Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	1057
Number of Logic Elements/Cells	10570
Total RAM Bits	920448
Number of I/O	426
Number of Gates	-
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	780-BBGA
Supplier Device Package	780-FBGA (29x29)
Purchase URL	https://www.e-xfl.com/product-detail/intel/ep1s10f780c5

Chapter	Date/Version	Changes Made
4	January 2005, 3.2	• Updated rise and fall input values.
	September 2004, v3.1	• Updated Note 3 in Table 4–8 on page 4–4. • Updated Table 4–10 on page 4–6. • Updated Table 4–20 on page 4–12 through Table 4–23 on page 4–13. Added rows $V_{IL(AC)}$ and $V_{IH(AC)}$ to each table. • Updated Table 4–26 on page 4–14 through Table 4–29 on page 4–15. • Updated Table 4–31 on page 4–16. • Updated description of "External Timing Parameters" on page 4–33. • Updated Table 4–36 on page 4–20. • Added signals t_{OUTCO}, T_{XZ}, and T_{ZX} to Figure 4–4 on page 4–33. • Added rows $t_{M512CLKENSU}$ and $t_{M512CLKENH}$ to Table 4–40 on page 4–24. • Added rows $t_{M4CLKENSU}$ and $t_{M4CLKENH}$ to Table 4–41 on page 4–24. • Updated Note 2 in Table 4–54 on page 4–35. • Added rows $t_{MRAMCLKENSU}$ and $t_{MRAMCLKENH}$ to Table 4–42 on page 4–25. • Updated Table 4–46 on page 4–29. • Updated Table 4–47 on page 4–29.

2. Stratix Architecture

S51002-3.2

Functional Description

Stratix® devices contain a two-dimensional row- and column-based architecture to implement custom logic. A series of column and row interconnects of varying length and speed provide signal interconnects between logic array blocks (LABs), memory block structures, and DSP blocks.

The logic array consists of LABs, with 10 logic elements (LEs) in each LAB. An LE is a small unit of logic providing efficient implementation of user logic functions. LABs are grouped into rows and columns across the device.

M512 RAM blocks are simple dual-port memory blocks with 512 bits plus parity (576 bits). These blocks provide dedicated simple dual-port or single-port memory up to 18-bits wide at up to 318 MHz. M512 blocks are grouped into columns across the device in between certain LABs.

M4K RAM blocks are true dual-port memory blocks with 4K bits plus parity (4,608 bits). These blocks provide dedicated true dual-port, simple dual-port, or single-port memory up to 36-bits wide at up to 291 MHz. These blocks are grouped into columns across the device in between certain LABs.

M-RAM blocks are true dual-port memory blocks with 512K bits plus parity (589,824 bits). These blocks provide dedicated true dual-port, simple dual-port, or single-port memory up to 144-bits wide at up to 269 MHz. Several M-RAM blocks are located individually or in pairs within the device's logic array.

Digital signal processing (DSP) blocks can implement up to either eight full-precision 9 × 9-bit multipliers, four full-precision 18 × 18-bit multipliers, or one full-precision 36 × 36-bit multiplier with add or subtract features. These blocks also contain 18-bit input shift registers for digital signal processing applications, including FIR and infinite impulse response (IIR) filters. DSP blocks are grouped into two columns in each device.

Each Stratix device I/O pin is fed by an I/O element (IOE) located at the end of LAB rows and columns around the periphery of the device. I/O pins support numerous single-ended and differential I/O standards. Each IOE contains a bidirectional I/O buffer and six registers for registering input, output, and output-enable signals. When used with

can drive other R8 interconnects to extend their range as well as C8 interconnects for row-to-row connections. One R8 interconnect is faster than two R4 interconnects connected together.

R24 row interconnects span 24 LABs and provide the fastest resource for long row connections between LABs, TriMatrix memory, DSP blocks, and IOEs. The R24 row interconnects can cross M-RAM blocks. R24 row interconnects drive to other row or column interconnects at every fourth LAB and do not drive directly to LAB local interconnects. R24 row interconnects drive LAB local interconnects via R4 and C4 interconnects. R24 interconnects can drive R24, R4, C16, and C4 interconnects.

