

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - DSP \(Digital Signal Processors\)](#)

[Embedded - DSP \(Digital Signal Processors\)](#) are specialized microprocessors designed to perform complex mathematical computations on digital signals in real-time. Unlike general-purpose processors, DSPs are optimized for high-speed numeric processing tasks, making them ideal for applications that require efficient and precise manipulation of digital data. These processors are fundamental in converting and processing signals in various forms, including audio, video, and communication signals, ensuring that data is accurately interpreted and utilized in embedded systems.

Applications of [Embedded - DSP \(Digital Signal Processors\)](#)

Details	
Product Status	Active
Type	Blackfin+
Interface	CAN, DSPI, EBI/EMI, I ² C, PPI, QSPI, SD/SDIO, SPI, SPORT, UART/USART, USB OTG
Clock Rate	400MHz
Non-Volatile Memory	ROM (512kB)
On-Chip RAM	512kB
Voltage - I/O	1.8V, 3.3V
Voltage - Core	1.10V
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	88-VFQFN Exposed Pad, CSP
Supplier Device Package	88-LFCSP-VQ (12x12)
Purchase URL	https://www.e-xfl.com/product-detail/analog-devices/adsp-bf704kcpz-4

ADSP-BF700/701/702/703/704/705/706/707

- A similar buffer that interrupts on fractional buffers (for example, 1/2, 1/4).
- 1D DMA—uses a set of identical ping-pong buffers defined by a linked ring of two-word descriptor sets, each containing a link pointer and an address.
- 1D DMA—uses a linked list of 4 word descriptor sets containing a link pointer, an address, a length, and a configuration.
- 2D DMA—uses an array of one-word descriptor sets, specifying only the base DMA address.
- 2D DMA—uses a linked list of multi-word descriptor sets, specifying everything.

Event Handling

The processor provides event handling that supports both nesting and prioritization. Nesting allows multiple event service routines to be active simultaneously. Prioritization ensures that servicing of a higher-priority event takes precedence over servicing of a lower-priority event. The processor provides support for five different types of events:

- Emulation—An emulation event causes the processor to enter emulation mode, allowing command and control of the processor through the JTAG interface.
- Reset—This event resets the processor.
- Nonmaskable interrupt (NMI)—The NMI event can be generated either by the software watchdog timer, by the NMI input signal to the processor, or by software. The NMI event is frequently used as a power-down indicator to initiate an orderly shutdown of the system.
- Exceptions—Events that occur synchronously to program flow (in other words, the exception is taken before the instruction is allowed to complete). Conditions such as data alignment violations and undefined instructions cause exceptions.
- Interrupts —Events that occur asynchronously to program flow. They are caused by input signals, timers, and other peripherals, as well as by an explicit software instruction.

System Event Controller (SEC)

The SEC manages the enabling, prioritization, and routing of events from each system interrupt or fault source. Additionally, it provides notification and identification of the highest priority active system interrupt request to the core and routes system fault sources to its integrated fault management unit. The SEC triggers core general-purpose interrupt IVG11. It is recommended that IVG11 be set to allow self-nesting. The four lower priority interrupts (IVG15-12) may be used for software interrupts.

Trigger Routing Unit (TRU)

The TRU provides system-level sequence control without core intervention. The TRU maps trigger masters (generators of triggers) to trigger slaves (receivers of triggers). Slave endpoints can be configured to respond to triggers in various ways. Common applications enabled by the TRU include:

- Automatically triggering the start of a DMA sequence after a sequence from another DMA channel completes
- Software triggering
- Synchronization of concurrent activities

General-Purpose I/O (GPIO)

Each general-purpose port pin can be individually controlled by manipulation of the port control, status, and interrupt registers:

- GPIO direction control register—Specifies the direction of each individual GPIO pin as input or output.
- GPIO control and status registers—A write one to modify mechanism allows any combination of individual GPIO pins to be modified in a single instruction, without affecting the level of any other GPIO pins.
- GPIO interrupt mask registers—Allow each individual GPIO pin to function as an interrupt to the processor. GPIO pins defined as inputs can be configured to generate hardware interrupts, while output pins can be triggered by software interrupts.
- GPIO interrupt sensitivity registers—Specify whether individual pins are level- or edge-sensitive and specify—if edge-sensitive—whether just the rising edge or both the rising and falling edges of the signal are significant.

