
Welcome to E-XFL.COM

Understanding Embedded - DSP (Digital Signal Processors)

Embedded - DSP (Digital Signal Processors) are specialized microprocessors designed to perform complex mathematical computations on digital signals in real-time. Unlike general-purpose processors, DSPs are optimized for high-speed numeric processing tasks, making them ideal for applications that require efficient and precise manipulation of digital data. These processors are fundamental in converting and processing signals in various forms, including audio, video, and communication signals, ensuring that data is accurately interpreted and utilized in embedded systems.

Applications of Embedded - DSP (Digital Signal Processors)

Details	
Product Status	Active
Type	Blackfin+
Interface	CAN, DSPI, EBI/EMI, I²C, PPI, QSPI, SD/SDIO, SPI, SPORT, UART/USART, USB OTG
Clock Rate	400MHz
Non-Volatile Memory	ROM (512kB)
On-Chip RAM	256kB
Voltage - I/O	1.8V, 3.3V
Voltage - Core	1.10V
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	184-LFBGA, CSPBGA
Supplier Device Package	184-CSPBGA (12x12)
Purchase URL	https://www.e-xfl.com/product-detail/analog-devices/adsp-bf703bbcz-4

system event or fault if enabled. ECC protection is fully transparent to the user, even if L2 memory is read or written by 8-bit or 16-bit entities.

CRC-Protected Memories

While parity bit and ECC protection mainly protect against random soft errors in L1 and L2 memory cells, the CRC engines can be used to protect against systematic errors (pointer errors) and static content (instruction code) of L1, L2, and even L3 memories (DDR2, LPDDR). The processor features two CRC engines which are embedded in the memory-to-memory DMA controllers. CRC checksums can be calculated or compared on the fly during memory transfers, or one or multiple memory regions can be continuously scrubbed by a single DMA work unit as per DMA descriptor chain instructions. The CRC engine also protects data loaded during the boot process.

Memory Protection

The Blackfin+ core features a memory protection concept, which grants data and/or instruction accesses to enabled memory regions only. A supervisor mode vs. user mode programming model supports dynamically varying access rights. Increased flexibility in memory page size options supports a simple method of static memory partitioning.

System Protection

The system protection unit (SPU) guards against accidental or unwanted access to the MMR space of a peripheral by providing a write-protection mechanism. The user is able to choose and configure the peripherals that are protected as well as configure which ones of the four system MMR masters (core, memory DMA, the SPI host port, and Coresight debug) the peripherals are guarded against.

The SPU is also part of the security infrastructure. Along with providing write-protection functionality, the SPU is employed to define which resources in the system are secure or non-secure and to block access to secure resources from non-secure masters.

Synonymously, the system memory protection unit (SMPU) provides memory protection against read and/or write transactions to defined regions of memory. There are two SMPU units in the ADSP-BF70x processors. One is for the L2 memory and the other is for the external DDR memory.

The SMPU is also part of the security infrastructure. It allows the user to not only protect against arbitrary read and/or write transactions, but it also allows regions of memory to be defined as secure and prevent non-secure masters from accessing those memory regions.

Watchpoint Protection

The primary purpose of watchpoints and hardware breakpoints is to serve emulator needs. When enabled, they signal an emulator event whenever user-defined system resources are accessed or the core executes from user-defined addresses. Watchpoint events can be configured such that they signal the events to the fault management unit of the SEC.

Watchdog

The on-chip software watchdog timer can supervise the Blackfin+ core.

Bandwidth Monitor

Memory-to-memory DMA channels are equipped with a bandwidth monitor mechanism. They can signal a system event or fault when transactions tend to starve because system buses are fully loaded with higher-priority traffic.

Signal Watchdogs

The eight general-purpose timers feature modes to monitor off-chip signals. The watchdog period mode monitors whether external signals toggle with a period within an expected range. The watchdog width mode monitors whether the pulse widths of external signals are within an expected range. Both modes help to detect undesired toggling (or lack thereof) of system-level signals.

Up/Down Count Mismatch Detection

The GP counter can monitor external signal pairs, such as request/grant strobes. If the edge count mismatch exceeds the expected range, the GP counter can flag this to the processor or to the fault management unit of the SEC.

