
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	683
Number of Gates	-
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	956-BBGA
Supplier Device Package	956-BGA (40x40)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=ep1s30b956c5

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

Chapter 5. Reference & Ordering Information

Index

Features

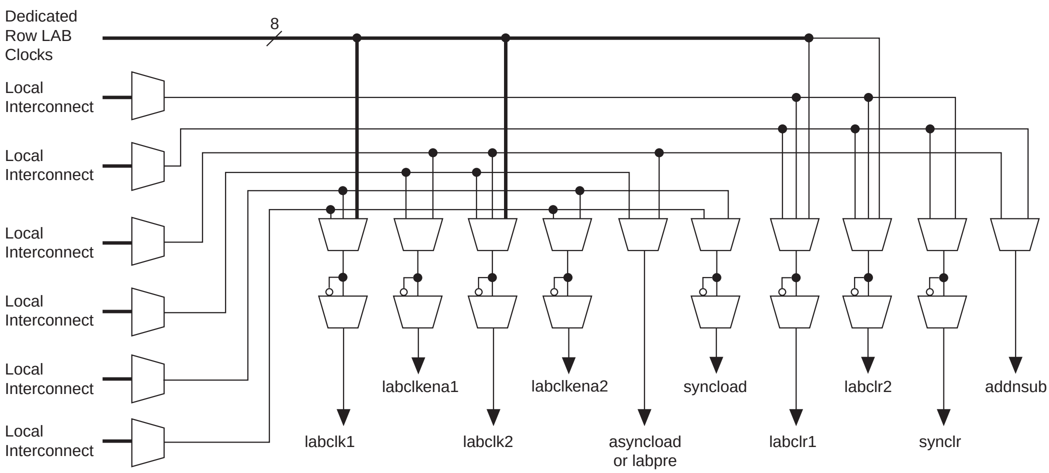
The Stratix family offers the following features:

- 10,570 to 79,040 LEs; see Table 1–1
- Up to 7,427,520 RAM bits (928,440 bytes) available without reducing logic resources
- TriMatrix™ memory consisting of three RAM block sizes to implement true dual-port memory and first-in first-out (FIFO) buffers
- High-speed DSP blocks provide dedicated implementation of multipliers (faster than 300 MHz), multiply-accumulate functions, and finite impulse response (FIR) filters
- Up to 16 global clocks with 22 clocking resources per device region
- Up to 12 PLLs (four enhanced PLLs and eight fast PLLs) per device provide spread spectrum, programmable bandwidth, clock switch-over, real-time PLL reconfiguration, and advanced multiplication and phase shifting
- Support for numerous single-ended and differential I/O standards
- High-speed differential I/O support on up to 116 channels with up to 80 channels optimized for 840 megabits per second (Mbps)
- Support for high-speed networking and communications bus standards including RapidIO, UTOPIA IV, CSIX, HyperTransport™ technology, 10G Ethernet XSBI, SPI-4 Phase 2 (POS-PHY Level 4), and SFI-4
- Differential on-chip termination support for LVDS
- Support for high-speed external memory, including zero bus turnaround (ZBT) SRAM, quad data rate (QDR and QDRII) SRAM, double data rate (DDR) SDRAM, DDR fast cycle RAM (FCRAM), and single data rate (SDR) SDRAM
- Support for 66-MHz PCI (64 and 32 bit) in -6 and faster speed-grade devices, support for 33-MHz PCI (64 and 32 bit) in -8 and faster speed-grade devices
- Support for 133-MHz PCI-X 1.0 in -5 speed-grade devices
- Support for 100-MHz PCI-X 1.0 in -6 and faster speed-grade devices
- Support for 66-MHz PCI-X 1.0 in -7 speed-grade devices
- Support for multiple intellectual property megafunctions from Altera MegaCore® functions and Altera Megafunction Partners Program (AMPP℠) megafunctions
- Support for remote configuration updates

With the LAB-wide `addnsub` control signal, a single LE can implement a one-bit adder and subtractor. This saves LE resources and improves performance for logic functions such as DSP correlators and signed multipliers that alternate between addition and subtraction depending on data.

