
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	726
Number of Gates	-
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	1020-BBGA
Supplier Device Package	1020-FBGA (33x33)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=ep1s30f1020c7n

Chapter Revision Dates

The chapters in this book, *Stratix Device Handbook, Volume 1*, were revised on the following dates. Where chapters or groups of chapters are available separately, part numbers are listed.

Chapter 1. Introduction
Revised: *July 2005*
Part number: *S51001-3.2*

Chapter 2. Stratix Architecture
Revised: *July 2005*
Part number: *S51002-3.2*

Chapter 3. Configuration & Testing
Revised: *July 2005*
Part number: *S51003-1.3*

Chapter 4. DC & Switching Characteristics
Revised: *January 2006*
Part number: *S51004-3.4*

Chapter 5. Reference & Ordering Information
Revised: *September 2004*
Part number: *S51005-2.1*

Section I. Stratix Device Family Data Sheet

This section provides the data sheet specifications for Stratix® devices. They contain feature definitions of the internal architecture, configuration and JTAG boundary-scan testing information, DC operating conditions, AC timing parameters, a reference to power consumption, and ordering information for Stratix devices.

This section contains the following chapters:

- Chapter 1, Introduction
- Chapter 2, Stratix Architecture
- Chapter 3, Configuration & Testing
- Chapter 4, DC & Switching Characteristics
- Chapter 5, Reference & Ordering Information

Revision History

The table below shows the revision history for Chapters 1 through 5.

Chapter	Date/Version	Changes Made
1	July 2005, v3.2	• Minor content changes.
	September 2004, v3.1	• Updated Table 1–6 on page 1–5.
	April 2004, v3.0	• Main section page numbers changed on first page. • Changed PCI-X to PCI-X 1.0 in "Features" on page 1–2. • Global change from SignalTap to SignalTap II. • The DSP blocks in "Features" on page 1–2 provide dedicated implementation of multipliers that are now "faster than 300 MHz."
	January 2004, v2.2	• Updated -5 speed grade device information in Table 1-6.
	October 2003, v2.1	• Add -8 speed grade device information.
	July 2003, v2.0	• Format changes throughout chapter.

