
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	773
Number of Gates	-
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	1020-BBGA
Supplier Device Package	1020-FBGA (33x33)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=ep1s80f1020c7

Chapter	Date/Version	Changes Made
4	October 2003, v2.1	• Added -8 speed grade information. • Updated performance information in Table 4–36. • Updated timing information in Tables 4–55 through 4–96. • Updated delay information in Tables 4–103 through 4–108. • Updated programmable delay information in Tables 4–100 and 4–103.
	July 2003, v2.0	• Updated clock rates in Tables 4–114 through 4–123. • Updated speed grade information in the introduction on page 4-1. • Corrected figures 4-1 & 4-2 and Table 4-9 to reflect how VID and VOD are specified. • Added note 6 to Table 4-32. • Updated Stratix Performance Table 4-35. • Updated EP1S60 and EP1S80 timing parameters in Tables 4-82 to 4-93. The Stratix timing models are final for all devices. • Updated Stratix IOE programmable delay chains in Tables 4-100 to 4-101. • Added single-ended I/O standard output pin delay adders for loading in Table 4-102. • Added spec for FPLL[10..7]CLK pins in Tables 4-104 and 4-107. • Updated high-speed I/O specification for J=2 in Tables 4-114 and 4-115. • Updated EPLL specification and fast PLL specification in Tables 4-116 to 4-120.
5	September 2004, v2.1	• Updated reference to device pin-outs on page 5–1 to indicate that device pin-outs are no longer included in this manual and are now available on the Altera web site.
	April 2003, v1.0	• No new changes in Stratix Device Handbook v2.0.

functions. Another special packing mode allows the register output to feed back into the LUT of the same LE so that the register is packed with its own fan-out LUT. This provides another mechanism for improved fitting. The LE can also drive out registered and unregistered versions of the LUT output.

LUT Chain & Register Chain

In addition to the three general routing outputs, the LEs within an LAB have LUT chain and register chain outputs. LUT chain connections allow LUTs within the same LAB to cascade together for wide input functions. Register chain outputs allow registers within the same LAB to cascade together. The register chain output allows an LAB to use LUTs for a single combinatorial function and the registers to be used for an unrelated shift register implementation. These resources speed up connections between LABs while saving local interconnect resources. See "MultiTrack Interconnect" on page 2–14 for more information on LUT chain and register chain connections.

addnsub Signal

The LE's dynamic adder/subtractor feature saves logic resources by using one set of LEs to implement both an adder and a subtractor. This feature is controlled by the LAB-wide control signal `addnsub`. The `addnsub` signal sets the LAB to perform either A + B or A – B. The LUT computes addition, and subtraction is computed by adding the two's complement of the intended subtractor. The LAB-wide signal converts to two's complement by inverting the B bits within the LAB and setting carry-in = 1 to add one to the least significant bit (LSB). The LSB of an adder/subtractor must be placed in the first LE of the LAB, where the LAB-wide `addnsub` signal automatically sets the carry-in to 1. The Quartus II Compiler automatically places and uses the adder/subtractor feature when using adder/subtractor parameterized functions.

LE Operating Modes

The Stratix LE can operate in one of the following modes:

- Normal mode
- Dynamic arithmetic mode

Each mode uses LE resources differently. In each mode, eight available inputs to the LE—the four data inputs from the LAB local interconnect; `carry-in0` and `carry-in1` from the previous LE; the LAB carry-in from the previous carry-chain LAB; and the register chain connection—are directed to different destinations to implement the desired logic function. LAB-wide signals provide clock, asynchronous clear,

can drive other R8 interconnects to extend their range as well as C8 interconnects for row-to-row connections. One R8 interconnect is faster than two R4 interconnects connected together.