Fault Management

The fault management unit is part of the system event controller (SEC). Any system event, whether a dual-bit uncorrectable ECC error, or any peripheral status interrupt, can be defined as being a fault. Additionally, the system events can be defined as an interrupt to the core. If defined as such, the SEC forwards the event to the fault management unit, which may automatically reset the entire device for reboot, or simply toggle the $\overline{\text{SYS\_FAULT}}$ output pin to signal off-chip hardware. Optionally, the fault management unit can delay the action taken through a keyed sequence, to provide a final chance for the Blackfin+ core to resolve the issue and to prevent the fault action from being taken.

ADDITIONAL PROCESSOR PERIPHERALS

The processor contains a rich set of peripherals connected to the core through several high-bandwidth buses, providing flexibility in system configuration as well as excellent overall system performance (see the block diagram on Page 1). The processor contains high-speed serial and parallel ports, an interrupt controller for flexible management of interrupts from the on-chip peripherals or external sources, and power management control functions to tailor the performance and power characteristics of the processor and system to many application scenarios.

The following sections describe additional peripherals that were not previously described.

Timers

The processor includes several timers which are described in the following sections.

SECURITY FEATURES DISCLAIMER

To our knowledge, the Security Features, when used in accordance with the data sheet and hardware reference manual specifications, provide a secure method of implementing code and data safeguards. However, Analog Devices does not guarantee that this technology provides absolute security. ACCORDINGLY, ANALOG DEVICES HEREBY DISCLAIMS ANY AND ALL EXPRESS AND IMPLIED WARRANTIES THAT THE SECURITY FEATURES CANNOT BE BREACHED, COMPROMISED, OR OTHERWISE CIRCUMVENTED AND IN NO EVENT SHALL ANALOG DEVICES BE LIABLE FOR ANY LOSS, DAMAGE, DESTRUCTION, OR RELEASE OF DATA, INFORMATION, PHYSICAL PROPERTY, OR INTELLECTUAL PROPERTY.

Table 6. ADSP-BF70x Detailed Signal Descriptions (Continued)

Port Name	Direction	Description
USB_DM	I/O	**Data –.** Bidirectional differential data line.
USB_DP	I/O	**Data +.** Bidirectional differential data line.
USB_ID	Input	**OTG ID.** Senses whether the controller is a host or device. This signal is pulled low when an A-type plug is sensed (signifying that the USB controller is the A device), but the input is high when a B-type plug is sensed (signifying that the USB controller is the B device).
USB_VBC	Output	**VBUS Control.** Controls an external voltage source to supply VBUS when in host mode. May be configured as open-drain. Polarity is configurable as well.
USB_VBUS	I/O	**Bus Voltage.** Connects to bus voltage in host and device modes.
USB_XTAL	Output	**Crystal.** Drives an external crystal. Must be left unconnected if an external clock is driving USB_CLKIN.

ADSP-BF70x DESIGNER QUICK REFERENCE

Table 15 provides a quick reference summary of pin related information for circuit board design. The columns in this table provide the following information:

- Signal Name: The Signal Name column in the table includes the signal name for every pin and (where applicable) the GPIO multiplexed pin function for every pin.
- Pin Type: The Type column in the table identifies the I/O type or supply type of the pin. The abbreviations used in this column are na (none), I/O (input/output), a (analog), s (supply), and g (ground).
- Driver Type: The Driver Type column in the table identifies the driver type used by the pin. The driver types are defined in the output drive currents section of this data sheet.
- Internal Termination: The Int Term column in the table specifies the termination present when the processor is not in the reset or hibernate state. The abbreviations used in this column are wk (weak keeper, weakly retains previous value driven on the pin), pu (pull-up), or pd (pull-down).
- Reset Termination: The Reset Term column in the table specifies the termination present when the processor is in the reset state. The abbreviations used in this column are wk (weak keeper, weakly retains previous value driven on the pin), pu (pull-up), or pd (pull-down).
- Reset Drive: The Reset Drive column in the table specifies the active drive on the signal when the processor is in the reset state.
- Hibernate Termination: The Hiber Term column in the table specifies the termination present when the processor is in the hibernate state. The abbreviations used in this column are wk (weak keeper, weakly retains previous value driven on the pin), pu (pull-up), or pd (pull-down).
- Hibernate Drive: The Hiber Drive column in the table specifies the active drive on the signal when the processor is in the hibernate state.
- Power Domain: The Power Domain column in the table specifies the power supply domain in which the signal resides.
- Description and Notes: The Description and Notes column in the table identifies any special requirements or characteristics for the signal. If no special requirements are listed the signal may be left unconnected if it is not used. Also, for multiplexed general-purpose I/O pins, this column identifies the functions available on the pin.