The column interconnect operates similarly to the row interconnect and vertically routes signals to and from LABs, TriMatrix memory, DSP blocks, and IOEs. Each column of LABs is served by a dedicated column interconnect, which vertically routes signals to and from LABs, TriMatrix memory and DSP blocks, and horizontal IOEs. These column resources include:

- LUT chain interconnects within an LAB
- Register chain interconnects within an LAB
- C4 interconnects traversing a distance of four blocks in up and down direction
- C8 interconnects traversing a distance of eight blocks in up and down direction
- C16 column interconnects for high-speed vertical routing through the device

Stratix devices include an enhanced interconnect structure within LABs for routing LE output to LE input connections faster using LUT chain connections and register chain connections. The LUT chain connection allows the combinatorial output of an LE to directly drive the fast input of the LE right below it, bypassing the local interconnect. These resources can be used as a high-speed connection for wide fan-in functions from LE 1 to LE 10 in the same LAB. The register chain connection allows the register output of one LE to connect directly to the register input of the next LE in the LAB for fast shift registers. The Quartus II Compiler automatically takes advantage of these resources to improve utilization and performance. Figure 2–10 shows the LUT chain and register chain interconnects.

C8 interconnects span eight LABs, M512, or M4K blocks up or down from a source LAB. Every LAB has its own set of C8 interconnects to drive either up or down. C8 interconnect connections between the LABs in a column are similar to the C4 connections shown in Figure 2–11 with the exception that they connect to eight LABs above and below. The C8 interconnects can drive and be driven by all types of architecture blocks similar to C4 interconnects. C8 interconnects can drive each other to extend their range as well as R8 interconnects for column-to-column connections. C8 interconnects are faster than two C4 interconnects.

C16 column interconnects span a length of 16 LABs and provide the fastest resource for long column connections between LABs, TriMatrix memory blocks, DSP blocks, and IOEs. C16 interconnects can cross M-RAM blocks and also drive to row and column interconnects at every fourth LAB. C16 interconnects drive LAB local interconnects via C4 and R4 interconnects and do not drive LAB local interconnects directly.

All embedded blocks communicate with the logic array similar to LAB-to-LAB interfaces. Each block (i.e., TriMatrix memory and DSP blocks) connects to row and column interconnects and has local interconnect regions driven by row and column interconnects. These blocks also have direct link interconnects for fast connections to and from a neighboring LAB. All blocks are fed by the row LAB clocks, `labclk[7..0]`.

blocks facing to the left, and another 10 possible from the right adjacent LABs for M-RAM blocks facing to the right. For column interfacing, every M-RAM column unit connects to the right and left column lines, allowing each M-RAM column unit to communicate directly with three columns of LABs. Figures 2–21 through 2–23 show the interface between the M-RAM block and the logic array.

clock signals are routed from LAB row clocks and are generated from specific LAB rows at the DSP block interface. The LAB row source for control signals, data inputs, and outputs is shown in Table 2–17.

Table 2–17. DSP Block Signal Sources & Destinations

LAB Row at Interface	Control Signals Generated	Data Inputs	Data Outputs
1	signa	A1[17..0]	OA[17..0]
2	aclr0 accum_sload0	B1[17..0]	OB[17..0]

7	clear3 accum_sload1	A4[17..0]	OG[17..0]
8	addnsub3	B4[17..0]	OH[17..0]

PLLs & Clock Networks

Stratix devices provide a hierarchical clock structure and multiple PLLs with advanced features. The large number of clocking resources in combination with the clock synthesis precision provided by enhanced and fast PLLs provides a complete clock management solution.

Global & Hierarchical Clocking

Stratix devices provide 16 dedicated global clock networks, 16 regional clock networks (four per device quadrant), and 8 dedicated fast regional clock networks (for EP1S10, EP1S20, and EP1S25 devices), and 16 dedicated fast regional clock networks (for EP1S30 EP1S40, and EP1S60, and EP1S80 devices). These clocks are organized into a hierarchical clock structure that allows for up to 22 clocks per device region with low skew and delay. This hierarchical clocking scheme provides up to 48 unique clock domains within Stratix devices.

During switchover, the PLL VCO continues to run and will either slow down or speed up, generating frequency drift on the PLL outputs. The clock switchover transitions without any glitches. After the switch, there is a finite resynchronization period to lock onto new clock as the VCO ramps up. The exact amount of time it takes for the PLL to relock relates to the PLL configuration and may be adjusted by using the programmable bandwidth feature of the PLL. The specification for the maximum time to relock is 100 µs.