Pin Interrupts

Every port pin on the processor can request interrupts in either an edge-sensitive or a level-sensitive manner with programmable polarity. Interrupt functionality is decoupled from GPIO operation. Three system-level interrupt channels (PINT0–3) are reserved for this purpose. Each of these interrupt channels can manage up to 32 interrupt pins. The assignment from pin to interrupt is not performed on a pin-by-pin basis. Rather, groups of eight pins (half ports) can be flexibly assigned to interrupt channels.

Every pin interrupt channel features a special set of 32-bit memory-mapped registers that enable half-port assignment and interrupt management. This includes masking, identification, and clearing of requests. These registers also enable access to the respective pin states and use of the interrupt latches, regardless of whether the interrupt is masked or not. Most control registers feature multiple MMR address entries to write-one-to-set or write-one-to-clear them individually.

Pin Multiplexing

The processor supports a flexible multiplexing scheme that multiplexes the GPIO pins with various peripherals. A maximum of 4 peripherals plus GPIO functionality is shared by each GPIO pin. All GPIO pins have a bypass path feature—that is, when the

Serial Peripheral Interface (SPI) Ports

The processors have three industry-standard SPI-compatible ports that allow it to communicate with multiple SPI-compatible devices.

The baseline SPI peripheral is a synchronous, four-wire interface consisting of two data pins, one device select pin, and a gated clock pin. The two data pins allow full-duplex operation to other SPI-compatible devices. An additional two (optional) data pins are provided to support quad SPI operation. Enhanced modes of operation such as flow control, fast mode, and dual I/O mode (DIOM) are also supported. In addition, a direct memory access (DMA) mode allows for transferring several words with minimal CPU interaction.

With a range of configurable options, the SPI ports provide a glueless hardware interface with other SPI-compatible devices in master mode, slave mode, and multimaster environments. The SPI peripheral includes programmable baud rates, clock phase, and clock polarity. The peripheral can operate in a multimaster environment by interfacing with several other devices, acting as either a master device or a slave device. In a multimaster environment, the SPI peripheral uses open-drain outputs to avoid data bus contention. The flow control features enable slow slave devices to interface with fast master devices by providing an SPI Ready pin which flexibly controls the transfers.

The SPI port's baud rate and clock phase/polarities are programmable, and it has integrated DMA channels for both transmit and receive data streams.

SPI Host Port (SPIHP)

The processor includes one SPI host port which may be used in conjunction with any available SPI port to enhance its SPI slave mode capabilities. The SPIHP allows a SPI host device access to memory-mapped resources of the processor through a SPI SRAM/FLASH style protocol. The following features are included:

- Direct read/write of memory and memory-mapped registers
- Support for pre-fetch for faster reads
- Support for SPI controllers that implement hardware-based SPI memory protocol
- Error capture and reporting for protocol errors, bus errors, and over/underflow

UART Ports

The processor provides two full-duplex universal asynchronous receiver/transmitter (UART) ports, which are fully compatible with PC-standard UARTs. Each UART port provides a simplified UART interface to other peripherals or hosts, supporting full-duplex, DMA-supported, asynchronous transfers of serial data. A UART port includes support for five to eight data bits, and none, even, or odd parity. Optionally, an additional address bit can be transferred to interrupt only addressed nodes in multi-drop bus (MDB) systems. A frame is terminated by a configurable number of stop bits.

The UART ports support automatic hardware flow control through the clear to send (CTS) input and request to send (RTS) output with programmable assertion FIFO levels.

To help support the local interconnect network (LIN) protocols, a special command causes the transmitter to queue a break command of programmable bit length into the transmit buffer. Similarly, the number of stop bits can be extended by a programmable inter-frame space.

The capabilities of the UARTs are further extended with support for the Infrared Data Association (IrDA®) serial infrared physical layer link specification (SIR) protocol.

2-Wire Controller Interface (TWI)

The processor includes a 2-wire interface (TWI) module for providing a simple exchange method of control data between multiple devices. The TWI module is compatible with the widely used I²C bus standard. The TWI module offers the capabilities of simultaneous master and slave operation and support for both 7-bit addressing and multimedia data arbitration. The TWI interface utilizes two pins for transferring clock (TWI_SCL) and data (TWI_SDA) and supports the protocol at speeds up to 400k bits/sec. The TWI interface pins are compatible with 5 V logic levels.

Additionally, the TWI module is fully compatible with serial camera control bus (SCCB) functionality for easier control of various CMOS camera sensor devices.