If an external pull-up or pull-down resistor is required for any signal, 100 kΩ is the maximum value that can be used unless otherwise noted.

Note that for Port A, Port B, and Port C (PA_00 to PC_14), when $\overline{\text{SYS\_HWRST}}$ is low, these pads are three-state. After $\overline{\text{SYS\_HWRST}}$ is released, but before code execution begins, these pins are internally pulled up. Subsequently, the state depends on the input enable and output enable which are controlled by software.

Software control of internal pull-ups works according to the following settings in the PADS_PCFG0 register. When PADS_PCFG0 = 0: For PA_15:PA_00, PB_15:PB_00, and PC_14:PC_00, the internal pull-up is enabled when both the input enable and output enable of a particular pin are deasserted. When PADS_PCFG0 = 1: For PA_15:PA_00, PB_15:PB_00, and PC_14:PC_00, the internal pull-up is enabled as long as the output enable of a particular pin is deasserted.

There are some exceptions to this scheme:

- Internal pull-ups are always disabled if MSI mode is selected for that signal.
- The following signals enabled the internal pull-down when the output enable is de-asserted: $\overline{\text{SMC0\_AMS}}[1:0]$, $\overline{\text{SMC0\_ARE}}$, $\overline{\text{SMC0\_AWE}}$, $\overline{\text{SMC0\_AOE}}$, SMC0_ARDY, $\overline{\text{SPI0\_SEL}}[6:1]$, $\overline{\text{SPI1\_SEL}}[4:1]$, and $\overline{\text{SPI2\_SEL}}[3:1]$.

Table 16. TWI_VSEL Selections and V_{DD_EXT}/V_{BUSTWI}

TWI_DT Setting	V_{DD_EXT} Nominal	V_{BUSTWI} Min	V_{BUSTWI} Nominal	V_{BUSTWI} Max	Unit
TWI000[1]	3.30	3.13	3.30	3.47	V
TWI001	1.80	1.70	1.80	1.90	V
TWI011	1.80	3.13	3.30	3.47	V
TWI100	3.30	4.75	5.00	5.25	V

[1] Designs must comply with the V_{DD_EXT} and V_{BUSTWI} voltages specified for the default TWI_DT setting for correct JTAG boundary scan operation during reset.

Clock Related Operating Conditions

Table 17 and Table 18 describe the core clock, system clock, and peripheral clock timing requirements. The data presented in the tables applies to all speed grades (found in the Ordering Guide) except where expressly noted. Figure 6 provides a graphical representation of the various clocks and their available divider values.

Table 17. Core and System Clock Operating Conditions

Parameter		Ratio Restriction	PLLCLK Restriction	Min	Max	Unit
f_{CCLK}	Core Clock Frequency	$f_{CCLK} \geq f_{SYSCLK}$	PLLCLK = 800		400	MHz
f_{CCLK}	Core Clock Frequency	$f_{CCLK} \geq f_{SYSCLK}$	600 ≤ PLLCLK < 800		390	MHz
f_{CCLK}	Core Clock Frequency	$f_{CCLK} \geq f_{SYSCLK}$	380 ≤ PLLCLK < 600		380	MHz
f_{CCLK}	Core Clock Frequency	$f_{CCLK} \geq f_{SYSCLK}$	230.2 ≤ PLLCLK < 380		PLLCLK	MHz
f_{SYSCLK}	SYSCLK Frequency[1]		PLLCLK = 800	60	200	MHz
f_{SYSCLK}	SYSCLK Frequency[1]		600 ≤ PLLCLK < 800	60	195	MHz
f_{SYSCLK}	SYSCLK Frequency[1]		380 ≤ PLLCLK < 600	60	190	MHz
f_{SYSCLK}	SYSCLK Frequency[1]		230.2 ≤ PLLCLK < 380	60	PLLCLK ÷ 2	MHz
f_{SCLK0}	SCLK0 Frequency[1]	$f_{SYSCLK} \geq f_{SCLK0}$		30	100	MHz
f_{SCLK1}	SCLK1 Frequency	$f_{SYSCLK} \geq f_{SCLK1}$			200	MHz
f_{DCLK}	DDR2 Clock Frequency	$f_{SYSCLK} \geq f_{DCLK}$		125	200	MHz
f_{DCLK}	LPDDR Clock Frequency	$f_{SYSCLK} \geq f_{DCLK}$		10	200	MHz