For more information on clock switchover, see *AN 313, Implementing Clock Switchover in Stratix & Stratix GX Devices*.

PLL Reconfiguration

The PLL reconfiguration feature enables system logic to change Stratix device enhanced PLL counters and delay elements without reloading a Programmer Object File (**.pof**). This provides considerable flexibility for frequency synthesis, allowing real-time PLL frequency and output clock delay variation. You can sweep the PLL output frequencies and clock delay in prototype environments. The PLL reconfiguration feature can also dynamically or intelligently control system clock speeds or t_{CO} delays in end systems.

Clock delay elements at each PLL output port implement variable delay. Figure 2–54 shows a diagram of the overall dynamic PLL control feature for the counters and the clock delay elements. The configuration time is less than 20 µs for the enhanced PLL using a input shift clock rate of 22 MHz. The charge pump, loop filter components, and phase shifting using VCO phase taps cannot be dynamically adjusted.

Table 2–20. I/O Standards Supported for Enhanced PLL Pins (Part 2 of 2)

I/O Standard	Input			Output
	INCLK	FBIN	PLLENABLE	EXTCLK
1.5-V HSTL Class II	✓	✓		✓
1.8-V HSTL Class I	✓	✓		✓

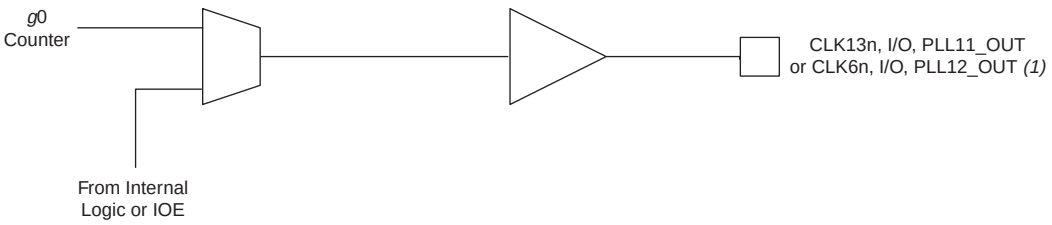
SSTL-2 Class II	✓	✓		✓
SSTL-3 Class I	✓	✓		✓
SSTL-3 Class II	✓	✓		✓
AGP (1× and 2×)	✓	✓		✓
CTT	✓	✓		✓

Enhanced PLLs 11 and 12 support one single-ended output each (see Figure 2–56). These outputs do not have their own VCC and GND signals. Therefore, to minimize jitter, do not place switching I/O pins next to this output pin.

Figure 2–56. External Clock Outputs for Enhanced PLLs 11 & 12



Note to Figure 2–56:
(1) For PLL 11, this pin is CLK13n; for PLL 12 this pin is CLK7n.

Stratix devices can drive any enhanced PLL driven through the global clock or regional clock network to any general I/O pin as an external output clock. The jitter on the output clock is not guaranteed for these cases.

The pllenable pin is a dedicated pin that enables/disables PLLs. When the pllenable pin is low, the clock output ports are driven by GND and all the PLLs go out of lock. When the pllenable pin goes high again, the PLLs relock and resynchronize to the input clocks. You can choose which PLLs are controlled by the pllenable signal by connecting the pllenable input port of the altpll megafunction to the common pllenable input pin.

The areset signals are reset/resynchronization inputs for each PLL. The areset signal should be asserted every time the PLL loses lock to guarantee correct phase relationship between the PLL output clocks. Users should include the areset signal in designs if any of the following conditions are true:

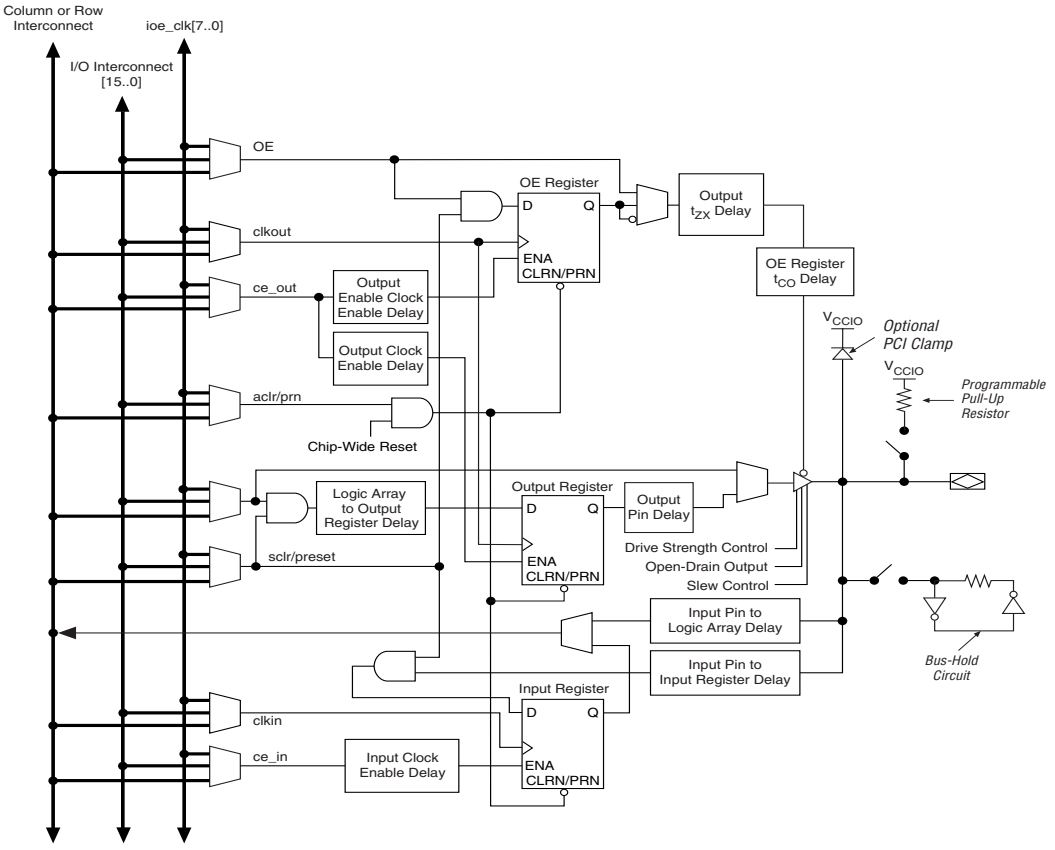
- PLL Reconfiguration or Clock switchover enables in the design.
- Phase relationships between output clocks need to be maintained after a loss of lock condition

The device input pins or logic elements (LEs) can drive these input signals. When driven high, the PLL counters will reset, clearing the PLL output and placing the PLL out of lock. The VCO will set back to its nominal setting (~700 MHz). When driven low again, the PLL will resynchronize to its input as it relocks. If the target VCO frequency is below this nominal frequency, then the output frequency will start at a higher value than desired as the PLL locks. If the system cannot tolerate this, the clkena signal can disable the output clocks until the PLL locks.

The pfdena signals control the phase frequency detector (PFD) output with a programmable gate. If you disable the PFD, the VCO operates at its last set value of control voltage and frequency with some long-term drift to a lower frequency. The system continues running when the PLL goes out of lock or the input clock is disabled. By maintaining the last locked frequency, the system has time to store its current settings before shutting down. You can either use your own control signal or a clkloss status signal to trigger pfdena.

The clkena signals control the enhanced PLL regional and global outputs. Each regional and global output port has its own clkena signal. The clkena signals synchronously disable or enable the clock at the PLL output port by gating the outputs of the *g* and *l* counters. The clkena signals are registered on the falling edge of the counter output clock to enable or disable the clock without glitches. Figure 2–57 shows the waveform example for a PLL clock port enable. The PLL can remain locked independent of the clkena signals since the loop-related counters are not affected. This feature is useful for applications that require a low power or sleep mode. Upon re-enabling, the PLL does not need a

Figure 2–64. Stratix IOE in Bidirectional I/O Configuration Note (1)



Note to Figure 2–64:
(1) All input signals to the IOE can be inverted at the IOE.

The Stratix device IOE includes programmable delays that can be activated to ensure zero hold times, input IOE register-to-logic array register transfers, or logic array-to-output IOE register transfers.

A path in which a pin directly drives a register may require the delay to ensure zero hold time, whereas a path in which a pin drives a register through combinatorial logic may not require the delay. Programmable delays exist for decreasing input-pin-to-logic-array and IOE input register delays. The Quartus II Compiler can program these delays to automatically minimize setup time while providing a zero hold time. Programmable delays can increase the register-to-pin delays for output

Table 2–37 shows the number of channels that each fast PLL can clock in EP1S10, EP1S20, and EP1S25 devices. Tables 2–38 through Table 2–41 show this information for EP1S30, EP1S40, EP1S60, and EP1S80 devices.