The LAB row clocks [7..0] and LAB local interconnect generate the LAB-wide control signals. The MultiTrack™ interconnect's inherent low skew allows clock and control signal distribution in addition to data. Figure 2–4 shows the LAB control signal generation circuit.

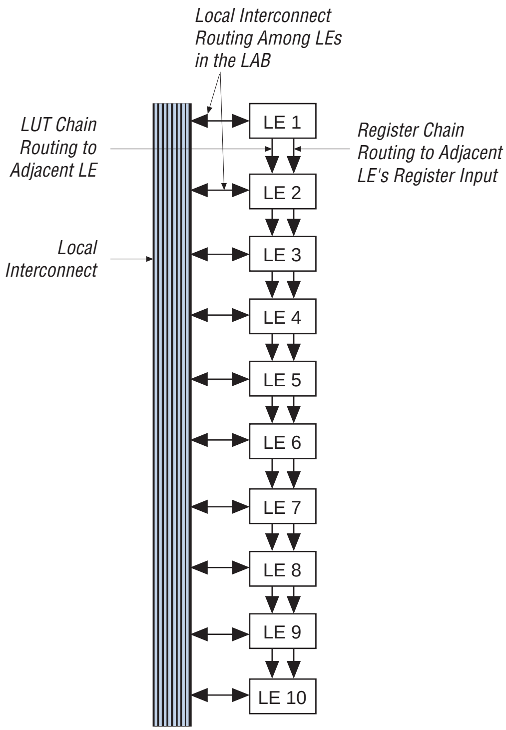
Figure 2–4. LAB-Wide Control Signals



Logic Elements

The smallest unit of logic in the Stratix architecture, the LE, is compact and provides advanced features with efficient logic utilization. Each LE contains a four-input LUT, which is a function generator that can implement any function of four variables. In addition, each LE contains a programmable register and carry chain with carry select capability. A single LE also supports dynamic single bit addition or subtraction mode selectable by an LAB-wide control signal. Each LE drives all types of interconnects: local, row, column, LUT chain, register chain, and direct link interconnects. See Figure 2–5.

Figure 2–10. LUT Chain & Register Chain Interconnects



The C4 interconnects span four LABs, M512, or M4K blocks up or down from a source LAB. Every LAB has its own set of C4 interconnects to drive either up or down. Figure 2–11 shows the C4 interconnect connections from an LAB in a column. The C4 interconnects can drive and be driven by all types of architecture blocks, including DSP blocks, TriMatrix memory blocks, and vertical IOEs. For LAB interconnection, a primary LAB or its LAB neighbor can drive a given C4 interconnect. C4 interconnects can drive each other to extend their range as well as drive row interconnects for column-to-column connections.

Table 2–2 shows the Stratix device's routing scheme.

