
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	683
Number of Gates	-
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	956-BBGA
Supplier Device Package	956-BGA (40x40)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=ep1s40b956c6n

Chapter Revision Dates

The chapters in this book, *Stratix Device Handbook, Volume 1*, were revised on the following dates. Where chapters or groups of chapters are available separately, part numbers are listed.

Chapter 1. Introduction
Revised: *July 2005*
Part number: *S51001-3.2*

Chapter 2. Stratix Architecture
Revised: *July 2005*
Part number: *S51002-3.2*

Chapter 3. Configuration & Testing
Revised: *July 2005*
Part number: *S51003-1.3*

Chapter 4. DC & Switching Characteristics
Revised: *January 2006*
Part number: *S51004-3.4*

Chapter 5. Reference & Ordering Information
Revised: *September 2004*
Part number: *S51005-2.1*

Dynamic Arithmetic Mode

The dynamic arithmetic mode is ideal for implementing adders, counters, accumulators, wide parity functions, and comparators. An LE in dynamic arithmetic mode uses four 2-input LUTs configurable as a dynamic adder/subtractor. The first two 2-input LUTs compute two summations based on a possible carry-in of 1 or 0; the other two LUTs generate carry outputs for the two chains of the carry select circuitry. As shown in Figure 2–7, the LAB carry-in signal selects either the `carry-in0` or `carry-in1` chain. The selected chain's logic level in turn determines which parallel sum is generated as a combinatorial or registered output. For example, when implementing an adder, the sum output is the selection of two possible calculated sums: `data1` + `data2` + `carry-in0` or `data1` + `data2` + `carry-in1`. The other two LUTs use the `data1` and `data2` signals to generate two possible carry-out signals—one for a carry of 1 and the other for a carry of 0. The `carry-in0` signal acts as the carry select for the `carry-out0` output and `carry-in1` acts as the carry select for the `carry-out1` output. LEs in arithmetic mode can drive out registered and unregistered versions of the LUT output.

The dynamic arithmetic mode also offers clock enable, counter enable, synchronous up/down control, synchronous clear, synchronous load, and dynamic adder/subtractor options. The LAB local interconnect data inputs generate the counter enable and synchronous up/down control signals. The synchronous clear and synchronous load options are LAB-wide signals that affect all registers in the LAB. The Quartus II software automatically places any registers that are not used by the counter into other LABs. The `addnsub` LAB-wide signal controls whether the LE acts as an adder or subtractor.

M512 RAM blocks can have different clocks on its inputs and outputs. The wren, datain, and write address registers are all clocked together from one of the two clocks feeding the block. The read address, rden, and output registers can be clocked by either of the two clocks driving the block. This allows the RAM block to operate in read/write or input/output clock modes. Only the output register can be bypassed. The eight labclk signals or local interconnect can drive the inclock, outclock, wren, rden, inclr, and outclr signals. Because of the advanced interconnect between the LAB and M512 RAM blocks, LEs can also control the wren and rden signals and the RAM clock, clock enable, and asynchronous clear signals. Figure 2–15 shows the M512 RAM block control signal generation logic.

The RAM blocks within Stratix devices have local interconnects to allow LEs and interconnects to drive into RAM blocks. The M512 RAM block local interconnect is driven by the R4, R8, C4, C8, and direct link interconnects from adjacent LABs. The M512 RAM blocks can communicate with LABs on either the left or right side through these row interconnects or with LAB columns on the left or right side with the column interconnects. Up to 10 direct link input connections to the M512 RAM block are possible from the left adjacent LABs and another 10 possible from the right adjacent LAB. M512 RAM outputs can also connect to left and right LABs through 10 direct link interconnects. The M512 RAM block has equal opportunity for access and performance to and from LABs on either its left or right side. Figure 2–16 shows the M512 RAM block to logic array interface.

