

Welcome to [E-XFL.COM](#)

Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details

Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	10 ns
Voltage Supply - Internal	3V ~ 3.6V
Number of Logic Elements/Blocks	-
Number of Macrocells	512
Number of Gates	-
Number of I/O	256
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	352-LBGA
Supplier Device Package	352-SBGA (35x35)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/m5lv-512-256-10sai

Table 2. MACH 5 Speed Grades

Note:

1. C = Commercial grade, I = Industrial grade
2. /1 version recommended for new designs

With Lattice's unique hierarchical architecture, the MACH 5 family provides densities up to 512 macrocells to support full system logic integration. Extensive routing resources ensure pinout retention as well as high utilization. It is ideal for PAL® block device integration and a wide range of other applications including high-speed computing, low-power applications, communications, and embedded control. At each macrocell density point, Lattice offers several I/O and package options to meet a wide range of design needs (Table 3).

Table 3. MACH 5 Package and I/O Options¹

352-ball BGA										256	256

Note:

1. The I/O options indicated with a "*" are obsolete, please contact factory for more information.

Advanced power management options allow designers to incrementally reduce power while maintaining the level of performance needed for today's complex designs. I/O safety features allow for mixed-voltage design,

Select devices have been discontinued.
See Ordering Information section for product status.

- ◆ Global clock (0, 1, 2, or 3) with positive and negative edge clock enable (biphase)

Clock Line 2 Options

- ◆ Global clock (0, 1, 2, or 3) with clock enable

Clock Line 3 Options

- ◆ Complement of clock line 2 (same clock enable)
- ◆ Product-term clock (if clock line 2 does not use clock enable)

20446G-004

Figure 4. Clock Generator

20446G-005

Figure 5. Set/Reset Generator

The set/reset generation portion of the control generator (Figure 5) creates three set/reset lines for the PAL block. Each macrocell can choose one of these three lines or choose no set/reset at all. All three lines can be configured for product term set/reset and two of the three lines can be configured as sum term set/reset and one of the lines can be configured as product-term or sum-term latch enable. While the set/reset signals are generated in the control generator, whether that signal sets or resets a flip-flop is determined within the individual macrocell. The same signal can set one flip-flop and reset another. PT2 or /PT2 can also be used as a latch enable for macrocells configured as latches.

Select devices have been discontinued.
See Ordering Information section for product status.

Select devices have been discontinued.
See Ordering Information section for product status.

OE Generator

There is one output enable (OE) generator per PAL block that generates two product-term driven output enables. Each I/O cell is simply an output buffer. Each I/O cell within the PAL block can choose to be permanently enabled, permanently disabled, or choose one of the two product term output enables per PAL block (Figure 6).

20446G-006

Figure 6. Output Enable Generator and I/O Cell

MACH 5 TIMING MODEL

The primary focus of the MACH 5 timing model is to accurately represent the timing in a MACH 5 device, and at the same time, be easy to understand. This model accurately describes all combinatorial and registered paths through the device, making a distinction between **internal feedback** and **external feedback**. A signal uses internal feedback when it is fed back into the switch matrix or block without having to go through the output buffer. The input register specifications are also reported as internal feedback. When a signal is fed back into the switch matrix after having gone through the output buffer, it is using external feedback.

The parameter, t_{BUF} is defined as the time it takes to go through the output buffer to the I/O pad. If a signal goes to the internal feedback rather than to the I/O pad, the parameter designator is followed by an “i”. By adding t_{BUF} to this internal parameter, the external parameter is derived. For example, $t_{PD} = t_{PDI} + t_{BUF}$. A diagram representing the modularized MACH 5 timing model is shown in Figure 7. Refer to the Technical Note entitled *MACH 5 Timing and High Speed Design* for a more detailed discussion about the timing parameters.

SAFE FOR MIXED SUPPLY VOLTAGE SYSTEM DESIGNS¹

Both the 3.3-V and 5-V V_{CC} MACH 5 devices are safe for mixed supply voltage system designs. The 5-V devices will not overdrive 3.3-V devices above the output voltage of 3.3 V, while they accept inputs from other 3.3-V devices. The 3.3-V devices will accept inputs up to 5.5 V. Both the 3.3-V and 5-V versions have the same high-speed performance and provide easy-to-use mixed-voltage design capability.