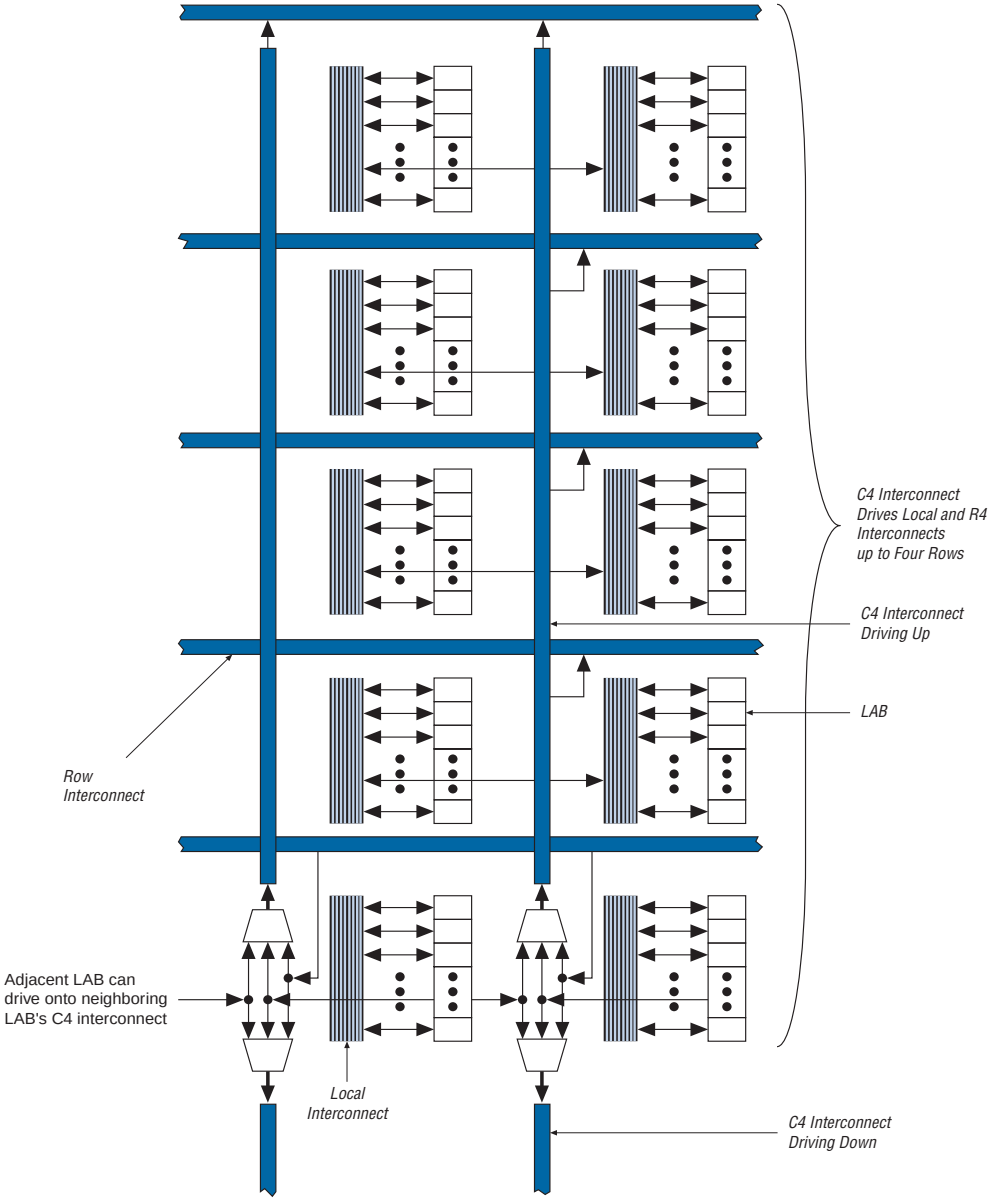
R24 row interconnects span 24 LABs and provide the fastest resource for long row connections between LABs, TriMatrix memory, DSP blocks, and IOEs. The R24 row interconnects can cross M-RAM blocks. R24 row interconnects drive to other row or column interconnects at every fourth LAB and do not drive directly to LAB local interconnects. R24 row interconnects drive LAB local interconnects via R4 and C4 interconnects. R24 interconnects can drive R24, R4, C16, and C4 interconnects.

The column interconnect operates similarly to the row interconnect and vertically routes signals to and from LABs, TriMatrix memory, DSP blocks, and IOEs. Each column of LABs is served by a dedicated column interconnect, which vertically routes signals to and from LABs, TriMatrix memory and DSP blocks, and horizontal IOEs. These column resources include:

- LUT chain interconnects within an LAB
- Register chain interconnects within an LAB
- C4 interconnects traversing a distance of four blocks in up and down direction
- C8 interconnects traversing a distance of eight blocks in up and down direction
- C16 column interconnects for high-speed vertical routing through the device

Stratix devices include an enhanced interconnect structure within LABs for routing LE output to LE input connections faster using LUT chain connections and register chain connections. The LUT chain connection allows the combinatorial output of an LE to directly drive the fast input of the LE right below it, bypassing the local interconnect. These resources can be used as a high-speed connection for wide fan-in functions from LE 1 to LE 10 in the same LAB. The register chain connection allows the register output of one LE to connect directly to the register input of the next LE in the LAB for fast shift registers. The Quartus II Compiler automatically takes advantage of these resources to improve utilization and performance. Figure 2–10 shows the LUT chain and register chain interconnects.

Figure 2–11. C4 Interconnect Connections Note (1)