Table 2–2. Stratix Device Routing Scheme

Source	Destination

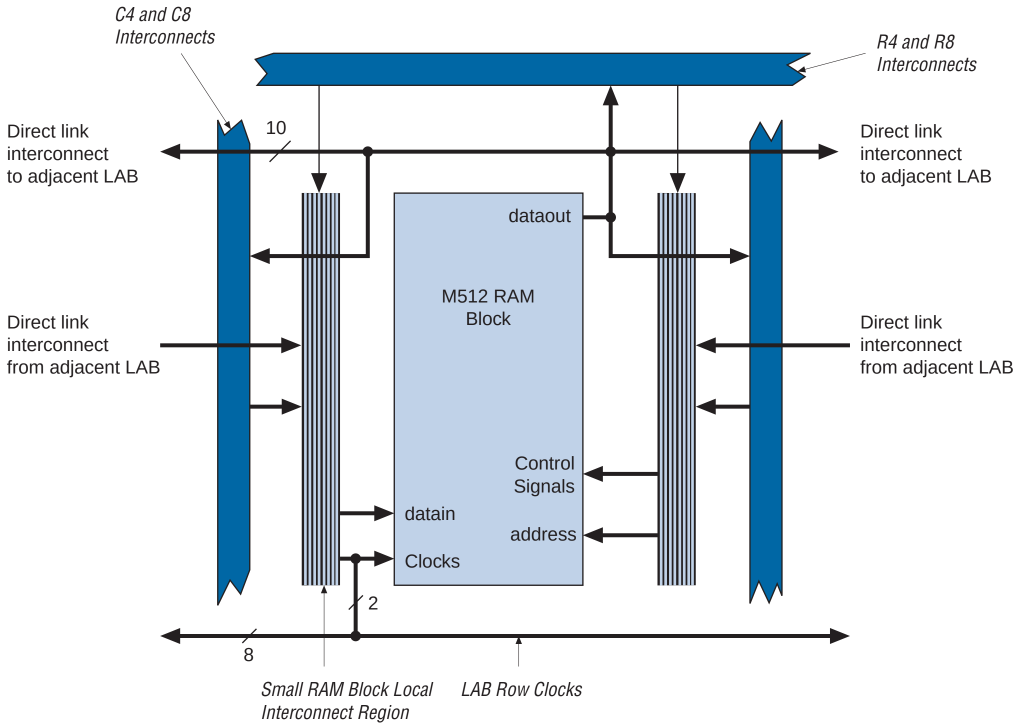
Figure 2–16. M512 RAM Block LAB Row Interface