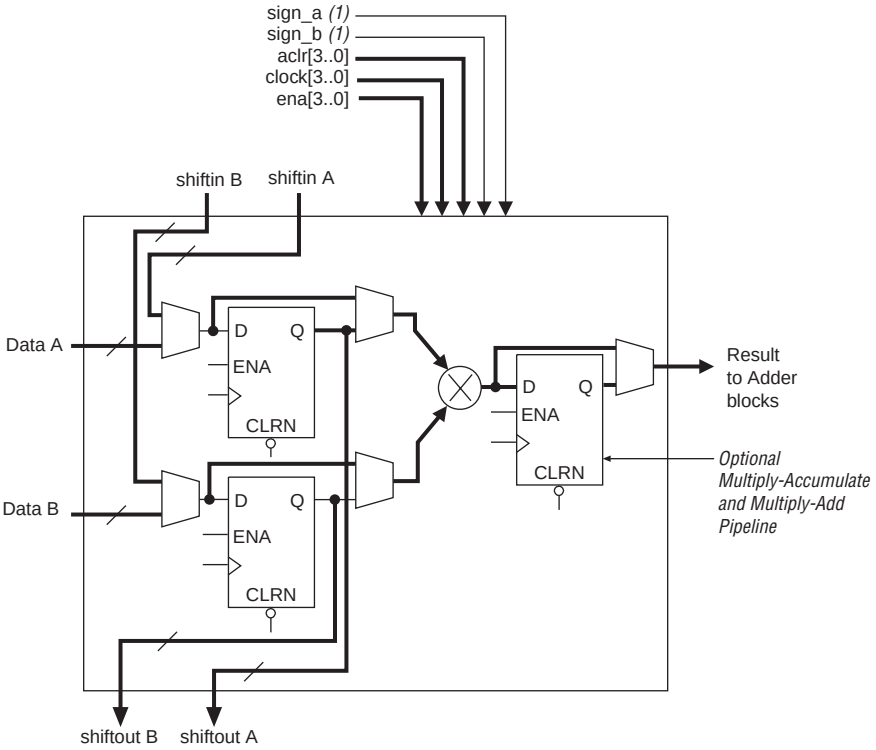
The DSP block consists of the following elements:

- Multiplier block
- Adder/output block

Multiplier Block

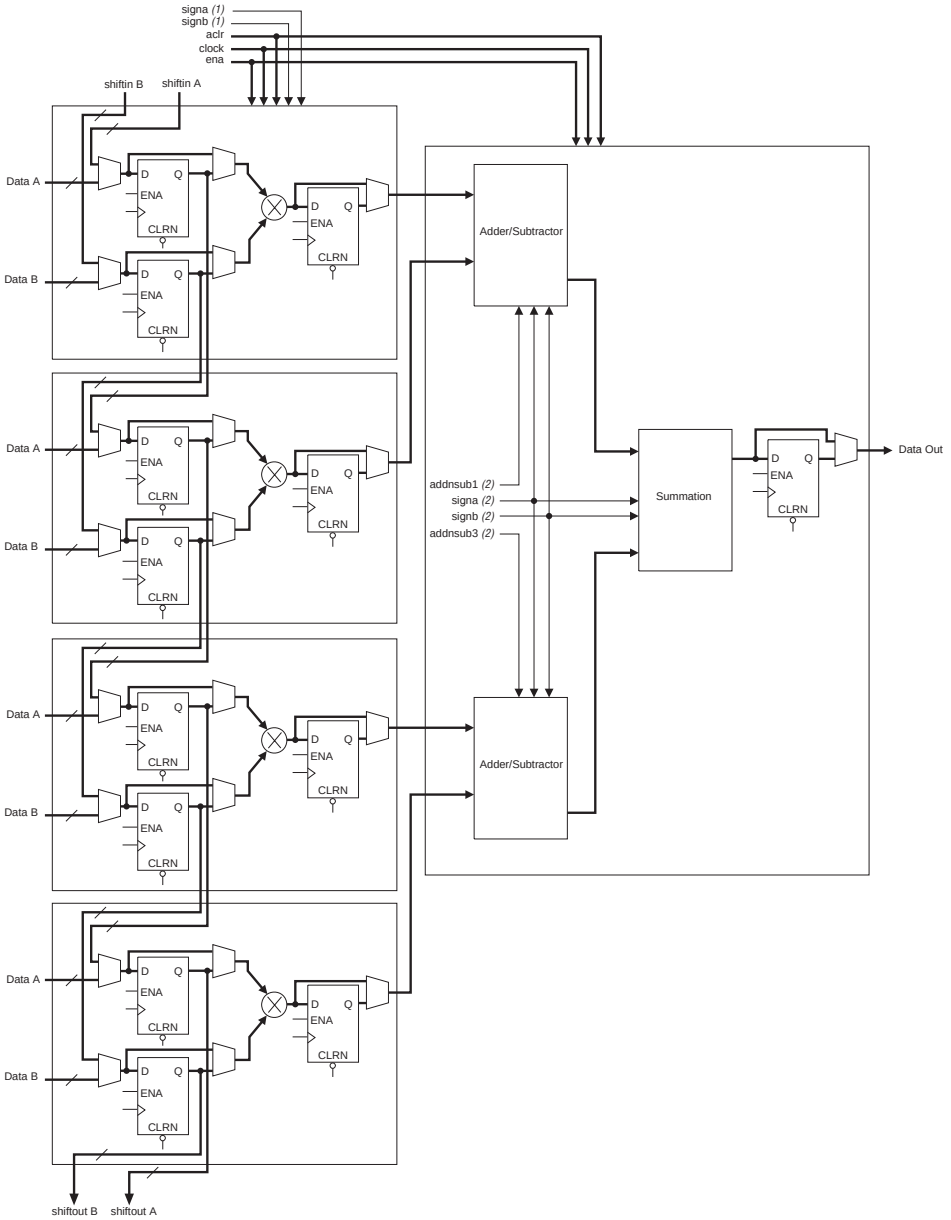
The DSP block multiplier block consists of the input registers, a multiplier, and pipeline register for pipelining multiply-accumulate and multiply-add/subtract functions as shown in Figure 2–32.

Figure 2–32. Multiplier Sub-Block within Stratix DSP Block



Note to Figure 2–32:
(1) These signals can be unregistered or registered once to match data path pipelines if required.