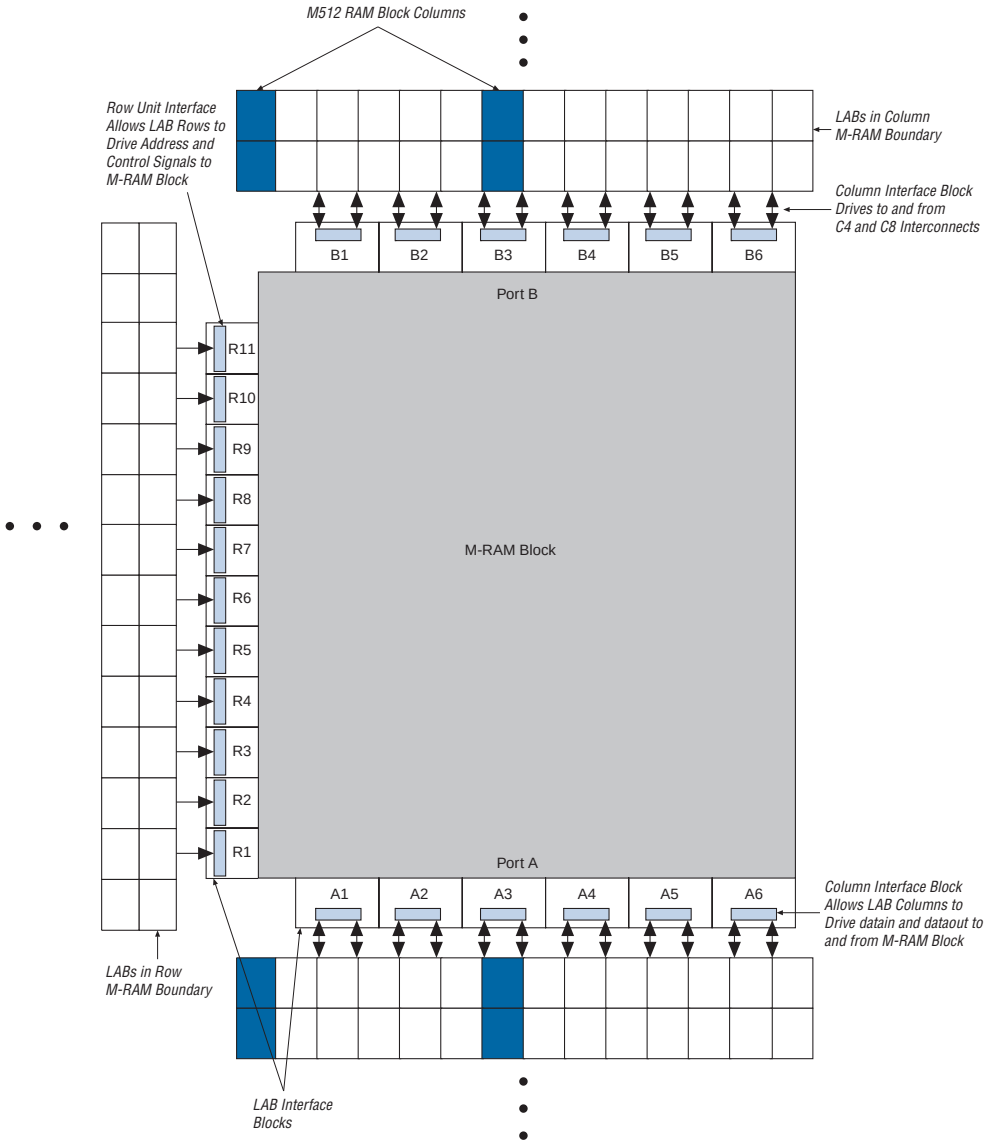
Note to Figure 2–11:
(1) Each C4 interconnect can drive either up or down four rows.

C8 interconnects span eight LABs, M512, or M4K blocks up or down from a source LAB. Every LAB has its own set of C8 interconnects to drive either up or down. C8 interconnect connections between the LABs in a column are similar to the C4 connections shown in Figure 2–11 with the exception that they connect to eight LABs above and below. The C8 interconnects can drive and be driven by all types of architecture blocks similar to C4 interconnects. C8 interconnects can drive each other to extend their range as well as R8 interconnects for column-to-column connections. C8 interconnects are faster than two C4 interconnects.

C16 column interconnects span a length of 16 LABs and provide the fastest resource for long column connections between LABs, TriMatrix memory blocks, DSP blocks, and IOEs. C16 interconnects can cross M-RAM blocks and also drive to row and column interconnects at every fourth LAB. C16 interconnects drive LAB local interconnects via C4 and R4 interconnects and do not drive LAB local interconnects directly.

All embedded blocks communicate with the logic array similar to LAB-to-LAB interfaces. Each block (i.e., TriMatrix memory and DSP blocks) connects to row and column interconnects and has local interconnect regions driven by row and column interconnects. These blocks also have direct link interconnects for fast connections to and from a neighboring LAB. All blocks are fed by the row LAB clocks, `labclk[7..0]`.