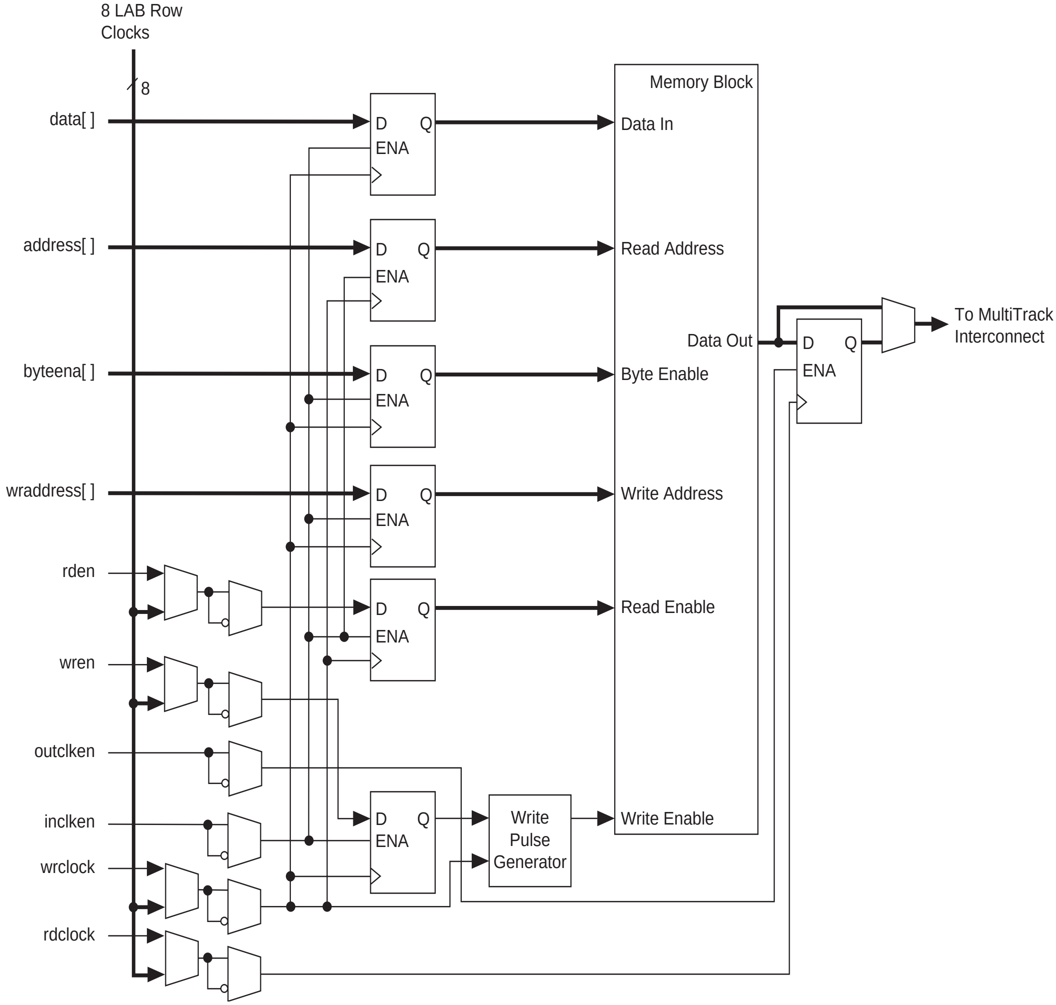
M4K RAM Blocks

The M4K RAM block includes support for true dual-port RAM. The M4K RAM block is used to implement buffers for a wide variety of applications such as storing processor code, implementing lookup schemes, and implementing larger memory applications. Each block contains 4,608 RAM bits (including parity bits). M4K RAM blocks can be configured in the following modes:

- True dual-port RAM
- Simple dual-port RAM
- Single-port RAM
- FIFO
- ROM
- Shift register

When configured as RAM or ROM, you can use an initialization file to pre-load the memory contents.

***Figure 2–26. Input/Output Clock Mode in Simple Dual-Port Mode** Notes (1), (2)*



Notes to Figure 2–26:

(1) All registers shown except the `rden` register have asynchronous clear ports.

(2) Violating the setup or hold time on the address registers could corrupt the memory contents. This applies to both read and write operations.

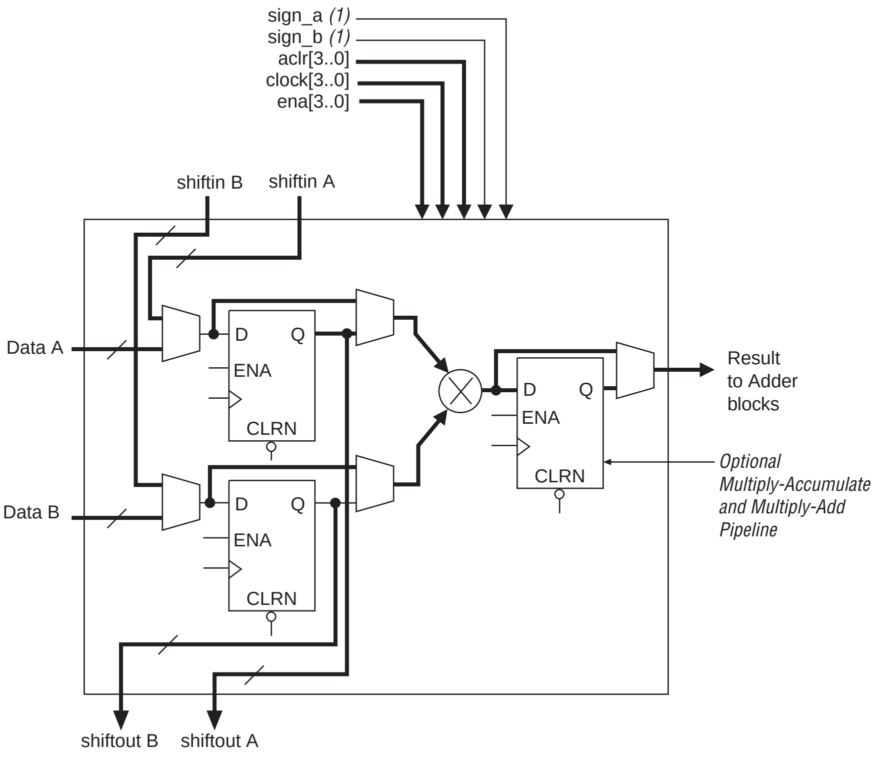
The DSP block consists of the following elements:

- Multiplier block
- Adder/output block

Multiplier Block

The DSP block multiplier block consists of the input registers, a multiplier, and pipeline register for pipelining multiply-accumulate and multiply-add/subtract functions as shown in Figure 2–32.