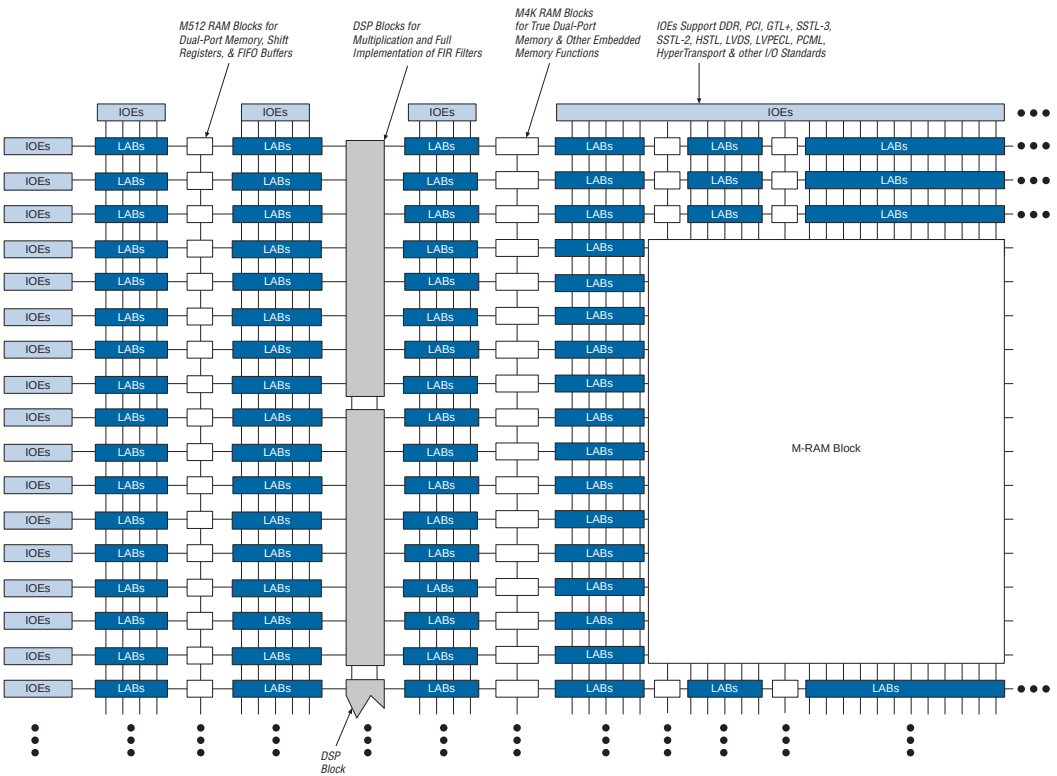
Chapter	Date/Version	Changes Made
4		• Table 4–48 on page 4–30: added rows $t_{M512CLKSENSU}$ and $t_{M512CLKENH}$, and updated symbol names. • Updated power-up current (ICCINT) required to power a Stratix device on page 4–17. • Updated Table 4–37 on page 4–22 through Table 4–43 on page 4–27. • Table 4–49 on page 4–31: added rows $t_{M4KCLKENSU}$, $t_{M4KCLKENH}$, $t_{M4KBESU}$, and $t_{M4KBEH,}$ deleted rows $t_{M4KRADDRASU}$ and $t_{M4KRADDRH}$, and updated symbol names. • Table 4–50 on page 4–31: added rows $t_{MRAMCLKENSU}$, $t_{MRAMCLKENH}$, $t_{MRAMBESU}$, and $t_{MRAMBEH}$, deleted rows $t_{MRAMADDRASU}$ and $t_{MRAMRADDRH}$, and updated symbol names. • Table 4–52 on page 4–34: updated table, deleted “Conditions” column, and added rows t_{XZ} and t_{ZX}. • Table 4–52 on page 4–34: updated table, deleted “Conditions” column, and added rows t_{XZ} and t_{ZX}. • Table 4–53 on page 4–34: updated table and added rows t_{XZPLL} and t_{ZXPLL}. • Updated Note 2 in Table 4–53 on page 4–34. • Table 4–54 on page 4–35: updated table, deleted “Conditions” column, and added rows t_{XZPLL} and t_{ZXPLL}. • Updated Note 2 in Table 4–54 on page 4–35. • Deleted Note 2 from Table 4–55 on page 4–36 through Table 4–66 on page 4–41. • Updated Table 4–55 on page 4–36 through Table 4–96 on page 4–56. Added rows T_{XZ}, T_{ZX}, T_{XZPLL}, and $T_{ZXPLL.}$ • Added Note 4 to Table 4–101 on page 4–62. • Deleted Note 1 from Table 4–67 on page 4–42 through Table 4–84 on page 4–50. • Added new section “I/O Timing Measurement Methodology” on page 4–60. • Deleted Note 1 from Table 4–67 on page 4–42 through Table 4–84 on page 4–50. • Deleted Note 2 from Table 4–85 on page 4–51 through Table 4–96 on page 4–56. • Added Note 4 to Table 4–101 on page 4–62. • Table 4–102 on page 4–64: updated table and added Note 4. • Updated description of “External I/O Delay Parameters” on page 4–66. • Added Note 1 to Table 4–109 on page 4–73 and Table 4–110 on page 4–74. • Updated Table 4–103 on page 4–66 through Table 4–110 on page 4–74. • Deleted Note 2 from Table 4–103 on page 4–66 through Table 4–106 on page 4–69. • Added new paragraph about output adder delays on page 4–68. • Updated Table 4–110 on page 4–74. • Added Note 1 to Table 4–111 through Table 4–113 on page 4–75.

dedicated clocks, these registers provide exceptional performance and interface support with external memory devices such as DDR SDRAM, FCRAM, ZBT, and QDR SRAM devices.

High-speed serial interface channels support transfers at up to 840 Mbps using LVDS, LVPECL, 3.3-V PCML, or HyperTransport technology I/O standards.

Figure 2–1 shows an overview of the Stratix device.