Note:

1. Excludes original M5-128, M5-192, and M5-256 while M5-128/1, M3-192/1 and M5-256/1 are supported. Please refer to Application Note titled "Hot Socketing and Mixed Supply Design with MACH 4 and MACH 5 Devices".

BUS-FRIENDLY INPUTS AND I/Os

All MACH 5 devices have inputs and I/Os which feature the Bus-Friendly circuitry incorporating two inverters in series which loop back to the input. This double inversion weakly holds the input at its last driven logic state. While it is a good design practice to tie unused pins to a known state, the Bus-Friendly input structure pulls pins away from the input threshold voltage where noise can cause high-frequency switching. At power-up, the Bus-Friendly latches are reset to a logic level "1." For the circuit diagram, please refer to the document entitled *MACH Endurance Characteristics* on the Lattice Data Book CD-ROM or Lattice web site.

POWER MANAGEMENT

There are 4 power/speed options in each MACH 5 PAL block (Table 5). The speed and power tradeoff can be tailored for each design. The signal speed paths in the lower-power PAL blocks will be slower than those in the higher-power PAL blocks. This feature allows speed critical paths to run at maximum frequency while the rest of the signal paths operate in a lower-power mode. In large designs, there may be several different speed requirements for different portions of the design.

Table 5. Power Levels

High Speed/High Power	100% Power
Medium High Speed/Medium High Power	67% Power
Medium Low Speed/Medium Low Power	40% Power
Low Speed/Low Power	20% Power

PROGRAMMABLE SLEW RATE

Each MACH 5 device I/O has an individually programmable output slew rate control bit. Each output can be individually configured for the higher speed transition (3 V/ns) or for the lower noise transition (1 V/ns). For high-speed designs with long, unterminated traces, the slow-slew rate will introduce fewer reflections, less noise, and keep ground bounce to a minimum. For designs with short traces or well terminated lines, the fast slew rate can be used to achieve the highest speed. The slew rate is adjusted independent of power.

POWER-UP RESET/SET

All flip-flops power up to a known state for predictable system initialization. If a macrocell is configured to SET on a signal from the control generator, then that macrocell will be SET during device power-up. If a macrocell is configured to RESET on a signal from the control generator or is not configured for set/reset, then that macrocell will RESET on power-up. To guarantee initialization values, the V_{CC} rise must be monotonic and the clock must be inactive until the reset delay time has elapsed.