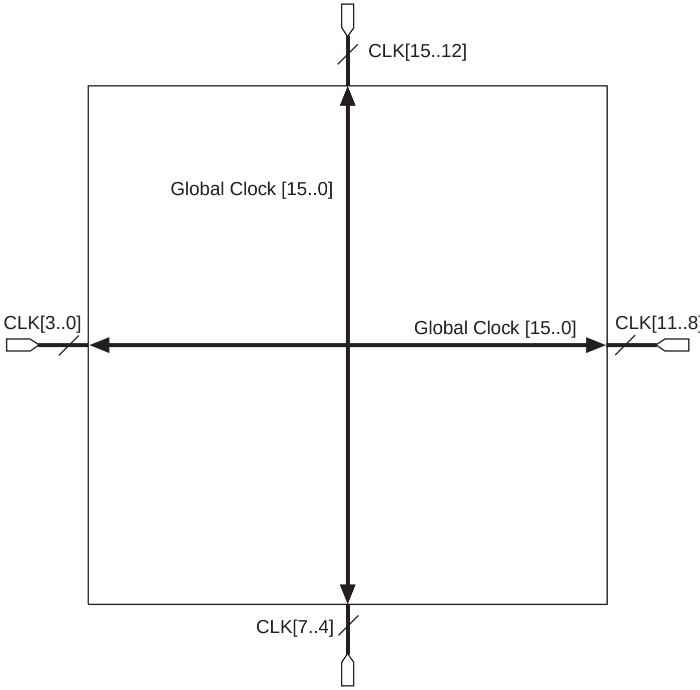
Figure 2–32. Multiplier Sub-Block within Stratix DSP Block



Note to Figure 2–32:

(1) These signals can be unregistered or registered once to match data path pipelines if required.

Figure 2–42. Global Clocking Note (1)



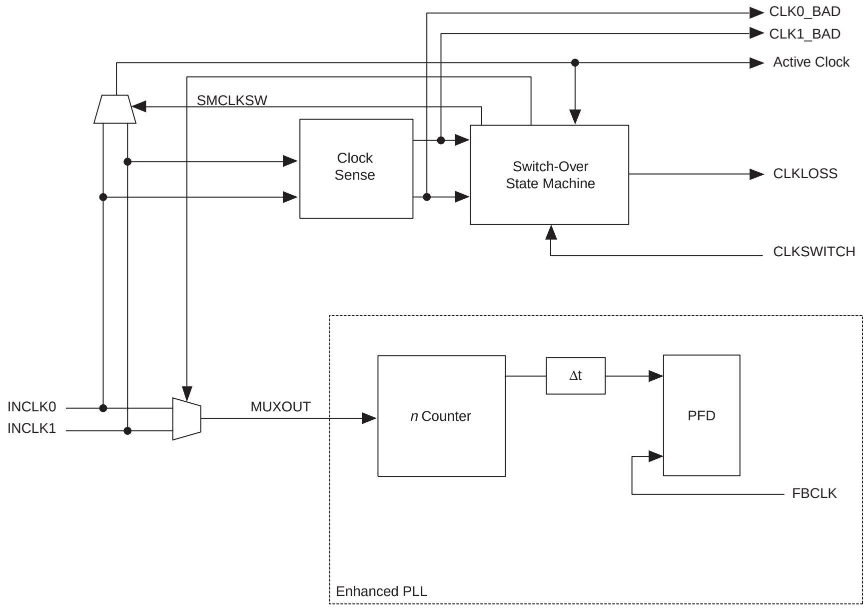
Note to Figure 2–42:

(1) The corner fast PLLs can also be driven through the global or regional clock networks. The global or regional clock input to the fast PLL can be driven by an output from another PLL, a pin-driven global or regional clock, or internally-generated global signals.