Figure 2–1. Stratix Block Diagram

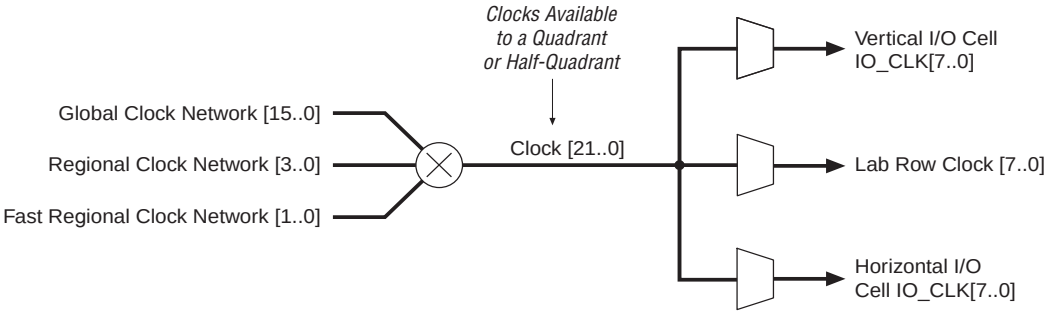


C8 interconnects span eight LABs, M512, or M4K blocks up or down from a source LAB. Every LAB has its own set of C8 interconnects to drive either up or down. C8 interconnect connections between the LABs in a column are similar to the C4 connections shown in Figure 2–11 with the exception that they connect to eight LABs above and below. The C8 interconnects can drive and be driven by all types of architecture blocks similar to C4 interconnects. C8 interconnects can drive each other to extend their range as well as R8 interconnects for column-to-column connections. C8 interconnects are faster than two C4 interconnects.

C16 column interconnects span a length of 16 LABs and provide the fastest resource for long column connections between LABs, TriMatrix memory blocks, DSP blocks, and IOEs. C16 interconnects can cross M-RAM blocks and also drive to row and column interconnects at every fourth LAB. C16 interconnects drive LAB local interconnects via C4 and R4 interconnects and do not drive LAB local interconnects directly.

All embedded blocks communicate with the logic array similar to LAB-to-LAB interfaces. Each block (i.e., TriMatrix memory and DSP blocks) connects to row and column interconnects and has local interconnect regions driven by row and column interconnects. These blocks also have direct link interconnects for fast connections to and from a neighboring LAB. All blocks are fed by the row LAB clocks, `labclk[7..0]`.

Figure 2–46. Regional Clock Bus



IOE clocks have horizontal and vertical block regions that are clocked by eight I/O clock signals chosen from the 22 quadrant or half-quadrant clock resources. Figures 2–47 and 2–48 show the quadrant and half-quadrant relationship to the I/O clock regions, respectively. The vertical regions (column pins) have less clock delay than the horizontal regions (row pins).

Table 2–19 shows the enhanced PLL and fast PLL features in Stratix devices.

Table 2–19. Stratix PLL Features

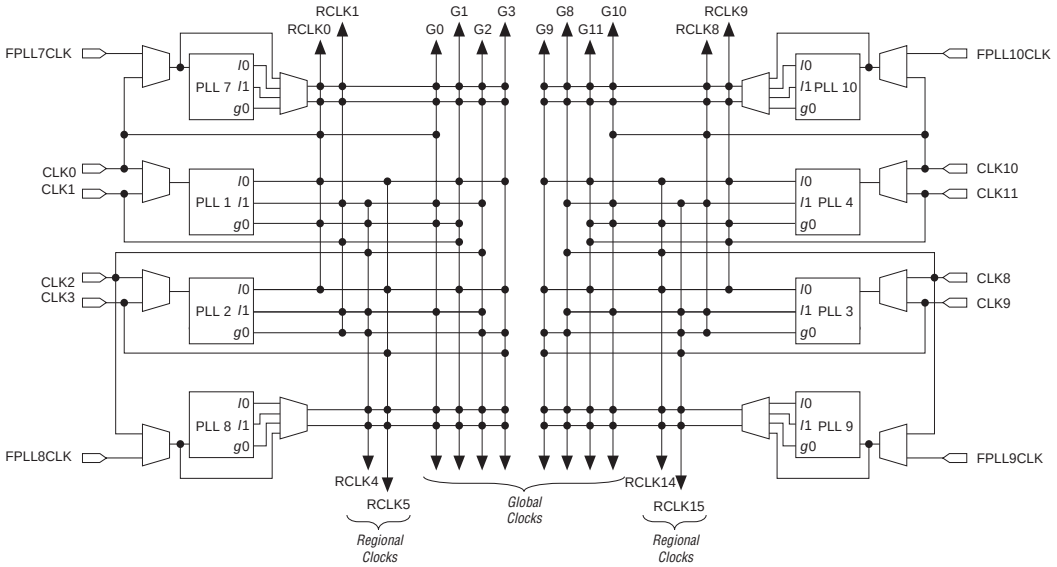
Feature	Enhanced PLL	Fast PLL
Clock multiplication and division	*m*/(*n* × post-scale counter) *(1)*	*m*/(post-scale counter) *(2)*
Phase shift	Down to 156.25-ps increments *(3)*, *(4)*	Down to 125-ps increments *(3)*, *(4)*
Delay shift	250-ps increments for ±3 ns	
Clock switchover	✓	
PLL reconfiguration	✓	
Programmable bandwidth	✓	
Spread spectrum clocking	✓	
Programmable duty cycle	✓	✓
Number of internal clock outputs	6	3 *(5)*
Number of external clock outputs	Four differential/eight singled-ended or one single-ended *(6)*	*(7)*
Number of feedback clock inputs	2 *(8)*	