Figure 2–21. Left-Facing M-RAM to Interconnect Interface Notes (1), (2)

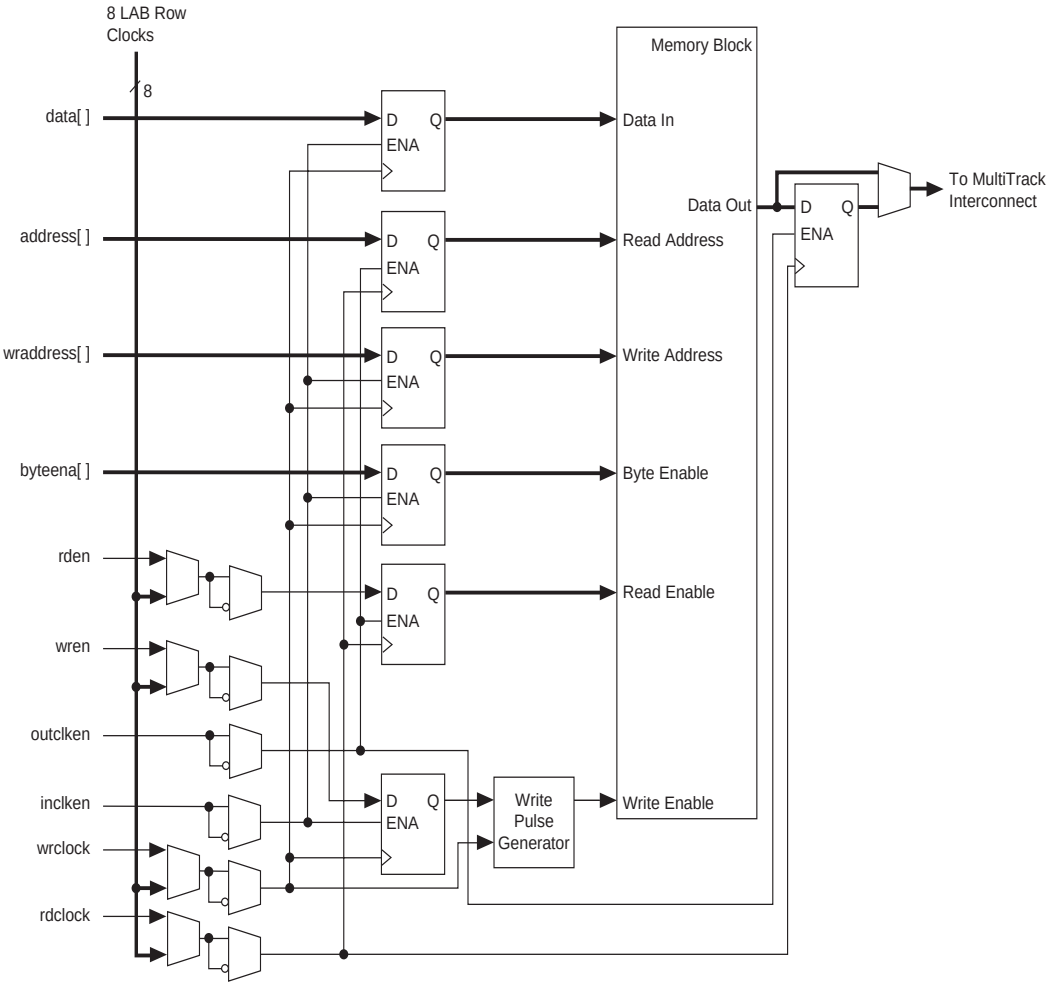


Notes to Figure 2–21:

(1) Only R24 and C16 interconnects cross the M-RAM block boundaries.

(2) The right-facing M-RAM block has interface blocks on the right side, but none on the left. B1 to B6 and A1 to A6 orientation is clipped across the vertical axis for right-facing M-RAM blocks.

Figure 2–27. Read/Write Clock Mode in Simple Dual-Port Mode Notes (1), (2)