[1] The minimum frequency for SYSCLK and SCLK0 applies only when the USB is used.

Power-Up Reset Timing

A power-up reset is required to place the processor in a known state after power-up. A power-up reset is initiated by asserting $\overline{\text{SYS\_HWRST}}$ and $\overline{\text{JTG\_TRST}}$. During power-up reset, all pins are high impedance except for those noted in the ADSP-BF70x Designer Quick Reference on Page 38.

Both $\overline{\text{JTG\_TRST}}$ and $\overline{\text{SYS\_HWRST}}$ need to be asserted upon power-up, but only $\overline{\text{SYS\_HWRST}}$ needs to be released for the device to boot properly. $\overline{\text{JTG\_TRST}}$ may be asserted indefinitely for normal operation. $\overline{\text{JTG\_TRST}}$ only needs to be released when using an emulator to connect to the DAP for debug or boundary scan. There is an internal pull-down on $\overline{\text{JTG\_TRST}}$ to ensure internal emulation logic will always be properly initialized during power-up reset.

Table 30 and Figure 9 show the relationship between power supply startup and processor reset timing, related to the clock generation unit (CGU) and reset control unit (RCU). In Figure 9, $V_{DD\_SUPPLIES}$ are V_{DD_INT}, V_{DD_EXT}, V_{DD_DMC}, V_{DD_USB}, V_{DD_RTC}, V_{DD_OTP}, and V_{DD_HADC}.

There is no power supply sequencing requirement for the ADSP-BF70x processor. However, if saving power during power-on is important, bringing up V_{DD_INT} last is recommended. This avoids a small current drain in the V_{DD_INT} domain during the transition period of I/O voltages from 0 V to within the voltage specification.

Table 30. Power-Up Reset Timing

Parameter		Min	Max	Unit
Timing Requirement				
$t_{RST\_IN\_PWR}$	$\overline{\text{SYS\_HWRST}}$ and $\overline{\text{JTG\_TRST}}$ Deasserted After V_{DD_INT}, V_{DD_DMC}, V_{DD_USB}, V_{DD_RTC}, V_{DD_OTP}, V_{DD_HADC}, and SYS_CLKIN are Stable and Within Specification	$11 \times t_{CKIN}$		ns
t_{VDDEXT_RST}	$\overline{\text{SYS\_HWRST}}$ Deasserted After V_{DD_EXT} is Stable and Within Specifications (No External Pull-Down on $\overline{\text{JTG\_TRST}}$)	10		µs
t_{VDDEXT_RST}	$\overline{\text{SYS\_HWRST}}$ Deasserted After V_{DD_EXT} is Stable and Within Specifications (10k External Pull-Down on $\overline{\text{JTG\_TRST}}$)	1		µs