Notes to Table 2–19:

(1) For enhanced PLLs, *m*, *n*, range from 1 to 512 and post-scale counters *g*, *l*, *e* range from 1 to 1024 with 50% duty cycle. With a non-50% duty cycle the post-scale counters *g*, *l*, *e* range from 1 to 512.
(2) For fast PLLs, *m* and post-scale counters range from 1 to 32.
(3) The smallest phase shift is determined by the voltage controlled oscillator (VCO) period divided by 8.
(4) For degree increments, Stratix devices can shift all output frequencies in increments of at least 45° . Smaller degree increments are possible depending on the frequency and divide parameters.
(5) PLLs 7, 8, 9, and 10 have two output ports per PLL. PLLs 1, 2, 3, and 4 have three output ports per PLL.
(6) Every Stratix device has two enhanced PLLs (PLLs 5 and 6) with either eight single-ended outputs or four differential outputs each. Two additional enhanced PLLs (PLLs 11 and 12) in EP1S80, EP1S60, and EP1S40 devices each have one single-ended output. Devices in the 780 pin FineLine BGA packages do not support PLLs 11 and 12.
(7) Fast PLLs can drive to any I/O pin as an external clock. For high-speed differential I/O pins, the device uses a data channel to generate `txclkout`.
(8) Every Stratix device has two enhanced PLLs with one single-ended or differential external feedback input per PLL.

Figure 2–50 shows the global and regional clocking from the PLL outputs and the CLK pins.

Figure 2–50. Global & Regional Clock Connections from Side Pins & Fast PLL Outputs *Note (1), (2)*



Notes to Figure 2–50:

(1) PLLs 1 to 4 and 7 to 10 are fast PLLs. PLLs 5, 6, 11, and 12 are enhanced PLLs.

(2) The global or regional clocks in a fast PLL's quadrant can drive the fast PLL input. A pin or other PLL must drive the global or regional source. The source cannot be driven by internally generated logic before driving the fast PLL.

Figure 2–51 shows the global and regional clocking from enhanced PLL outputs and top `CLK` pins.

During switchover, the PLL VCO continues to run and will either slow down or speed up, generating frequency drift on the PLL outputs. The clock switchover transitions without any glitches. After the switch, there is a finite resynchronization period to lock onto new clock as the VCO ramps up. The exact amount of time it takes for the PLL to relock relates to the PLL configuration and may be adjusted by using the programmable bandwidth feature of the PLL. The specification for the maximum time to relock is 100 µs.

For more information on clock switchover, see *AN 313, Implementing Clock Switchover in Stratix & Stratix GX Devices*.

PLL Reconfiguration

The PLL reconfiguration feature enables system logic to change Stratix device enhanced PLL counters and delay elements without reloading a Programmer Object File (**.pof**). This provides considerable flexibility for frequency synthesis, allowing real-time PLL frequency and output clock delay variation. You can sweep the PLL output frequencies and clock delay in prototype environments. The PLL reconfiguration feature can also dynamically or intelligently control system clock speeds or t_{CO} delays in end systems.

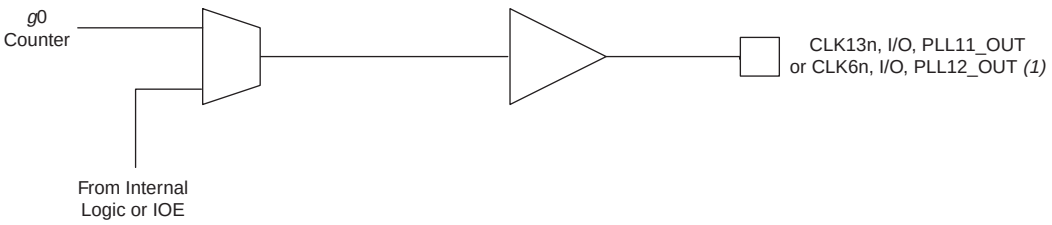
Clock delay elements at each PLL output port implement variable delay. Figure 2–54 shows a diagram of the overall dynamic PLL control feature for the counters and the clock delay elements. The configuration time is less than 20 µs for the enhanced PLL using a input shift clock rate of 22 MHz. The charge pump, loop filter components, and phase shifting using VCO phase taps cannot be dynamically adjusted.