Figure 2–39. Four-Multipliers Adder Mode

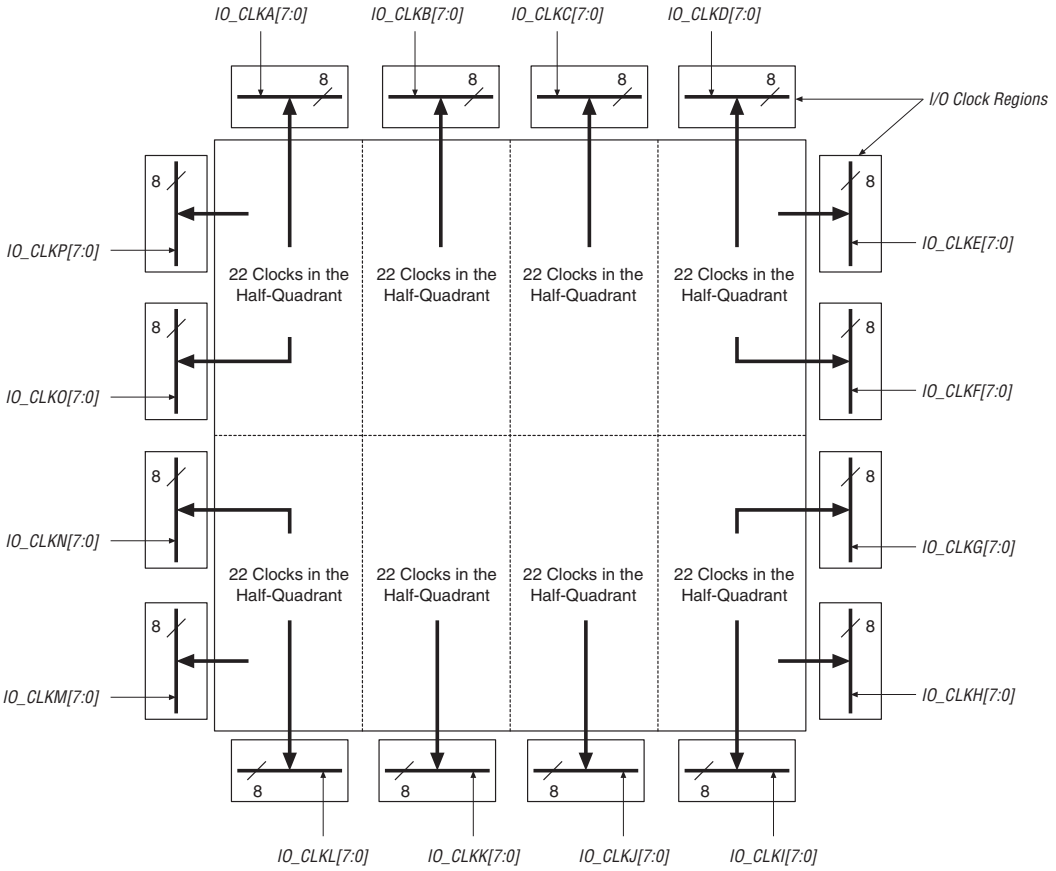


Notes to Figure 2–39:

(1) These signals are not registered or registered once to match the data path pipeline.

(2) These signals are not registered, registered once, or registered twice for latency to match the data path pipeline.

Figure 2–48. EP1S30, EP1S40, EP1S60, EP1S80 Device I/O Clock Groups



You can use the Quartus II software to control whether a clock input pin is either global, regional, or fast regional. The Quartus II software automatically selects the clocking resources if not specified.

Enhanced & Fast PLLs

Stratix devices provide robust clock management and synthesis using up to four enhanced PLLs and eight fast PLLs. These PLLs increase performance and provide advanced clock interfacing and clock-frequency synthesis. With features such as clock switchover, spread spectrum clocking, programmable bandwidth, phase and delay control, and PLL reconfiguration, the Stratix device's enhanced PLLs provide you with complete control of your clocks and system timing. The fast PLLs

Table 2–22. Fast PLL Port I/O Standards (Part 2 of 2)		
I/O Standard	Input	
	INCLK	PLLENABLE
SSTL-2 Class II	✓	
SSTL-3 Class I	✓	
SSTL-3 Class II	✓	
AGP (1× and 2×)		
CTT	✓	

Table 2–23 shows the performance on each of the fast PLL clock inputs when using LVDS, LVPECL, 3.3-V PCML, or HyperTransport technology.

Table 2–23. LVDS Performance on Fast PLL Input	
Fast PLL Clock Input	Maximum Input Frequency (MHz)
CLK0, CLK2, CLK9, CLK11, FPLL7CLK, FPLL8CLK, FPLL9CLK, FPLL10CLK	717 *(1)*
CLK1, CLK3, CLK8, CLK10	645

Note to Table 2–23:

(1) See the chapter *DC & Switching Characteristics* of the *Stratix Device Handbook, Volume 1* for more information.