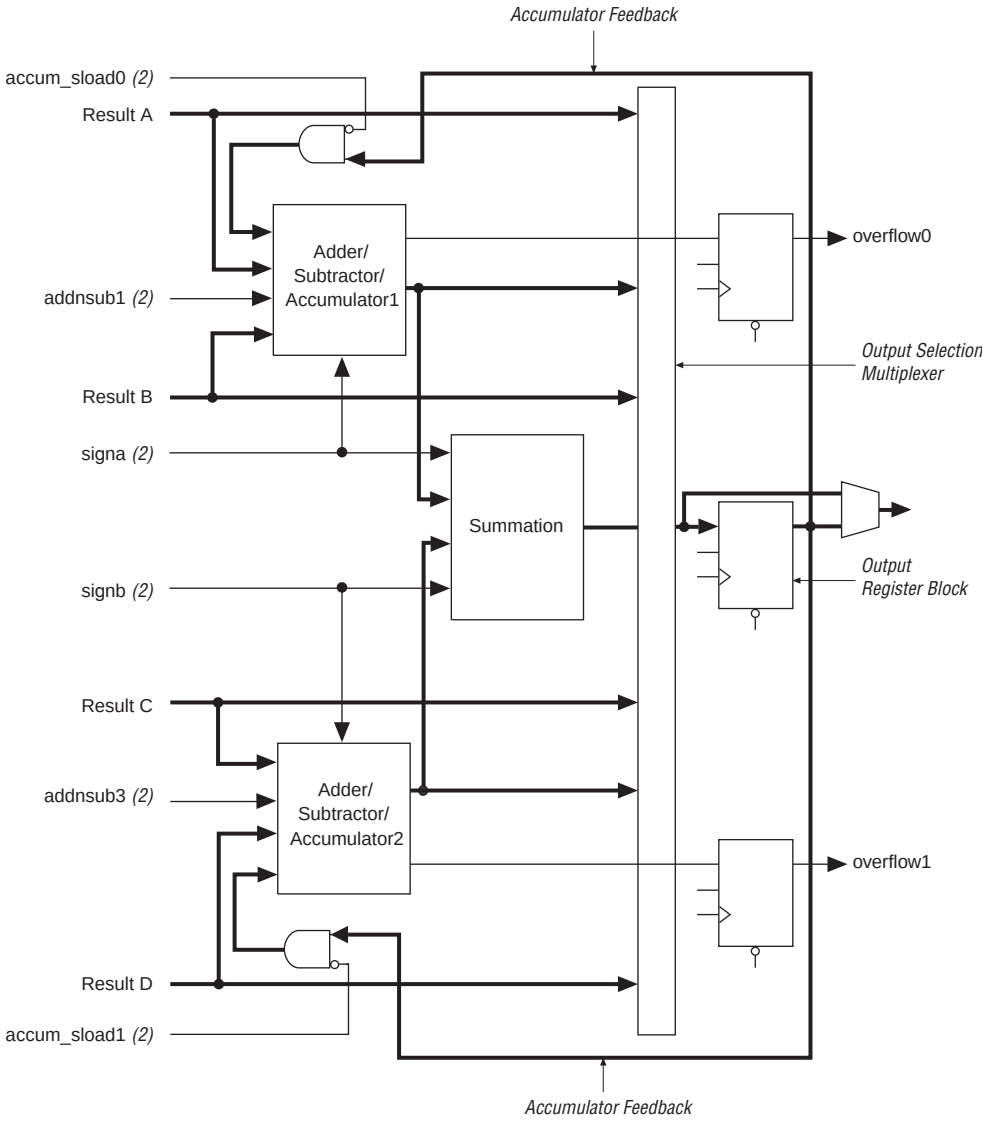


Notes to Figure 2–27:

(1) All registers shown except the `rden` register have asynchronous clear ports.

(2) Violating the setup or hold time on the address registers could corrupt the memory contents. This applies to both read and write operations.

Figure 2–34. Adder/Output Blocks *Note (1)*

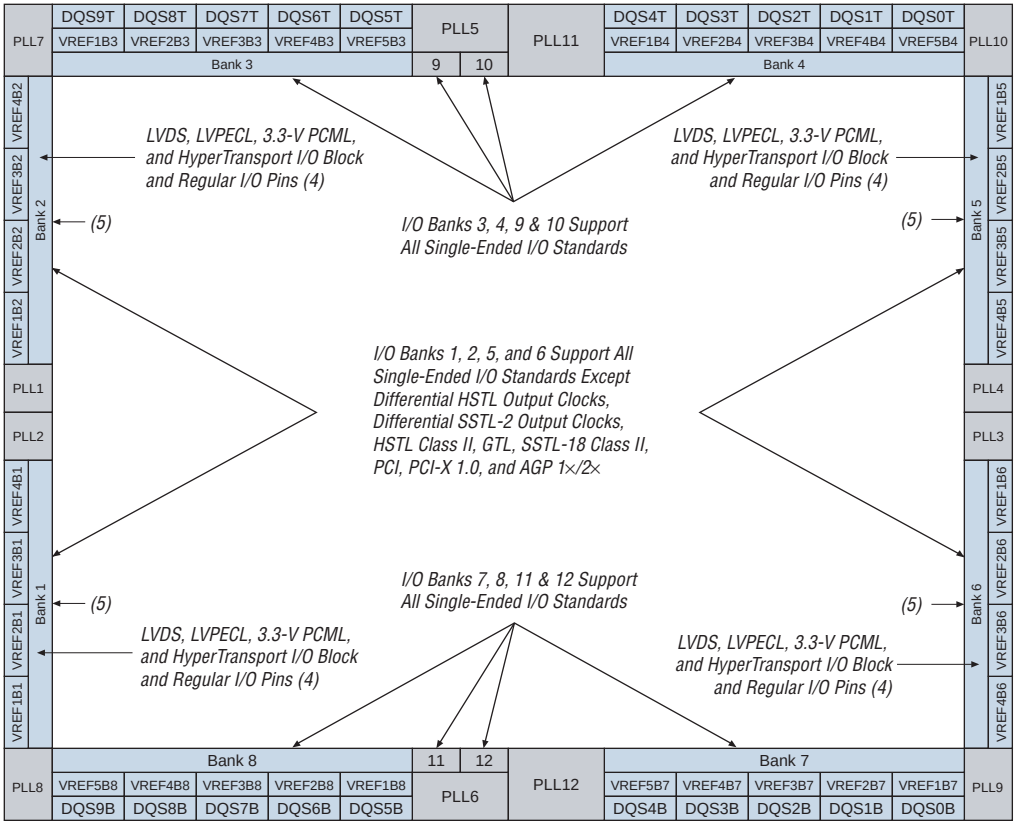


Notes to Figure 2–34:

(1) Adder/output block shown in Figure 2–34 is in 18 × 18-bit mode. In 9 × 9-bit mode, there are four adder/subtractor blocks and two summation blocks.