Table 2–20. I/O Standards Supported for Enhanced PLL Pins (Part 2 of 2)

I/O Standard	Input			Output
	INCLK	FBIN	PLLENABLE	EXTCLK
1.5-V HSTL Class II	✓	✓		✓
1.8-V HSTL Class I	✓	✓		✓
1.8-V HSTL Class II	✓	✓		✓
SSTL-18 Class I	✓	✓		✓
SSTL-18 Class II	✓	✓		✓
SSTL-2 Class I	✓	✓		✓
SSTL-2 Class II	✓	✓		✓
SSTL-3 Class I	✓	✓		✓
SSTL-3 Class II	✓	✓		✓
AGP (1× and 2×)	✓	✓		✓
CTT	✓	✓		✓

Enhanced PLLs 11 and 12 support one single-ended output each (see Figure 2–56). These outputs do not have their own VCC and GND signals. Therefore, to minimize jitter, do not place switching I/O pins next to this output pin.

Figure 2–56. External Clock Outputs for Enhanced PLLs 11 & 12



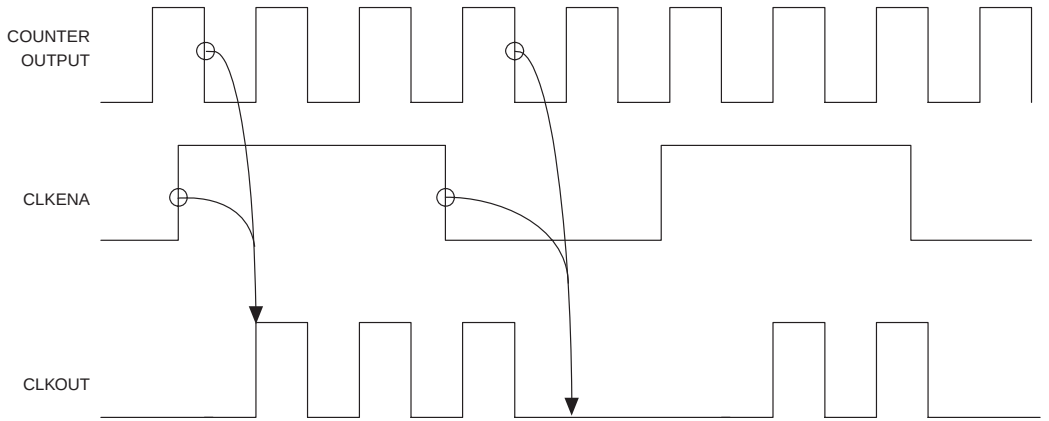
Note to Figure 2–56:
(1) For PLL 11, this pin is CLK13n; for PLL 12 this pin is CLK7n.

Stratix devices can drive any enhanced PLL driven through the global clock or regional clock network to any general I/O pin as an external output clock. The jitter on the output clock is not guaranteed for these cases.

resynchronization or relock period. The clkena signal can also disable clock outputs if the system is not tolerant to frequency overshoot during resynchronization.

The extclkena signals work in the same way as the clkena signals, but they control the external clock output counters (*e*0, *e*1, *e*2, and *e*3). Upon re-enabling, the PLL does not need a resynchronization or relock period unless the PLL is using external feedback mode. In order to lock in external feedback mode, the external output must drive the board trace back to the FBIN pin.

Figure 2–57. extclkena Signals



Fast PLLs

Stratix devices contain up to eight fast PLLs with high-speed serial interfacing ability, along with general-purpose features. Figure 2–58 shows a diagram of the fast PLL.

Tables 2–25 and 2–26 show the performance specification for DDR SDRAM, RLDRAM II, QDR SRAM, QDRII SRAM, and ZBT SRAM interfaces in EP1S10 through EP1S40 devices and in EP1S60 and EP1S80 devices. The DDR SDRAM and QDR SRAM numbers in Table 2–25 have been verified with hardware characterization with third-party DDR SDRAM and QDR SRAM devices over temperature and voltage extremes.