Regional Clock Network

There are four regional clock networks within each quadrant of the Stratix device that are driven by the same dedicated `CLK[15..0]` input pins or from PLL outputs. From a top view of the silicon, `RCLK[0..3]` are in the top left quadrant, `RCLK[8..11]` are in the top-right quadrant, `RCLK[4..7]` are in the bottom-left quadrant, and `RCLK[12..15]` are in the bottom-right quadrant. The regional clock networks only pertain to the quadrant they drive into. The regional clock networks provide the lowest clock delay and skew for logic contained within a single quadrant. `RCLK` cannot be driven by internal logic. The `CLK` clock pins symmetrically drive the `RCLK` networks within a particular quadrant, as shown in Figure 2–43. See Figures 2–50 and 2–51 for `RCLK` connections from PLLs and `CLK` pins.

Figure 2–53. Clock Switchover Circuitry



There are two possible ways to use the clock switchover feature.

- Use automatic switchover circuitry for switching between inputs of the same frequency. For example, in applications that require a redundant clock with the same frequency as the primary clock, the switchover state machine generates a signal that controls the multiplexer select input on the bottom of Figure 2–53. In this case, the secondary clock becomes the reference clock for the PLL.
- Use the `clkswitch` input for user- or system-controlled switch conditions. This is possible for same-frequency switchover or to switch between inputs of different frequencies. For example, if `inclk0` is 66 MHz and `inclk1` is 100 MHz, you must control the switchover because the automatic clock-sense circuitry cannot monitor primary and secondary clock frequencies with a frequency difference of more than ±20%. This feature is useful when clock sources can originate from multiple cards on the backplane, requiring a system-controlled switchover between frequencies of operation. You can use `clkswitch` together with the lock signal to trigger the switch from a clock that is running but becomes unstable and cannot be locked onto.

bandwidth is tuned by varying the charge pump current, loop filter resistor value, high frequency capacitor value, and *m* counter value. You can manually adjust these values if desired. Bandwidth is programmable from 200 kHz to 1.5 MHz.

External Clock Outputs

Enhanced PLLs 5 and 6 each support up to eight single-ended clock outputs (or four differential pairs). Differential SSTL and HSTL outputs are implemented using 2 single-ended output buffers which are programmed to have opposite polarity. In Quartus II software, simply assign the appropriate differential I/O standard and the software will implement the inversion. See Figure 2–55.

Table 2–27. DQS & DQ Bus Mode Support (Part 2 of 2) Note (1)				
Device	**Package**	**Number of ×8 Groups**	**Number of ×16 Groups**	**Number of ×32 Groups**
EP1S25	672-pin BGA 672-pin FineLine BGA	16 *(3)*	8	4

EP1S80	956-pin BGA 1,508-pin FineLine BGA 1,923-pin FineLine BGA	20	8	4

Notes to Table 2–27:

(1) See the *Selectable I/O Standards in Stratix & Stratix GX Devices* chapter in the *Stratix Device Handbook, Volume 2* for V_{REF} guidelines.

(2) These packages have six groups in I/O banks 3 and 4 and six groups in I/O banks 7 and 8.

(3) These packages have eight groups in I/O banks 3 and 4 and eight groups in I/O banks 7 and 8.