(2) These signals are either not registered, registered once, or registered twice to match the data path pipeline.

Figure 2–70. Stratix I/O Banks *Notes (1), (2), (3)*



Notes to Figure 2–70:

(1) Figure 2–70 is a top view of the silicon die. This will correspond to a top-down view for non-flip-chip packages, but will be a reverse view for flip-chip packages.

(2) Figure 2–70 is a graphic representation only. See the device pin-outs on the web (**www.altera.com**) and the Quartus II software for exact locations.

(3) Banks 9 through 12 are enhanced PLL external clock output banks.

(4) If the high-speed differential I/O pins are not used for high-speed differential signaling, they can support all of the I/O standards except HSTL Class I and II, GTL, SSTL-18 Class II, PCI, PCI-X 1.0, and AGP 1× /2×.

(5) For guidelines for placing single-ended I/O pads next to differential I/O pads, see the *Selectable I/O Standards in Stratix and Stratix GX Devices* chapter in the *Stratix Device Handbook, Volume 2*.

Table 2–32. I/O Support by Bank (Part 2 of 2)

I/O Standard	Top & Bottom Banks (3, 4, 7 & 8)	Left & Right Banks (1, 2, 5 & 6)	Enhanced PLL External Clock Output Banks (9, 10, 11 & 12)
SSTL-3 Class II	✓	✓	✓
AGP (1× and 2×)	✓		✓
CTT	✓	✓	✓

Each I/O bank has its own VCCIO pins. A single device can support 1.5-, 1.8-, 2.5-, and 3.3-V interfaces; each bank can support a different standard independently. Each bank also has dedicated VREF pins to support any one of the voltage-referenced standards (such as SSTL-3) independently.

Each I/O bank can support multiple standards with the same V_{CCIO} for input and output pins. Each bank can support one voltage-referenced I/O standard. For example, when V_{CCIO} is 3.3 V, a bank can support LVTTL, LVCMOS, 3.3-V PCI, and SSTL-3 for inputs and outputs.

Differential On-Chip Termination

Stratix devices provide differential on-chip termination (LVDS I/O standard) to reduce reflections and maintain signal integrity. Differential on-chip termination simplifies board design by minimizing the number of external termination resistors required. Termination can be placed inside the package, eliminating small stubs that can still lead to reflections. The internal termination is designed using transistors in the linear region of operation.

Stratix devices support internal differential termination with a nominal resistance value of 137.5 Ω for LVDS input receiver buffers. LVPECL signals require an external termination resistor. Figure 2–71 shows the device with differential termination.

Table 2–40. EP1S60 Differential Channels (Part 2 of 2) Note (1)

3. Configuration & Testing

S51003-1.3

IEEE Std. 1149.1 (JTAG) Boundary-Scan Support

All Stratix® devices provide JTAG BST circuitry that complies with the IEEE Std. 1149.1a-1990 specification. JTAG boundary-scan testing can be performed either before or after, but not during configuration. Stratix devices can also use the JTAG port for configuration together with either the Quartus® II software or hardware using either Jam Files (**.jam**) or Jam Byte-Code Files (**.jbc**).

Stratix devices support IOE I/O standard setting reconfiguration through the JTAG BST chain. The JTAG chain can update the I/O standard for all input and output pins any time before or during user mode through the `CONFIG_IO` instruction. You can use this ability for JTAG testing before configuration when some of the Stratix pins drive or receive from other devices on the board using voltage-referenced standards. Since the Stratix device may not be configured before JTAG testing, the I/O pins may not be configured for appropriate electrical standards for chip-to-chip communication. Programming those I/O standards via JTAG allows you to fully test the I/O connection to other devices.

The enhanced PLL reconfiguration bits are part of the JTAG chain before configuration and after power-up. After device configuration, the PLL reconfiguration bits are not part of the JTAG chain.

The JTAG pins support 1.5-V/1.8-V or 2.5-V/3.3-V I/O standards. The `TDO` pin voltage is determined by the V_{CCIO} of the bank where it resides. The `VCCSEL` pin selects whether the JTAG inputs are 1.5-V, 1.8-V, 2.5-V, or 3.3-V compatible.