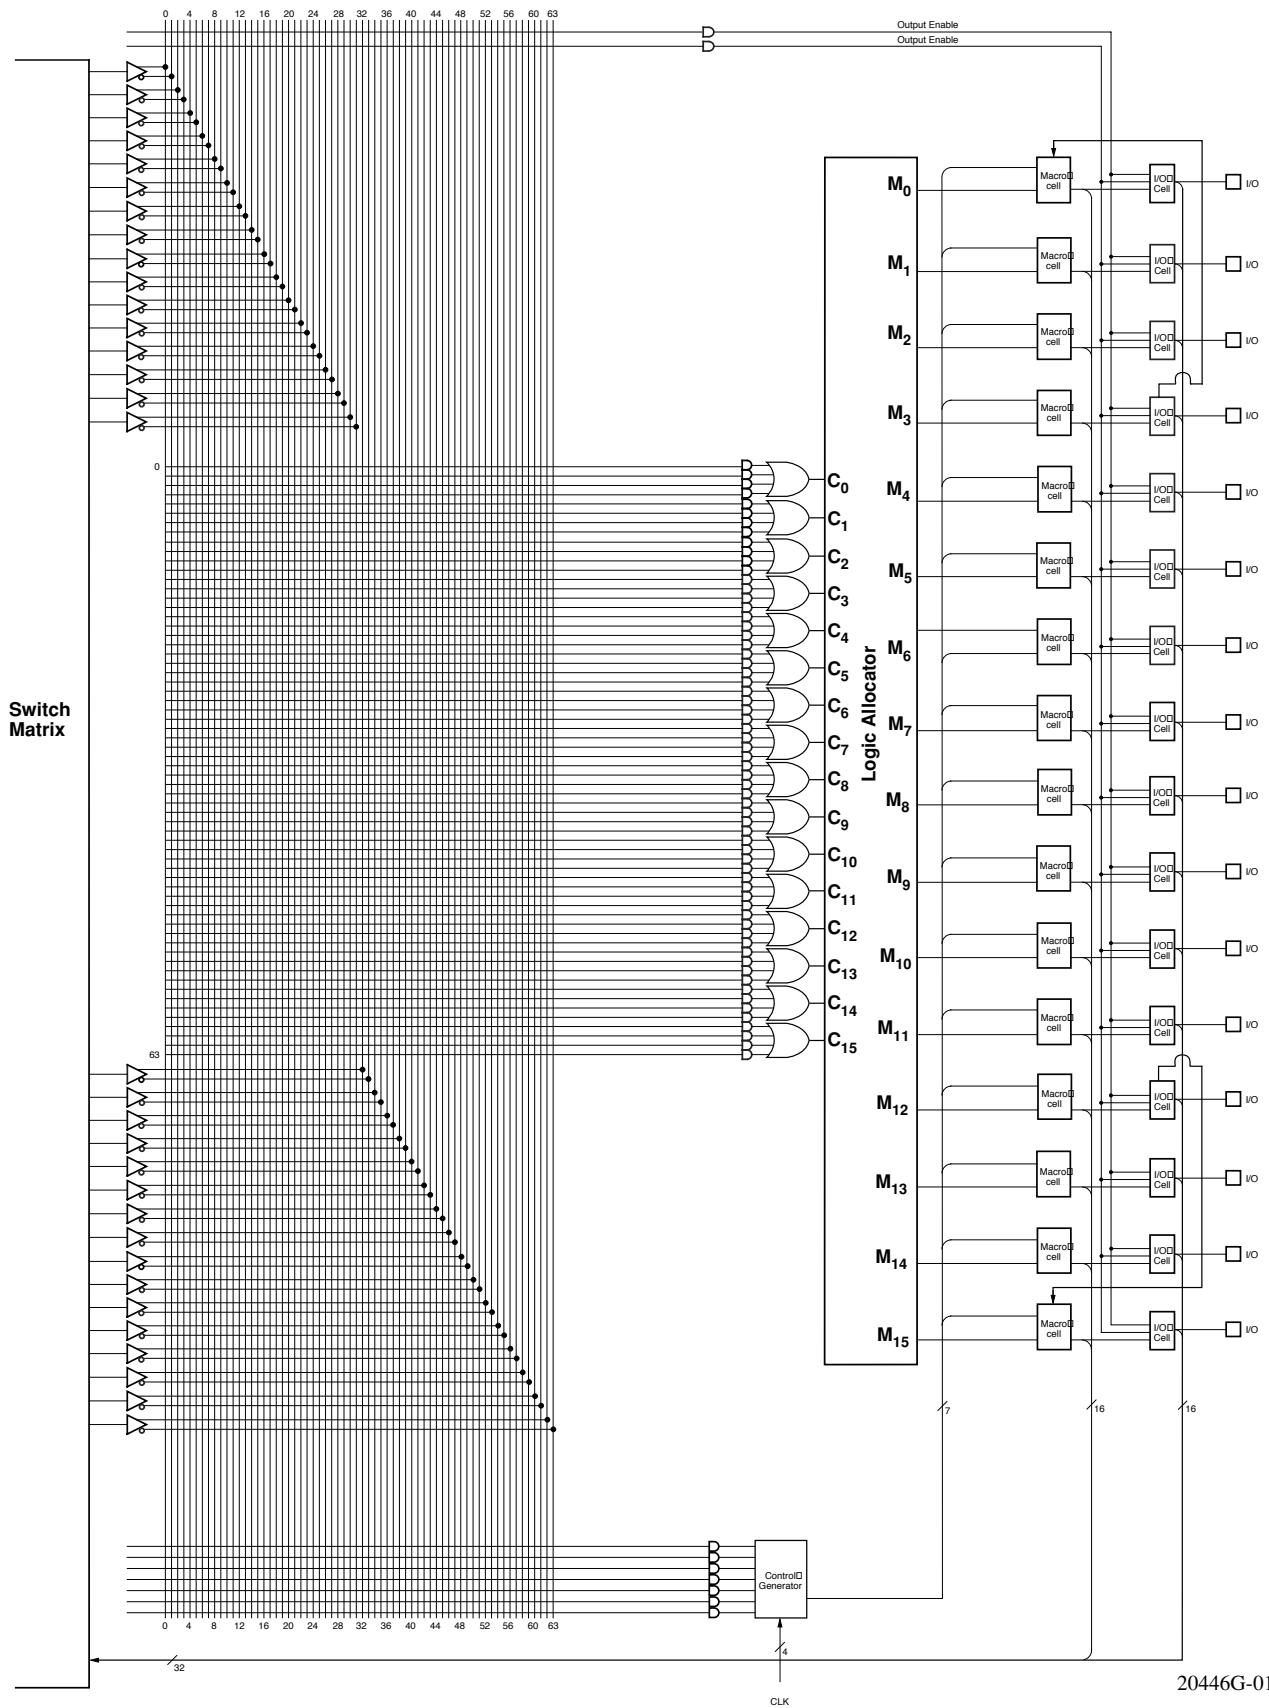

**Select devices have been discontinued.
See Ordering Information section for product status.**

Select devices have been discontinued.
See Ordering Information section for product status.