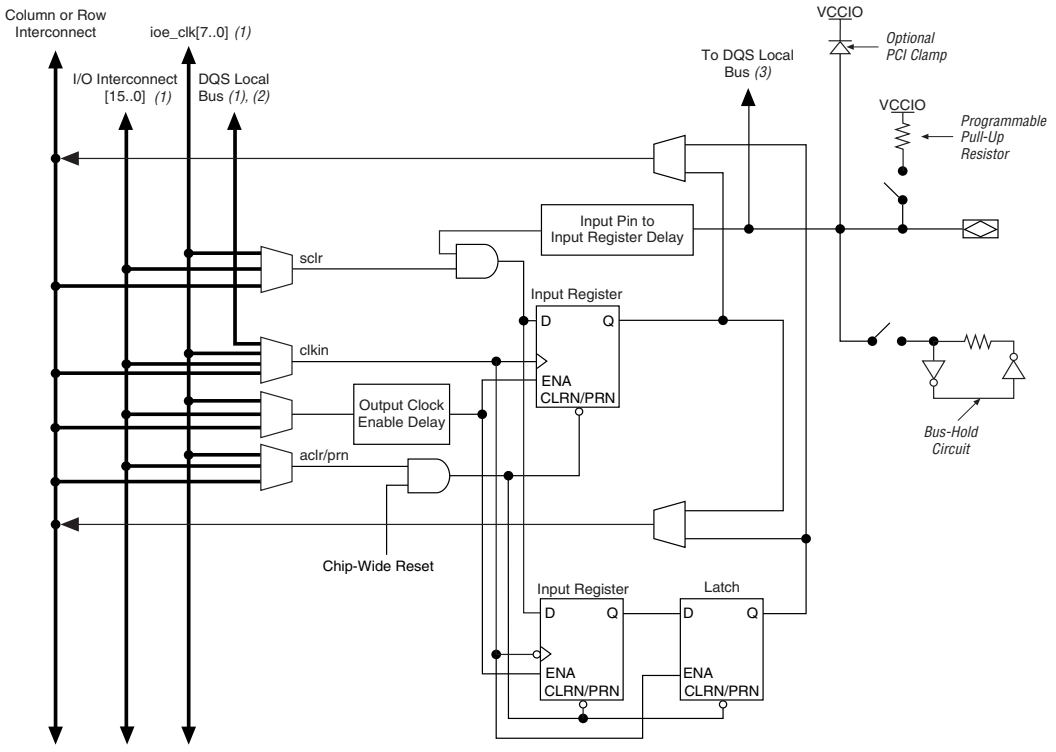
External Clock Outputs

Each fast PLL supports differential or single-ended outputs for source-synchronous transmitters or for general-purpose external clocks. There are no dedicated external clock output pins. Any I/O pin can be driven by the fast PLL global or regional outputs as an external output pin. The I/O standards supported by any particular bank determines what standards are possible for an external clock output driven by the fast PLL in that bank.

Phase Shifting

Stratix device fast PLLs have advanced clock shift capability that enables programmable phase shifts. You can enter a phase shift (in degrees or time units) for each PLL clock output port or for all outputs together in one shift. You can perform phase shifting in time units with a resolution range of 125 to 416.66 ps. This resolution is a function of the VCO period, with the finest step being equal to an eighth (×0.125) of the VCO period.

Figure 2–65. Stratix IOE in DDR Input I/O Configuration Note (1)



Notes to Figure 2–65:

(1) All input signals to the IOE can be inverted at the IOE.
(2) This signal connection is only allowed on dedicated DQ function pins.
(3) This signal is for dedicated DQS function pins only.

For Stratix, the CRC is computed by the Quartus II software and downloaded into the device as a part of the configuration bit stream. The CRC_ERROR pin reports a soft error when configuration SRAM data is corrupted, triggering device reconfiguration.

Custom-Built Circuitry

Dedicated circuitry is built in the Stratix devices to perform error detection automatically. You can use the built-in dedicated circuitry for error detection using CRC feature in Stratix devices, eliminating the need for external logic. This circuitry will perform error detection automatically when enabled. This error detection circuitry in Stratix devices constantly checks for errors in the configuration SRAM cells while the device is in user mode. You can monitor one external pin for the error and use it to trigger a re-configuration cycle. Select the desired time between checks by adjusting a built-in clock divider.

Software Interface

In the Quartus II software version 4.1 and later, you can turn on the automated error detection CRC feature in the **Device & Pin Options** dialog box. This dialog box allows you to enable the feature and set the internal frequency of the CRC between 400 kHz to 100 MHz. This controls the rate that the CRC circuitry verifies the internal configuration SRAM bits in the FPGA device.

For more information on CRC, see *AN 357: Error Detection Using CRC in Altera FPGA Devices*.