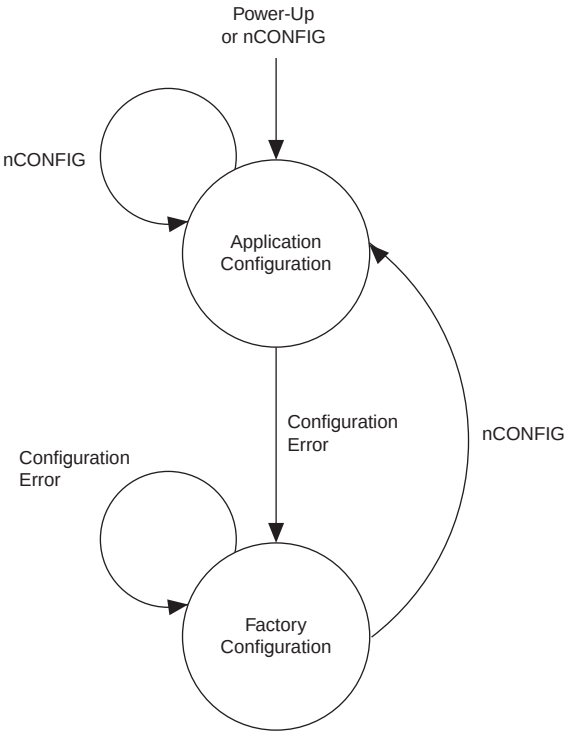
Stratix devices also use the JTAG port to monitor the logic operation of the device with the SignalTap® II embedded logic analyzer. Stratix devices support the JTAG instructions shown in Table 3–1.

The Quartus II software has an Auto Usercode feature where you can choose to use the checksum value of a programming file as the JTAG user code. If selected, the checksum is automatically loaded to the `USERCODE` register. In the Settings dialog box in the Assignments menu, click **Device & Pin Options**, then **General,** and then turn on the **Auto Usercode** option.

Local Update Mode

Local update mode is a simplified version of the remote update. This feature is intended for simple systems that need to load a single application configuration immediately upon power up without loading the factory configuration first. Local update designs have only one application configuration to load, so it does not require a factory configuration to determine which application configuration to use. Figure 3–4 shows the transition diagram for local update mode.

Figure 3–4. Local Update Transition Diagram



Stratix Automated Single Event Upset (SEU) Detection

Stratix devices offer on-chip circuitry for automated checking of single event upset (SEU) detection. FPGA devices that operate at high elevations or in close proximity to earth's North or South Pole require periodic checks to ensure continued data integrity. The error detection cyclic redundancy check (CRC) feature controlled by the **Device & Pin Options** dialog box in the Quartus II software uses a 32-bit CRC circuit to ensure data reliability and is one of the best options for mitigating SEU.

For Stratix, the CRC is computed by the Quartus II software and downloaded into the device as a part of the configuration bit stream. The CRC_ERROR pin reports a soft error when configuration SRAM data is corrupted, triggering device reconfiguration.

Custom-Built Circuitry

Dedicated circuitry is built in the Stratix devices to perform error detection automatically. You can use the built-in dedicated circuitry for error detection using CRC feature in Stratix devices, eliminating the need for external logic. This circuitry will perform error detection automatically when enabled. This error detection circuitry in Stratix devices constantly checks for errors in the configuration SRAM cells while the device is in user mode. You can monitor one external pin for the error and use it to trigger a re-configuration cycle. Select the desired time between checks by adjusting a built-in clock divider.

Software Interface

In the Quartus II software version 4.1 and later, you can turn on the automated error detection CRC feature in the **Device & Pin Options** dialog box. This dialog box allows you to enable the feature and set the internal frequency of the CRC between 400 kHz to 100 MHz. This controls the rate that the CRC circuitry verifies the internal configuration SRAM bits in the FPGA device.

For more information on CRC, see *AN 357: Error Detection Using CRC in Altera FPGA Devices*.

Temperature Sensing Diode

Stratix devices include a diode-connected transistor for use as a temperature sensor in power management. This diode is used with an external digital thermometer device such as a MAX1617A or MAX1619 from MAXIM Integrated Products. These devices steer bias current through the Stratix diode, measuring forward voltage and converting this reading to temperature in the form of an 8-bit signed number (7 bits plus sign). The external device's output represents the junction temperature of the Stratix device and can be used for intelligent power management.

The diode requires two pins (tempdiodep and tempdioden) on the Stratix device to connect to the external temperature-sensing device, as shown in Figure 3–5. The temperature sensing diode is a passive element and therefore can be used before the Stratix device is powered.

Table 4–2. Stratix Device Recommended Operating Conditions (Part 2 of 2)

Symbol	Parameter	Conditions	Minimum	Maximum	Unit
V_{CCIO}	Supply voltage for output buffers, 3.3-V operation	*(4)*, *(5)*	3.00 (3.135)	3.60 (3.465)	V
	Supply voltage for output buffers, 2.5-V operation	*(4)*	2.375	2.625	V
	Supply voltage for output buffers, 1.8-V operation	*(4)*	1.71	1.89	V
	Supply voltage for output buffers, 1.5-V operation	*(4)*	1.4	1.6	V
V_I	Input voltage	*(3)*, *(6)*	–0.5	4.0	V
V_O	Output voltage		0	V_{CCIO}	V
T_J	Operating junction temperature	For commercial use	0	85	°C
		For industrial use	–40	100	°C

Table 4–3. Stratix Device DC Operating Conditions Note (7) (Part 1 of 2)

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Unit
I_I	Input pin leakage current	$V_I = V_{CCIOmax}$ to 0 V *(8)*	–10		10	µA
I_{OZ}	Tri-stated I/O pin leakage current	$V_O = V_{CCIOmax}$ to 0 V *(8)*	–10		10	µA
I_{CC0}	V_{CC} supply current (standby) (All memory blocks in power-down mode)	V_I = ground, no load, no toggling inputs				mA
		EP1S10. V_I = ground, no load, no toggling inputs		37		mA
		EP1S20. V_I = ground, no load, no toggling inputs		65		mA

Figure 4–6 shows the case where four IOE registers are located in two different I/O banks.