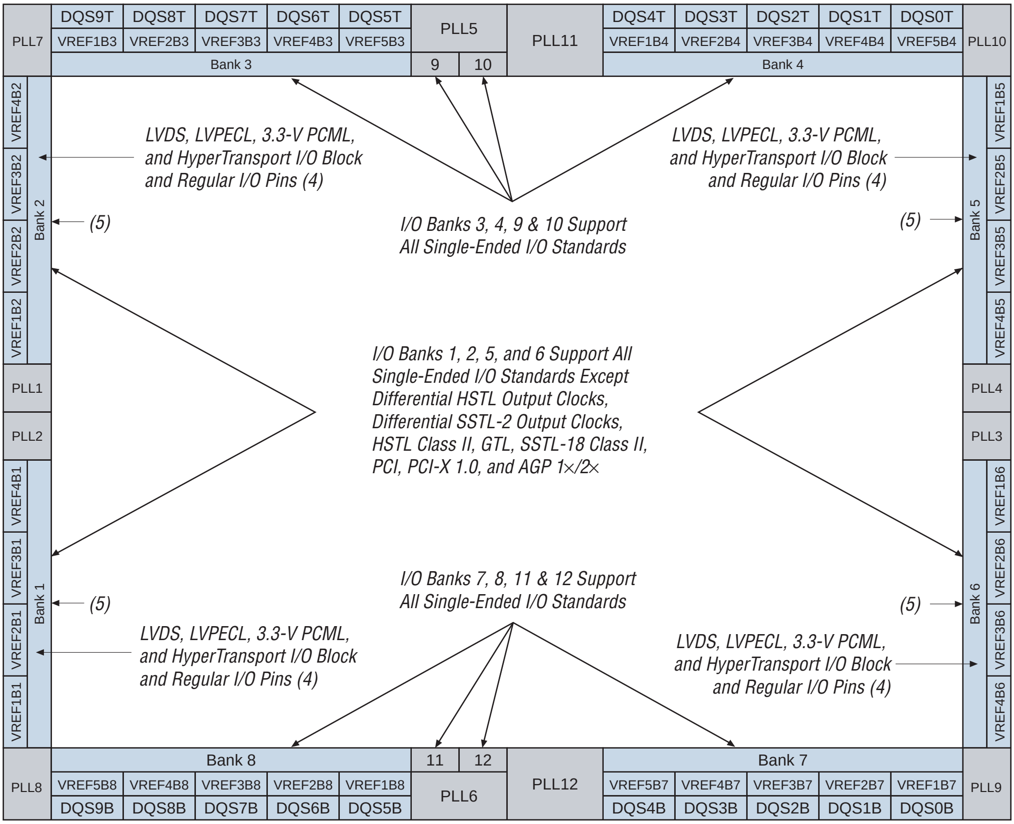
(4) This package has nine groups in I/O banks 3 and 4 and nine groups in I/O banks 7 and 8.

(5) These packages have three groups in I/O banks 3 and 4 and four groups in I/O banks 7 and 8.

A compensated delay element on each DQS pin automatically aligns input DQS synchronization signals with the data window of their corresponding DQ data signals. The DQS signals drive a local DQS bus in the top and bottom I/O banks. This DQS bus is an additional resource to the I/O clocks and is used to clock DQ input registers with the DQS signal.

Two separate single phase-shifting reference circuits are located on the top and bottom of the Stratix device. Each circuit is driven by a system reference clock through the `CLK` pins that is the same frequency as the DQS signal. Clock pins `CLK[15..12]p` feed the phase-shift circuitry on the top of the device and clock pins `CLK[7..4]p` feed the phase-shift circuitry on the bottom of the device. The phase-shifting reference circuit on the top of the device controls the compensated delay elements for all 10 DQS pins located at the top of the device. The phase-shifting reference circuit on the bottom of the device controls the compensated delay elements for all 10 DQS pins located on the bottom of the device. All 10 delay elements (DQS signals) on either the top or bottom of the device

Figure 2–70. Stratix I/O Banks *Notes (1), (2), (3)*



Notes to Figure 2–70:

(1) Figure 2–70 is a top view of the silicon die. This will correspond to a top-down view for non-flip-chip packages, but will be a reverse view for flip-chip packages.

(2) Figure 2–70 is a graphic representation only. See the device pin-outs on the web (**www.altera.com**) and the Quartus II software for exact locations.