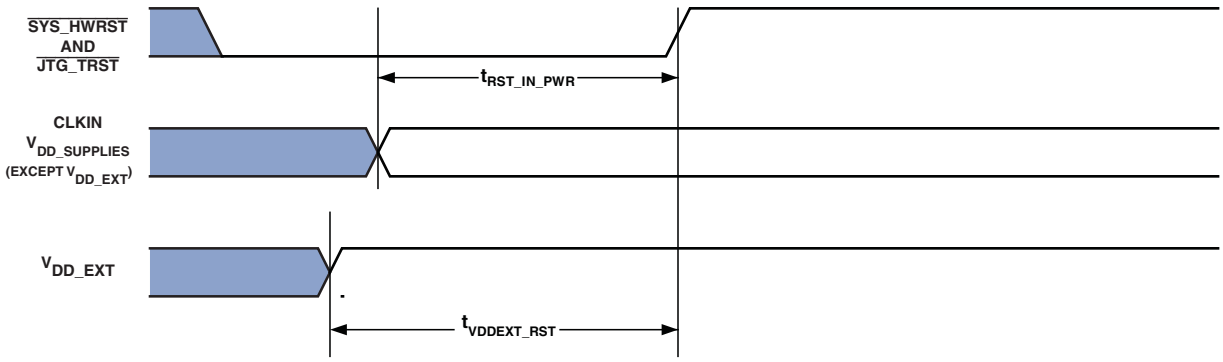

Figure 9. Power-Up Reset Timing

DDR2 SDRAM Read Cycle Timing

Table 40 and Figure 18 show DDR2 SDRAM read cycle timing, related to the dynamic memory controller (DMC).

Table 40. DDR2 SDRAM Read Cycle Timing, V_{DD_DMC} Nominal 1.8 V

Parameter		200 MHz[1] Min	Max	Unit
Timing Requirements				
t_{DQSQ}	DMC0_DQS-DMC0_DQ Skew for DMC0_DQS and Associated DMC0_DQ Signals		0.35	ns
t_{QH}	DMC0_DQ, DMC0_DQS Output Hold Time From DMC0_DQS	1.8		ns
t_{RPRE}	Read Preamble	0.9		t_{CK}
t_{RPST}	Read Postamble	0.4		t_{CK}

[1] To ensure proper operation of the DDR2, all the DDR2 guidelines have to be strictly followed.