Figure 4–6. I/O Skew Across Two I/O Banks

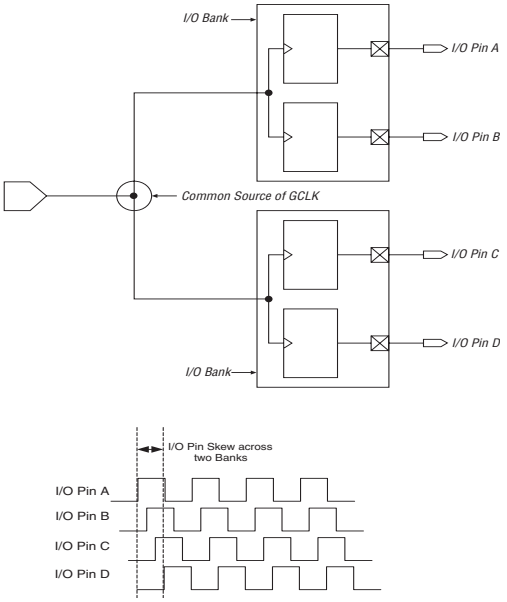

Table 4–97 defines the timing parameters used to define the timing for horizontal I/O pins (side banks 1, 2, 5, 6) and vertical I/O pins (top and bottom banks 3, 4, 7, 8). The timing parameters define the skew within an I/O bank, across two neighboring I/O banks on the same side of the device, across all horizontal I/O banks, across all vertical I/O banks, and the skew for the overall device.

Table 4–97. Output Pin Timing Skew Definitions (Part 1 of 2)

Symbol	Definition
t_{SB_HIO}	Row I/O (HIO) within one I/O bank *(1)*
t_{SB_VIO}	Column I/O (VIO) within one I/O bank *(1)*
t_{SS_HIO}	Row I/O (HIO) same side of the device, across two banks *(2)*
t_{SS_VIO}	Column I/O (VIO) same side of the device, across two banks *(2)*

External I/O Delay Parameters

External I/O delay timing parameters for I/O standard input and output adders and programmable input and output delays are specified by speed grade independent of device density. All of the timing parameters in this section apply to both flip-chip and wire-bond packages.

Tables 4–103 and 4–104 show the input adder delays associated with column and row I/O pins. If an I/O standard is selected other than 3.3-V LVTTL or LVCMOS, add the selected delay to the external t_{INSU} and $t_{INSUPLL}$ I/O parameters shown in Tables 4–54 through 4–96.

Table 4–103. Stratix I/O Standard Column Pin Input Delay Adders

Parameter	-5 Speed Grade		-6 Speed Grade		-7 Speed Grade		-8 Speed Grade		Unit
	Min	Max	Min	Max	Min	Max	Min	Max	
LVCMOS		0		0		0		0	ps
3.3-V LVTTL		0		0		0		0	ps
2.5-V LVTTL		19		19		22		26	ps
1.8-V LVTTL		221		232		266		313	ps
1.5-V LVTTL		352		369		425		500	ps
GTL		–45		–48		–55		–64	ps
GTL+		–75		–79		–91		–107	ps
3.3-V PCI		0		0		0		0	ps
3.3-V PCI-X 1.0		0		0		0		0	ps
Compact PCI		0		0		0		0	ps
AGP 1×		0		0		0		0	ps
AGP 2×		0		0		0		0	ps
CTT		120		126		144		170	ps
SSTL-3 Class I		–162		–171		–196		–231	ps
SSTL-3 Class II		–162		–171		–196		–231	ps
SSTL-2 Class I		–202		–213		–244		–287	ps
SSTL-2 Class II		–202		–213		–244		–287	ps
SSTL-18 Class I		78		81		94		110	ps
SSTL-18 Class II		78		81		94		110	ps
1.5-V HSTL Class I		–76		–80		–92		–108	ps
1.5-V HSTL Class II		–76		–80		–92		–108	ps
1.8-V HSTL Class I		–52		–55		–63		–74	ps
1.8-V HSTL Class II		–52		–55		–63		–74	ps

Table 4–122. Stratix Maximum Output Clock Rate for PLL[5, 6, 11, 12] Pins in Wire-Bond Packages (Part 1 of 2)

I/O Standard	-6 Speed Grade	-7 Speed Grade	-8 Speed Grade	Unit
LVTTL	175	150	150	MHz
2.5 V	175	150	150	MHz
1.8 V	175	150	150	MHz
1.5 V	175	150	150	MHz