Table 2–25. External RAM Support in EP1S10 through EP1S40 Devices

DDR Memory Type	I/O Standard	Maximum Clock Rate (MHz)						
		-5 Speed Grade	-6 Speed Grade		-7 Speed Grade		-8 Speed Grade	
		Flip-Chip	Flip-Chip	Wire-Bond	Flip-Chip	Wire-Bond	Flip-Chip	Wire-Bond
DDR SDRAM *(1)*, *(2)*	SSTL-2	200	167	133	133	100	100	100
DDR SDRAM - side banks *(2)*, *(3)*, *(4)*	SSTL-2	150	133	110	133	100	100	100
RLDRAM II *(4)*	1.8-V HSTL	200	*(5)*	*(5)*	*(5)*	*(5)*	*(5)*	*(5)*
QDR SRAM *(6)*	1.5-V HSTL	167	167	133	133	100	100	100
QDRII SRAM *(6)*	1.5-V HSTL	200	167	133	133	100	100	100
ZBT SRAM *(7)*	LVTTL	200	200	200	167	167	133	133

Notes to Table 2–25:

(1) These maximum clock rates apply if the Stratix device uses DQS phase-shift circuitry to interface with DDR SDRAM. DQS phase-shift circuitry is only available in the top and bottom I/O banks (I/O banks 3, 4, 7, and 8).

(2) For more information on DDR SDRAM, see *AN 342: Interfacing DDR SDRAM with Stratix & Stratix GX Devices.*

(3) DDR SDRAM is supported on the Stratix device side I/O banks (I/O banks 1, 2, 5, and 6) without dedicated DQS phase-shift circuitry. The read DQS signal is ignored in this mode.

(4) These performance specifications are preliminary.

(5) This device does not support RLDRAM II.

(6) For more information on QDR or QDRII SRAM, see *AN 349: QDR SRAM Controller Reference Design for Stratix & Stratix GX Devices*.

(7) For more information on ZBT SRAM, see *AN 329: ZBT SRAM Controller Reference Design for Stratix & Stratix GX Devices*.

The only way you can use the `rx_data_align` is if one of the following is true:

- The receiver PLL is only clocking receive channels (no resources for the transmitter)
- If all channels can fit in one I/O bank

Table 2–38. EP1S30 Differential Channels Note (1)

Package	Transmitter /Receiver	Total Channels	Maximum Speed (Mbps)	Center Fast PLLs				Corner Fast PLLs (2), (3)			
				PLL1	PLL2	PLL3	PLL4	PLL7	PLL8	PLL9	PLL10

The transmitter external clock output is transmitted on a data channel. The txclk pin for each bank is located in between data transmitter pins. For ×1 clocks (e.g., 622 Mbps, 622 MHz), the high-speed PLL clock bypasses the SERDES to drive the output pins. For half-rate clocks (e.g., 622 Mbps, 311 MHz) or any other even-numbered factor such as 1/4, 1/7, 1/8, or 1/10, the SERDES automatically generates the clock in the Quartus II software.

For systems that require more than four or eight high-speed differential I/O clock domains, a SERDES bypass implementation is possible using IOEs.

Byte Alignment

For high-speed source synchronous interfaces such as POS-PHY 4, XSBI, RapidIO, and HyperTransport technology, the source synchronous clock rate is not a byte- or SERDES-rate multiple of the data rate. Byte alignment is necessary for these protocols since the source synchronous clock does not provide a byte or word boundary since the clock is one half the data rate, not one eighth. The Stratix device's high-speed differential I/O circuitry provides dedicated data realignment circuitry for user-controlled byte boundary shifting. This simplifies designs while saving LE resources. An input signal to each fast PLL can stall deserializer parallel data outputs by one bit period. You can use an LE-based state machine to signal the shift of receiver byte boundaries until a specified pattern is detected to indicate byte alignment.