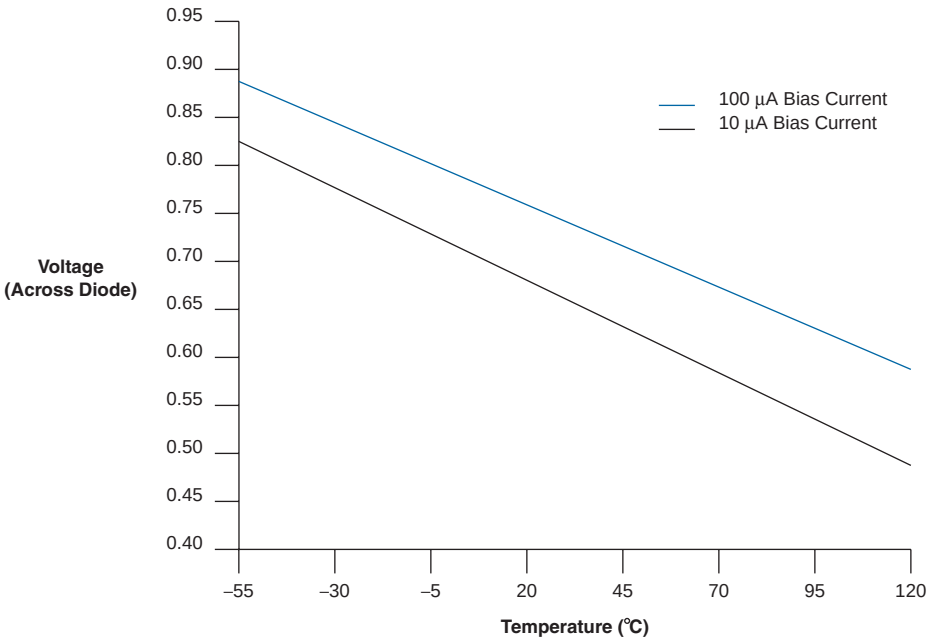
Temperature Sensing Diode

Stratix devices include a diode-connected transistor for use as a temperature sensor in power management. This diode is used with an external digital thermometer device such as a MAX1617A or MAX1619 from MAXIM Integrated Products. These devices steer bias current through the Stratix diode, measuring forward voltage and converting this reading to temperature in the form of an 8-bit signed number (7 bits plus sign). The external device's output represents the junction temperature of the Stratix device and can be used for intelligent power management.

The diode requires two pins (tempdiodep and tempdioden) on the Stratix device to connect to the external temperature-sensing device, as shown in Figure 3–5. The temperature sensing diode is a passive element and therefore can be used before the Stratix device is powered.

The temperature-sensing diode works for the entire operating range shown in Figure 3–6.

Figure 3–6. Temperature vs. Temperature-Sensing Diode Voltage



device. Decoupling capacitors were not used in this measurement. To factor in the current for decoupling capacitors, sum up the current for each capacitor using the following equation:

$I = C (dV/dt)$

If the regulator or power supply minimum output current is more than the Stratix device requires, then the device may consume more current than the maximum current listed in Table 4–34. However, the device does not require any more current to successfully power up than what is listed in Table 4–34.

Table 4–34. Stratix Power-Up Current (I_{CCINT}) Requirements Note (1)

Device	Power-Up Current Requirement		Unit
	Typical	Maximum	
EP1S10	250	700	mA
EP1S20	400	1,200	mA
EP1S25	500	1,500	mA
EP1S30	550	1,900	mA
EP1S40	650	2,300	mA
EP1S60	800	2,600	mA
EP1S80	1,000	3,000	mA

Note to Table 4–34:

(1) The maximum test conditions are for 0° C and typical test conditions are for 40° C.

The exact amount of current consumed varies according to the process, temperature, and power ramp rate. Stratix devices typically require less current during power up than shown in Table 4–34. The user-mode current during device operation is generally higher than the power-up current.

The duration of the I_{CCINT} power-up requirement depends on the V_{CCINT} voltage supply rise time. The power-up current consumption drops when the V_{CCINT} supply reaches approximately 0.75 V.