SECURITY BIT

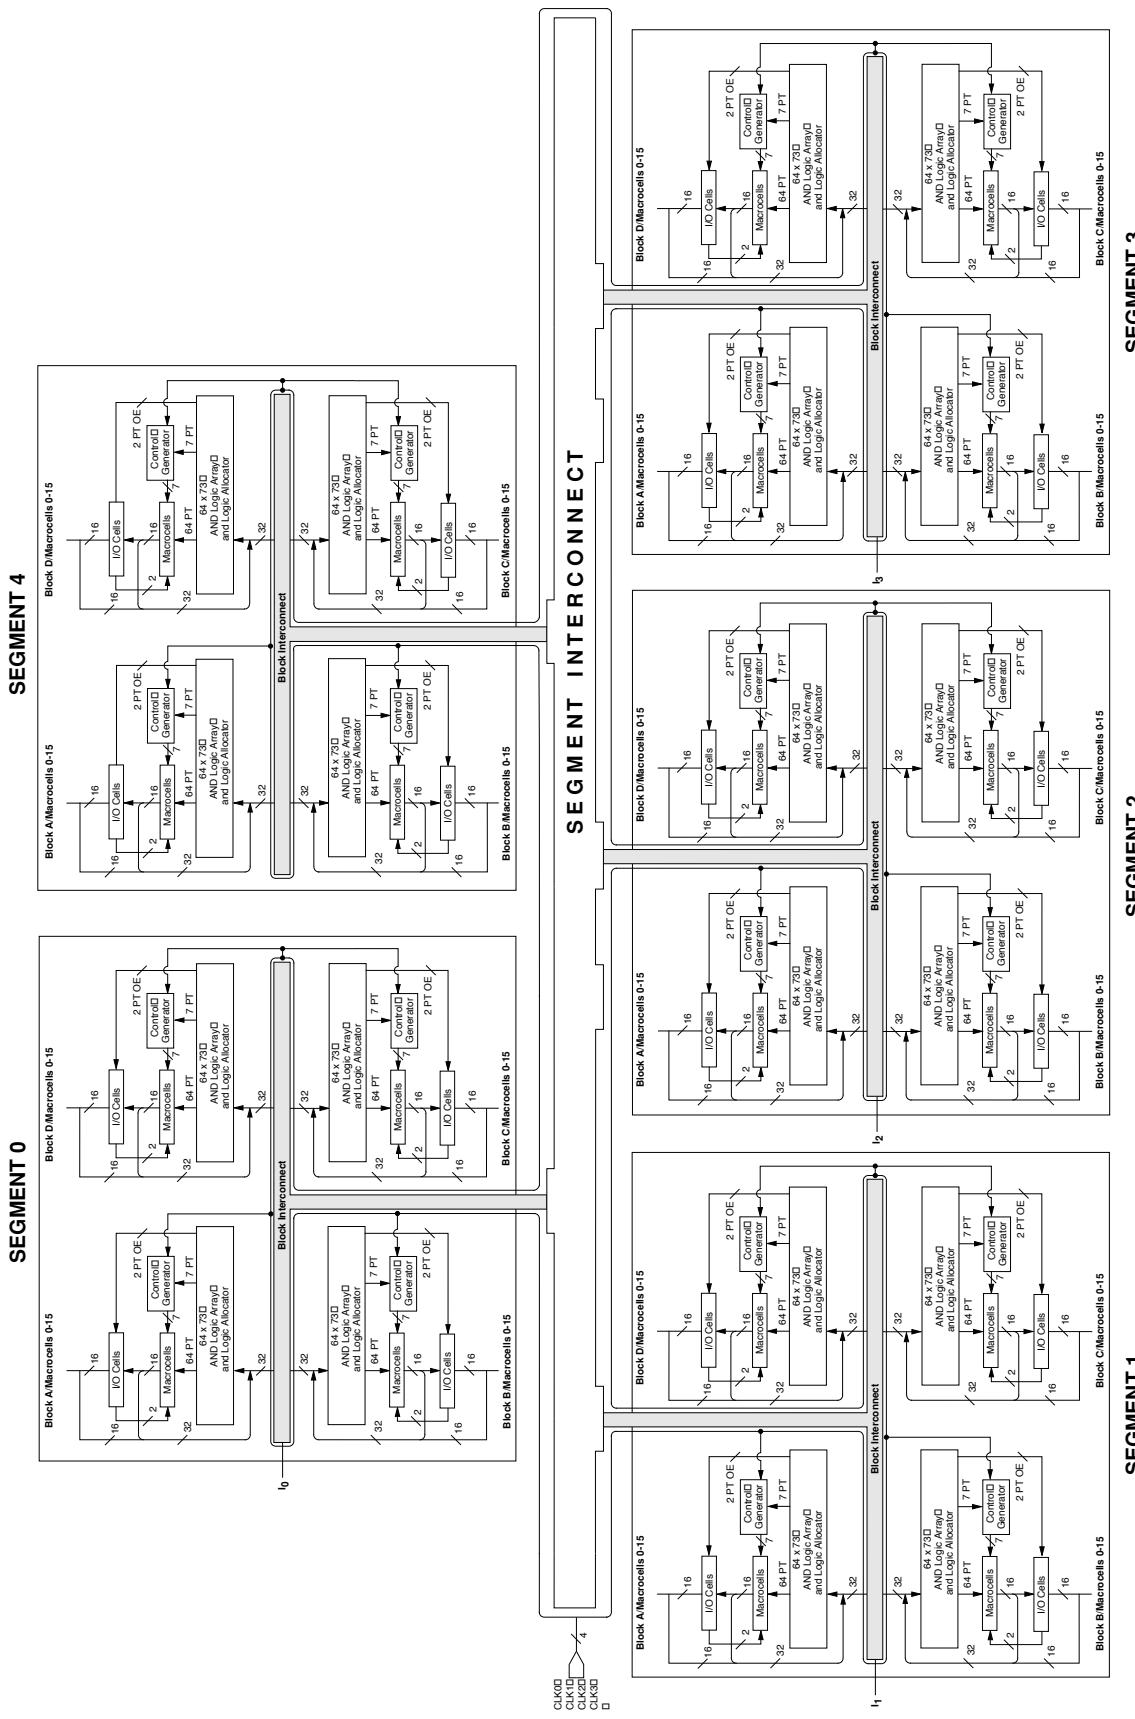

A programmable security bit is provided on the MACH 5 devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit defeats readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. Programming and verification are also defeated by the security bit. The bit can only be reset by erasing the entire device.

ABSOLUTE MAXIMUM RATINGS

M5

Storage Temperature.....	-65°C to +150°C
Device Junction Temperature (Note 1).....	+130°C or +150°C
Supply Voltage with Respect to Ground	-0.5 V to +7.0 V
DC Input Voltage	-0.5 V to 5.5 V
Static Discharge Voltage.....	2000 V
Latchup Current (-40°C to +85°C)	200 mA
<i>Stresses above those listed under Absolute Maximum Ratings may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to Absolute Maximum Ratings for extended periods may affect device reliability.</i>	

OPERATING RANGES

Commercial (C) Devices

Ambient Temperature (T_A)	
Operating in Free Air.....	0°C to +70°C
Supply Voltage (V_{CC}) with Respect to Ground.....	+4.75 V to +5.25 V

Industrial (I) Devices

Ambient Temperature (T_A)	
Operating in Free Air.....	-40°C to +85°C
Supply Voltage (V_{CC}) with Respect to Ground.....	+4.5 V to +5.5 V
<i>Operating ranges define those limits between which the functionality of the device is guaranteed.</i>	