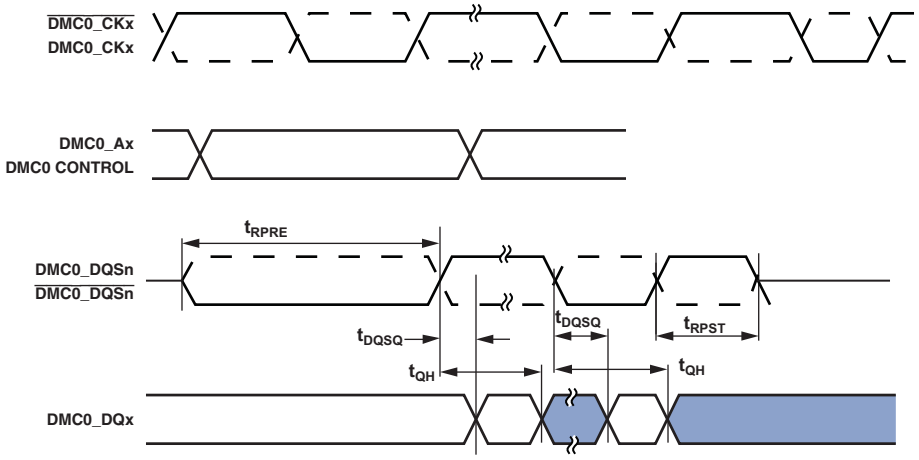

Figure 18. DDR2 SDRAM Controller Input AC Timing

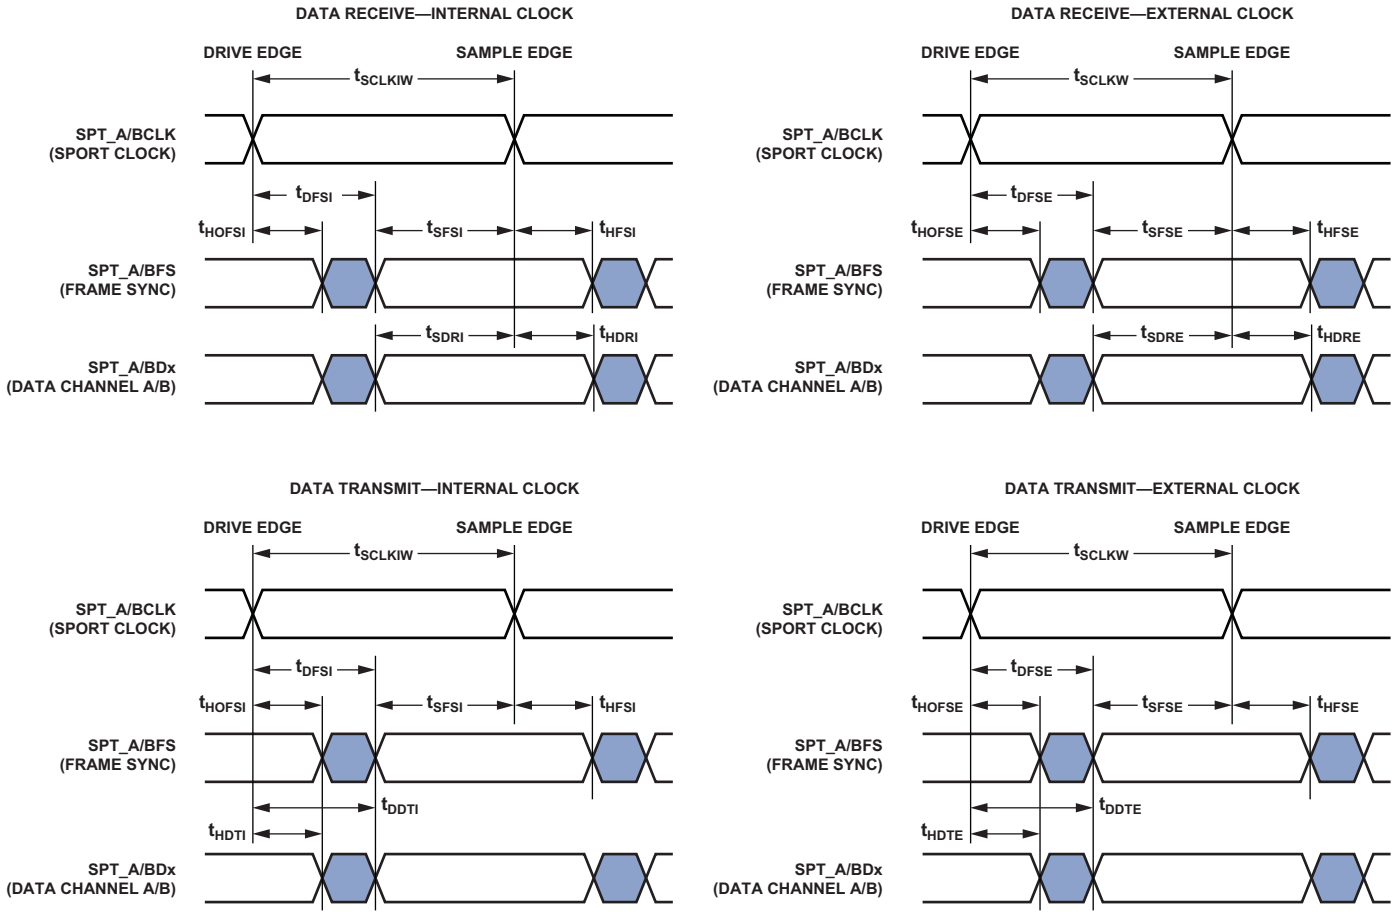

Figure 27. Serial Ports

Table 51. Serial Ports—Enable and Three-State

Parameter		V_{DD_EXT} 1.8 V Nominal Min	V_{DD_EXT} 1.8 V Nominal Max	V_{DD_EXT} 3.3 V Nominal Min	V_{DD_EXT} 3.3 V Nominal Max	Unit
Switching Characteristics						
t_{DDTEN}	Data Enable from External Transmit SPT_CLK[1]	1		1		ns
t_{DDTTE}	Data Disable from External Transmit SPT_CLK[1]		14		14	ns
t_{DDTIN}	Data Enable from Internal Transmit SPT_CLK[1]	–1.12		–1		ns
t_{DDTTI}	Data Disable from Internal Transmit SPT_CLK[1]		2.8		2.8	ns