Internal Timing Parameters

Internal timing parameters are specified on a speed grade basis independent of device density. Tables 4–37 through 4–42 describe the Stratix device internal timing microparameters for LEs, IOEs, TriMatrix™ memory structures, DSP blocks, and MultiTrack interconnects.

Table 4–37. LE Internal Timing Microparameter Descriptions

Symbol	Parameter
t_{SU}	LE register setup time before clock
t_{H}	LE register hold time after clock
t_{CO}	LE register clock-to-output delay
t_{LUT}	LE combinatorial LUT delay for data-in to data-out
t_{CLR}	Minimum clear pulse width
t_{PRE}	Minimum preset pulse width
t_{CLKHL}	Register minimum clock high or low time. The maximum core clock frequency can be calculated by $1/(2 \times t_{CLKHL})$.

Table 4–38. IOE Internal Timing Microparameter Descriptions

Symbol	Parameter
t_{SU_R}	Row IOE input register setup time
t_{SU_C}	Column IOE input register setup time
t_{H}	IOE input and output register hold time after clock
t_{CO_R}	Row IOE input and output register clock-to-output delay
t_{CO_C}	Column IOE input and output register clock-to-output delay
$t_{PIN2COMBOUT\_R}$	Row input pin to IOE combinatorial output
$t_{PIN2COMBOUT\_C}$	Column input pin to IOE combinatorial output
$t_{COMBIN2PIN\_R}$	Row IOE data input to combinatorial output pin
$t_{COMBIN2PIN\_C}$	Column IOE data input to combinatorial output pin
t_{CLR}	Minimum clear pulse width
t_{PRE}	Minimum preset pulse width
t_{CLKHL}	Register minimum clock high or low time. The maximum I/O clock frequency can be calculated by $1/(2 \times t_{CLKHL})$. Performance may also be affected by I/O timing, use of PLL, and I/O programmable settings.

Table 4–47. DSP Block Internal Timing Microparameters (Part 2 of 2)

Symbol	-5		-6		-7		-8		Unit
	Min	Max	Min	Max	Min	Max	Min	Max	
$t_{PIPE2OUTREG2ADD}$		2,002		2,203		2,533		2,980	ps

Table 4–52 shows the external I/O timing parameters when using fast regional clock networks.

Table 4–52. Stratix Fast Regional Clock External I/O Timing Parameters Notes (1), (2)

Symbol	Parameter
t_{INSU}	Setup time for input or bidirectional pin using IOE input register with fast regional clock fed by FCLK pin
t_{INH}	Hold time for input or bidirectional pin using IOE input register with fast regional clock fed by FCLK pin
t_{OUTCO}	Clock-to-output delay output or bidirectional pin using IOE output register with fast regional clock fed by FCLK pin
t_{XZ}	Synchronous IOE output enable register to output pin disable delay using fast regional clock fed by FCLK pin
t_{ZX}	Synchronous IOE output enable register to output pin enable delay using fast regional clock fed by FCLK pin

Notes to Table 4–52:
(1) These timing parameters are sample-tested only.
(2) These timing parameters are for column and row IOE pins. You should use the Quartus II software to verify the external timing for any pin.

Table 4–53 shows the external I/O timing parameters when using regional clock networks.

Table 4–53. Stratix Regional Clock External I/O Timing Parameters (Part 1 of 2) Notes (1), (2)

Symbol	Parameter
t_{INSU}	Setup time for input or bidirectional pin using IOE input register with regional clock fed by CLK pin
t_{INH}	Hold time for input or bidirectional pin using IOE input register with regional clock fed by CLK pin
t_{OUTCO}	Clock-to-output delay output or bidirectional pin using IOE output register with regional clock fed by CLK pin
$t_{INSUPLL}$	Setup time for input or bidirectional pin using IOE input register with regional clock fed by Enhanced PLL with default phase setting
t_{INHPLL}	Hold time for input or bidirectional pin using IOE input register with regional clock fed by Enhanced PLL with default phase setting
$t_{OUTCOPLL}$	Clock-to-output delay output or bidirectional pin using IOE output register with regional clock Enhanced PLL with default phase setting
