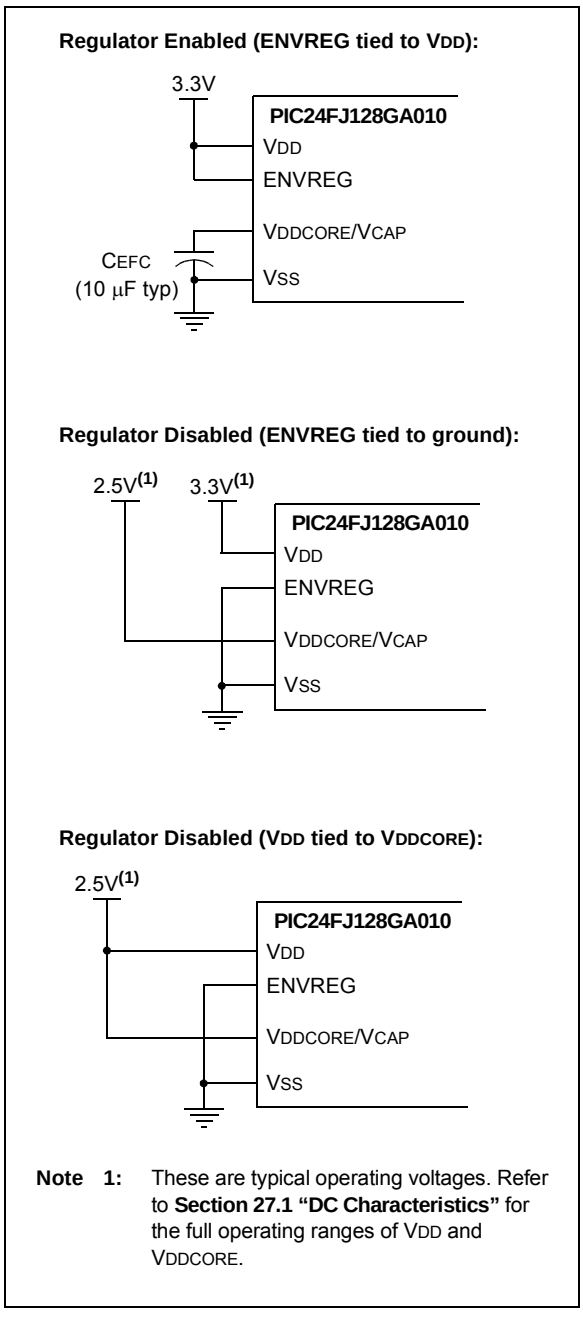
24.2.2 ON-CHIP REGULATOR AND BOR

When the on-chip regulator is enabled, PIC24FJ128GA010 devices also have a simple brown-out capability. If the voltage supplied to the regulator is inadequate to maintain a regulated level, the regulator Reset circuitry will generate a Brown-out Reset. This event is captured by the BOR flag bit (RCON<0>). The brown-out voltage specifications can be found in the *"PIC24F Family Reference Manual"* in **Section 7. "Reset"** (DS39712).

24.2.3 POWER-UP REQUIREMENTS

The on-chip regulator is designed to meet the power-up requirements for the device. If the application does not use the regulator, then strict power-up conditions must be adhered to. While powering up, VDDCORE must never exceed VDD by 0.3 volts.

FIGURE 24-1: CONNECTIONS FOR THE ON-CHIP REGULATOR



Note 1: These are typical operating voltages. Refer to **Section 27.1 "DC Characteristics"** for the full operating ranges of VDD and VDDCORE.

TABLE 27-5: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial			
Parameter No.	**Typical(1)**	**Max**	**Units**	**Conditions**		
Operating Current (IDD)(2)						
DC20	1.6	4.0	mA	-40°C	2.5V(3)	1 MIPS
DC20a	1.6	4.0	mA	+25°C		
DC20b	1.6	4.0	mA	+85°C		
DC20d	1.6	4.0	mA	-40°C	3.6V(4)	
DC20e	1.6	4.0	mA	+25°C		
DC20f	1.6	4.0	mA	+85°C		
DC23	6.0	12	mA	-40°C	2.5V(3)	4 MIPS
DC23a	6.0	12	mA	+25°C		
DC23b	6.0	12	mA	+85°C		
DC23d	6.0	12	mA	-40°C	3.6V(4)	
DC23e	6.0	12	mA	+25°C		
DC23f	6.0	12	mA	+85°C		
DC24	20	32	mA	-40°C	2.5V(3)	16 MIPS
DC24a	20	32	mA	+25°C		
DC24b	20	32	mA	+85°C		
DC24d	20	32	mA	-40°C	3.6V(4)	
DC24e	20	32	mA	+25°C		
DC24f	20	32	mA	+85°C		
DC31	70	150	μA	-40°C	2.5V(3)	LPRC (31 kHz)
DC31a	100	200	μA	+25°C		
DC31b	200	400	μA	+85°C		
DC31d	70	150	μA	-40°C	3.6V(4)	
DC31e	100	200	μA	+25°C		
DC31f	200	400	μA	+85°C		