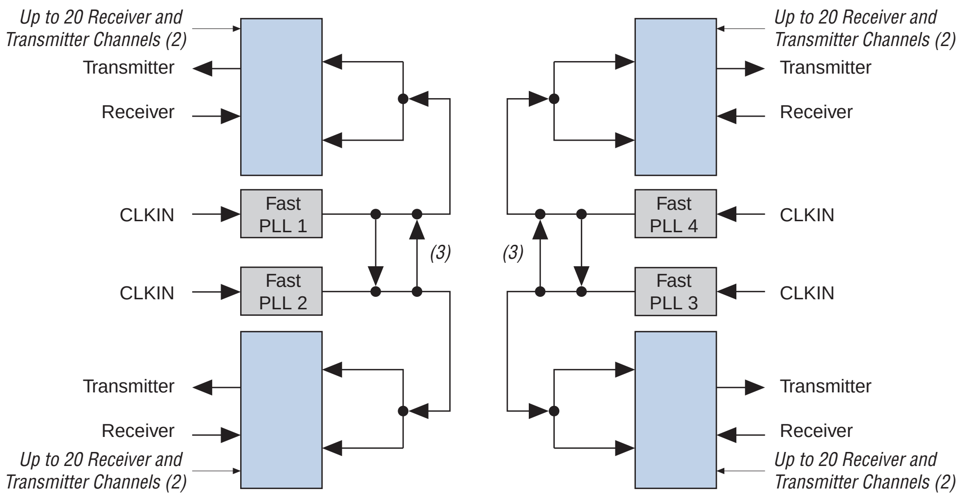
(3) Banks 9 through 12 are enhanced PLL external clock output banks.

(4) If the high-speed differential I/O pins are not used for high-speed differential signaling, they can support all of the I/O standards except HSTL Class I and II, GTL, SSTL-18 Class II, PCI, PCI-X 1.0, and AGP 1× /2×.

(5) For guidelines for placing single-ended I/O pads next to differential I/O pads, see the *Selectable I/O Standards in Stratix and Stratix GX Devices* chapter in the *Stratix Device Handbook, Volume 2*.

The Quartus II MegaWizard® Plug-In Manager only allows the implementation of up to 20 receiver or 20 transmitter channels for each fast PLL. These channels operate at up to 840 Mbps. The receiver and transmitter channels are interleaved such that each I/O bank on the left and right side of the device has one receiver channel and one transmitter channel per LAB row. Figure 2–74 shows the fast PLL and channel layout in EP1S10, EP1S20, and EP1S25 devices. Figure 2–75 shows the fast PLL and channel layout in the EP1S30 to EP1S80 devices.

Figure 2–74. Fast PLL & Channel Layout in the EP1S10, EP1S20 or EP1S25 Devices Note (1)



Notes to Figure 2–74:
(1) Wire-bond packages support up to 624 Mbps.
(2) See Table 2–41 for the number of channels each device supports.
(3) There is a multiplexer here to select the PLL clock source. If a PLL uses this multiplexer to clock channels outside of its bank quadrant, those clocked channels support up to 840 Mbps for “high” speed channels and 462 Mbps for “low” speed channels, as labeled in the device pin-outs at **www.altera.com**.

5. Reference & Ordering Information

S51005-2.1

Software

Stratix® devices are supported by the Altera® Quartus® II design software, which provides a comprehensive environment for system-on-a-programmable-chip (SOPC) design. The Quartus II software includes HDL and schematic design entry, compilation and logic synthesis, full simulation and advanced timing analysis, SignalTap® II logic analyzer, and device configuration. See the *Design Software Selector Guide* for more details on the Quartus II software features.

The Quartus II software supports the Windows XP/2000/NT/98, Sun Solaris, Linux Red Hat v7.1 and HP-UX operating systems. It also supports seamless integration with industry-leading EDA tools through the NativeLink® interface.

Device Pin-Outs

Stratix device pin-outs can be found on the Altera web site **(www.altera.com).**

Ordering Information

Figure 5–1 describes the ordering codes for Stratix devices. For more information on a specific package, see the *Package Information for Stratix Devices* chapter.