Skew on Input Pins

Table 4–99 shows the package skews that were considered to get the worst case I/O skew value. You can use these values, for example, when calculating the timing budget on the input (read) side of a memory interface.

Table 4–99. Package Skew on Input Pins

Package Parameter	Worst-Case Skew (ps)
Pins in the same I/O bank	50
Pins in top/bottom (vertical I/O) banks	50
Pins in left/right side (horizontal I/O) banks	50
Pins across the entire device	100

PLL Counter & Clock Network Skews

Table 4–100 shows the clock skews between different clock outputs from the Stratix device PLL.

Table 4–100. PLL Counter & Clock Network Skews

Parameter	Worst-Case Skew (ps)
Clock skew between two external clock outputs driven by the same counter	100
Clock skew between two external clock outputs driven by the different counters with the same settings	150
Dual-purpose PLL dedicated clock output used as I/O pin vs. regular I/O pin	270 *(1)*
Clock skew between any two outputs of the PLL that drive global clock networks	150

Note to Table 4–100:

(1) The Quartus II software models 270 ps of delay on the PLL dedicated clock output (`PLL6_OUT[3..0]p/n` and `PLL5_OUT[3..0]p/n`) pins both when used as clocks and when used as I/O pins.

I/O Timing Measurement Methodology

Different I/O standards require different baseline loading techniques for reporting timing delays. Altera characterizes timing delays with the required termination and loading for each I/O standard. The timing information is specified from the input clock pin up to the output pin of

Table 4–121. Stratix Maximum Output Clock Rate (Using I/O Pins) for PLL[1, 2, 3, 4] Pins in Flip-Chip Packages

I/O Standard	-5 Speed Grade	-6 Speed Grade	-7 Speed Grade	-8 Speed Grade	Unit
LVTTL	400	350	300	300	MHz
2.5 V	400	350	300	300	MHz
1.8 V	400	350	300	300	MHz
1.5 V	350	300	300	300	MHz
LVCMOS	400	350	300	300	MHz
GTL	200	167	125	125	MHz
GTL+	200	167	125	125	MHz
SSTL-3 Class I	167	150	133	133	MHz
SSTL-3 Class II	167	150	133	133	MHz
SSTL-2 Class I	150	133	133	133	MHz
SSTL-2 Class II	150	133	133	133	MHz
SSTL-18 Class I	150	133	133	133	MHz
SSTL-18 Class II	150	133	133	133	MHz
1.5-V HSTL Class I	250	225	200	200	MHz
1.5-V HSTL Class II	225	225	200	200	MHz
1.8-V HSTL Class I	250	225	200	200	MHz
1.8-V HSTL Class II	225	225	200	200	MHz
3.3-V PCI	250	225	200	200	MHz
3.3-V PCI-X 1.0	225	225	200	200	MHz
Compact PCI	400	350	300	300	MHz
AGP 1×	400	350	300	300	MHz
AGP 2×	400	350	300	300	MHz
CTT	300	250	200	200	MHz
LVPECL *(2)*	717	717	500	500	MHz
PCML *(2)*	420	420	420	420	MHz
LVDS *(2)*	717	717	500	500	MHz
HyperTransport technology *(2)*	420	420	420	420	MHz

Table 4–123. Stratix Maximum Output Clock Rate (Using I/O Pins) for PLL[1, 2, 3, 4] Pins in Wire-Bond Packages (Part 2 of 2)

I/O Standard	-6 Speed Grade	-7 Speed Grade	-8 Speed Grade	Unit
LVDS *(2)*	400	311	311	MHz
HyperTransport technology *(2)*	420	400	400	MHz

Notes to Tables 4–120 through 4–123:

(1) Differential SSTL-2 outputs are only available on column clock pins.
(2) These parameters are only available on row I/O pins.
(3) SSTL-2 in maximum drive strength condition. See Table 4–101 on page 4–62 for more information on exact loading conditions for each I/O standard.
(4) SSTL-2 in minimum drive strength with ≤10pF output load condition.
(5) SSTL-2 in minimum drive strength with > 10pF output load condition.
(6) Differential SSTL-2 outputs are only supported on column clock pins.