Note 1: Data in "Typical" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDD measurements are as follows: OSC1 driven with external square wave from rail-to-rail. All I/O pins are configured as inputs and pulled to VDD. $\overline{MCLR}$ = VDD; WDT and FSCM are disabled. CPU, SRAM, program memory and data memory are operational. No peripheral modules are operating and PMD bits are set.

3: On-chip voltage regulator is disabled (ENVREG tied to VSS).

4: On-chip voltage regulator is enabled (ENVREG tied to VDD).

TABLE 27-7: DC CHARACTERISTICS: POWER-DOWN CURRENT (I_{PD})

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial			
Parameter No.	**Typical(1)**	**Max**	**Units**	**Conditions**		
Power-Down Current (I_{PD})(2)						
DC60	3	25	µA	-40°C	2.0V(3)	Base Power-Down Current(5)
DC60a	3	45	µA	+25°C		
DC60b	100	600	µA	+85°C		
DC60f	20	40	µA	-40°C	3.6V(4)	
DC60g	27	60	µA	+25°C		
DC60h	120	600	µA	+85°C		
Module Differential Current						
DC61	10	25	µA	-40°C	2.0V(3)	Watchdog Timer Current: ΔI_{WDT}(5)
DC61a	10	25	µA	+25°C		
DC61b	10	25	µA	+85°C		
DC61f	10	25	µA	-40°C	3.6V(4)	
DC61g	10	25	µA	+25°C		
DC61h	10	25	µA	+85°C		
DC62	8	15	µA	-40°C	2.0V(3)	RTCC + Timer1 w/32 kHz Crystal: ΔI_{RTCC}(5)
DC62a	8	15	µA	+25°C		
DC62b	8	15	µA	+85°C		
DC62f	8	15	µA	-40°C	3.6V(4)	
DC62g	8	15	µA	+25°C		
DC62h	8	15	µA	+85°C		

Note 1: Data in the Typical column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: Base I_{PD} is measured with all peripherals and clocks shut down. All I/Os are configured as inputs and pulled high. WDT, etc., are all switched off. Unused PMD bits are set. VREGS bit is clear.

3: On-chip voltage regulator is disabled (ENVREG tied to V_{SS}).

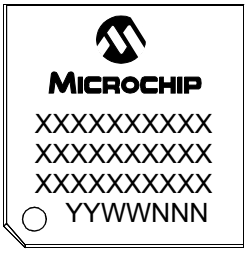
4: On-chip voltage regulator is enabled (ENVREG tied to V_{DD}).

5: The Δ current is the additional current consumed when the module is enabled. This current should be added to the base I_{PD} current.

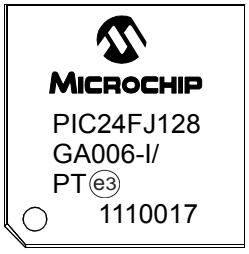
28.0 PACKAGING INFORMATION

28.1 Package Marking Information

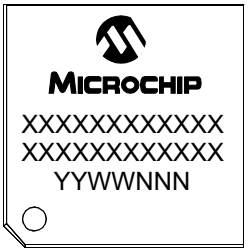
64-Lead TQFP (10x10x1 mm)



Example

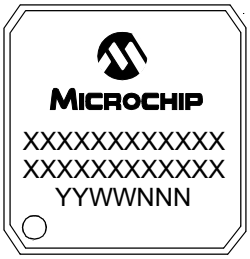


80-Lead TQFP (12x12x1 mm)



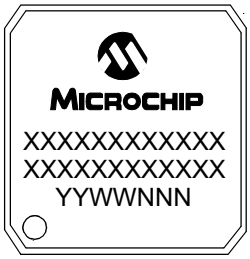
Example

100-Lead TQFP (12x12x1 mm)



Example

100-Lead TQFP (14x14x1 mm)

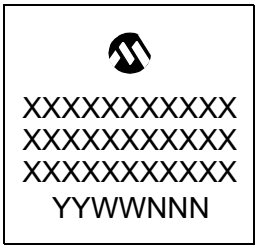


Example

Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
		Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

64-Lead QFN (9x9x0.9 mm)



Example