5-V DC CHARACTERISTICS OVER OPERATING RANGES

Parameter Symbol	Parameter Description	Test Description	Min	Typ	Max	Unit
V_{OH}	Output HIGH Voltage (For M5-128/1, M5-192/1, M5-256/1, M5-320, M5-384, M5-512 Devices)	$I_{OH} = -3.2 \text{ mA}, V_{CC} = \text{Min}, V_{IN} = V_{IH} \text{ or } V_{IL}$	2.4			V
		$I_{OH} = -100 \mu\text{A}, V_{CC} = \text{Max}, V_{IN} = V_{IH} \text{ or } V_{IL}$		3.3	3.6	V
	Output HIGH Voltage (For M5-128, M5-192, M5-256 Devices)	$I_{OH} = -3.2 \text{ mA}, V_{CC} = \text{Min}, V_{IN} = V_{IH} \text{ or } V_{IL}$	2.4			V
		$I_{OH} = -2.5 \text{ mA}, V_{CC} = 5.25 \text{ V}, V_{IN} = V_{IH} \text{ or } V_{IL}$			3.6	V
V_{OL}	Output LOW Voltage (Note 2)	$I_{OL} = +16 \text{ mA}, V_{CC} = \text{Min}, V_{IN} = V_{IH} \text{ or } V_{IL}$			0.5	V
V_{IH}	Input HIGH Voltage	Guaranteed Input Logical HIGH Voltage for all Inputs (Note 3)	2.0			V
V_{IL}	Input LOW Voltage	Guaranteed Input Logical LOW Voltage for all Inputs (Note 3)			0.8	V
I_{IH}	Input HIGH Leakage Current	$V_{IN} = 5.25, V_{CC} = \text{Max}$ (Note 4)			10	μA
I_{IL}	Input LOW Leakage Current	$V_{IN} = 0, V_{CC} = \text{Max}$ (Note 4)			-10	μA
I_{OZH}	Off-State Output Leakage Current HIGH	$V_{OUT} = 5.25, V_{CC} = \text{Max}, V_{IN} = V_{IH} \text{ or } V_{IL}$ (Note 4)			10	μA
I_{OZL}	Off-State Output Leakage Current LOW	$V_{OUT} = 0, V_{CC} = \text{Max}, V_{IN} = V_{IH} \text{ or } V_{IL}$ (Note 4)			-10	μA
I_{SC}	Output Short-Circuit Current	$V_{OUT} = 0.5 \text{ V}, V_{CC} = \text{Max}, V_{IN} = V_{IH} \text{ or } V_{IL}$ (Note 5)	-30		-180	mA

Note:

- 150° for M5-128, M5-192 and M5-256 devices. 130° for M5-128/1, M5-192/1, M5-256/1, M5-320, M5-384 and M5-512 devices.
- Total I_{OL} between ground pins should not exceed 64 mA.
- These are absolute values with respect to device ground, and all overshoots due to system and/or tester noise are included.
- I/O pin leakage is the worst case of I_{IL} and I_{OZL} or I_{IH} and I_{OZH} .
- Not more than one output should be shorted at a time. Duration of the short-circuit should not exceed one second.

Select devices have been discontinued.

Pin Designations

- CLK = Clock
- GND = Ground
- I = Input
- I/O = Input/Output
- NC = No Connect
- V_{CC} = Supply Voltage
- TDI = Test Data In
- TCK = Test Clock
- TMS = Test Mode Select
- TDO = Test Data Out

3.3V M5LV ORDERING INFORMATION¹

Lattice standard products are available in several packages and operating ranges. The order number (Valid Combination) is formed by a combination of the elements below.

Note:

1. See below for valid device/package combinations.

Valid Combinations		
M5LV-128/68		VC, VI
M5LV-128/74		VC, VI
M5LV-128/104		VC, VI
M5LV-128/120	Commercial: -5, -7, -10, -12	YC, YI
M5LV-256/68		YC, YI
M5LV-256/74	Industrial: -7, -10, -12, -15	VC, VI
M5LV-256/104		VC, VI
M5LV-256/120		YC, YI
M5LV-256/160		YC, YI

Device Marking

Actual device marking differs from the ordering part number (OPN). All MACH devices are dual-marked with both Commercial and Industrial grades. The Industrial grade is slower, i.e., M5LV-512/256-7AC-10AI.

Valid Combinations		
M5LV-320/120		YC, YI
M5LV-320/160	Commercial: -6, -7, -10, -12, -15	YC, YI
M5LV-384/120		YC, YI
M5LV-384/160		YC, YI
M5LV-512/120	Industrial: -10, -12, -15, -20	YC, YI
M5LV-512/160		YC, YI
M5LV-512/256		SAC, SAI

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local Lattice sales office to confirm availability of specific valid combinations and to check on newly released combinations.