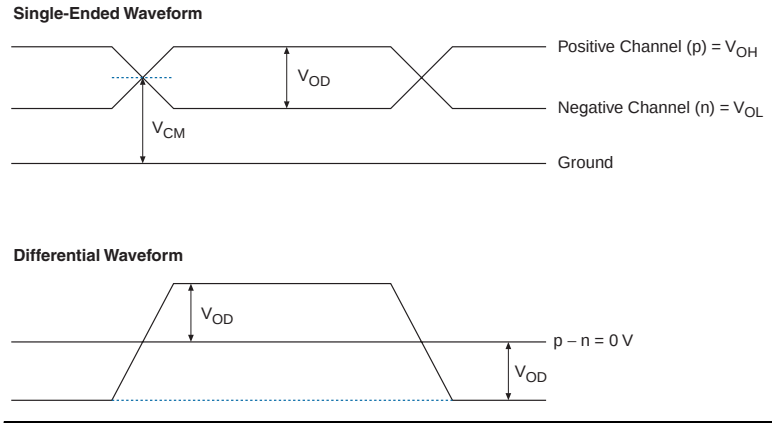
Power Sequencing & Hot Socketing

Because Stratix devices can be used in a mixed-voltage environment, they have been designed specifically to tolerate any possible power-up sequence. Therefore, the VCCIO and VCCINT power supplies may be powered in any order.

Although you can power up or down the VCCIO and VCCINT power supplies in any sequence, you should not power down any I/O banks that contain configuration pins while leaving other I/O banks powered on. For power up and power down, all supplies (VCCINT and all VCCIO power planes) must be powered up and down within 100 ms of each other. This prevents I/O pins from driving out.

Signals can be driven into Stratix devices before and during power up without damaging the device. In addition, Stratix devices do not drive out during power up. Once operating conditions are reached and the device is configured, Stratix devices operate as specified by the user. For more information, see *Hot Socketing* in the *Selectable I/O Standards in Stratix & Stratix GX Devices* chapter in the *Stratix Device Handbook, Volume 2*.

Figure 4–2. Transmitter Output Waveforms for Differential I/O Standards



Tables 4–10 through 4–33 recommend operating conditions, DC operating conditions, and capacitance for 1.5-V Stratix devices.

Table 4–10. 3.3-V LVDS I/O Specifications (Part 1 of 2)

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Unit
V_{CCIO}	I/O supply voltage		3.135	3.3	3.465	V
V_{ID} *(6)*	Input differential voltage swing (single-ended)	0.1 V ≤V_{CM} < 1.1 V *W* = 1 through 10	300		1,000	mV
		1.1 V ≤V_{CM} ≤1.6 V *W* = 1	200		1,000	mV
		1.1 V ≤V_{CM} ≤1.6 V *W* = 2 through10	100		1,000	mV
		1.6 V < V_{CM} ≤1.8 V *W* = 1 through 10	300		1,000	mV

Timing Model

The DirectDrive™ technology and MultiTrack™ interconnect ensure predictable performance, accurate simulation, and accurate timing analysis across all Stratix device densities and speed grades. This section describes and specifies the performance, internal, external, and PLL timing specifications.

All specifications are representative of worst-case supply voltage and junction temperature conditions.

Preliminary & Final Timing

Timing models can have either preliminary or final status. The Quartus II software issues an informational message during the design compilation if the timing models are preliminary. Table 4–35 shows the status of the Stratix device timing models.

Preliminary status means the timing model is subject to change. Initially, timing numbers are created using simulation results, process data, and other known parameters. These tests are used to make the preliminary numbers as close to the actual timing parameters as possible.

Final timing numbers are based on actual device operation and testing. These numbers reflect the actual performance of the device under worst-case voltage and junction temperature conditions.

Table 4–35. Stratix Device Timing Model Status

Device	Preliminary	Final
EP1S10		✓
EP1S20		✓
EP1S25		✓
EP1S30		✓
EP1S40		✓

Larger Designs	8-bit, 16-tap parallel FIR filter	58	0	4	141.26	133.49	114.88	100.28	MHz
	8-bit, 1,024-point FFT function	870	5	1	261.09	235.51	205.21	175.22	MHz

Notes to Table 4–36:

(1) These design performance numbers were obtained using the Quartus II software.
(2) Numbers not listed will be included in a future version of the data sheet.
(3) This application uses registered inputs and outputs.
(4) This application uses registered multiplier input and output stages within the DSP block.
(5) This application uses registered multiplier input, pipeline, and output stages within the DSP block.

Table 4–77. EP1S30 External I/O Timing on Row Pins Using Regional Clock Networks

Parameter	-5 Speed Grade		-6 Speed Grade		-7 Speed Grade		-8 Speed Grade		Unit
	Min	Max	Min	Max	Min	Max	Min	Max