Mobile Storage Interface (MSI)

The mobile storage interface (MSI) controller acts as the host interface for multimedia cards (MMC), secure digital memory cards (SD), and secure digital input/output cards (SDIO). The following list describes the main features of the MSI controller:

- Support for a single MMC, SD memory, and SDIO card
- Support for 1-bit and 4-bit SD modes
- Support for 1-bit, 4-bit, and 8-bit MMC modes
- Support for eMMC 4.5 embedded NAND flash devices
- Support for power management and clock control
- An eleven-signal external interface with clock, command, optional interrupt, and up to eight data lines
- Card interface clock generation from SCLK0 or SCLK1
- SDIO interrupt and read wait features

Controller Area Network (CAN)

A CAN controller implements the CAN 2.0B (active) protocol. This protocol is an asynchronous communications protocol used in both industrial and automotive control systems. The CAN protocol is well suited for control applications due to its capability to communicate reliably over a network. This is because the protocol incorporates CRC checking, message error tracking, and fault node confinement.

ADSP-BF700/701/702/703/704/705/706/707

ADSP-BF70x DESIGNER QUICK REFERENCE

Table 15 provides a quick reference summary of pin related information for circuit board design. The columns in this table provide the following information:

- **Signal Name:** The Signal Name column in the table includes the signal name for every pin and (where applicable) the GPIO multiplexed pin function for every pin.
- **Pin Type:** The Type column in the table identifies the I/O type or supply type of the pin. The abbreviations used in this column are na (none), I/O (input/output), a (analog), s (supply), and g (ground).
- **Driver Type:** The Driver Type column in the table identifies the driver type used by the pin. The driver types are defined in the output drive currents section of this data sheet.
- **Internal Termination:** The Int Term column in the table specifies the termination present when the processor is not in the reset or hibernate state. The abbreviations used in this column are wk (weak keeper, weakly retains previous value driven on the pin), pu (pull-up), or pd (pull-down).
- **Reset Termination:** The Reset Term column in the table specifies the termination present when the processor is in the reset state. The abbreviations used in this column are wk (weak keeper, weakly retains previous value driven on the pin), pu (pull-up), or pd (pull-down).
- **Reset Drive:** The Reset Drive column in the table specifies the active drive on the signal when the processor is in the reset state.
- **Hibernate Termination:** The Hiber Term column in the table specifies the termination present when the processor is in the hibernate state. The abbreviations used in this column are wk (weak keeper, weakly retains previous value driven on the pin), pu (pull-up), or pd (pull-down).
- **Hibernate Drive:** The Hiber Drive column in the table specifies the active drive on the signal when the processor is in the hibernate state.

- **Power Domain:** The Power Domain column in the table specifies the power supply domain in which the signal resides.
- **Description and Notes:** The Description and Notes column in the table identifies any special requirements or characteristics for the signal. If no special requirements are listed the signal may be left unconnected if it is not used. Also, for multiplexed general-purpose I/O pins, this column identifies the functions available on the pin.

If an external pull-up or pull-down resistor is required for any signal, 100 kΩ is the maximum value that can be used unless otherwise noted.

Note that for Port A, Port B, and Port C (PA_00 to PC_14), when $\overline{\text{SYS_HWRST}}$ is low, these pads are three-state. After $\overline{\text{SYS_HWRST}}$ is released, but before code execution begins, these pins are internally pulled up. Subsequently, the state depends on the input enable and output enable which are controlled by software.

Software control of internal pull-ups works according to the following settings in the PADS_PCFG0 register. When PADS_PCFG0 = 0: For PA_15:PA_00, PB_15:PB_00, and PC_14:PC_00, the internal pull-up is enabled when both the input enable and output enable of a particular pin are deasserted. When PADS_PCFG0 = 1: For PA_15:PA_00, PB_15:PB_00, and PC_14:PC_00, the internal pull-up is enabled as long as the output enable of a particular pin is deasserted.

There are some exceptions to this scheme:

- Internal pull-ups are always disabled if MSI mode is selected for that signal.
- The following signals enabled the internal pull-down when the output enable is de-asserted: $\overline{\text{SMC0_AMS}}[1:0]$, $\overline{\text{SMC0_ARE}}$, $\overline{\text{SMC0_AWE}}$, $\overline{\text{SMC0_AOE}}$, $\overline{\text{SMC0_ARDY}}$, $\overline{\text{SPIO_SEL}}[6:1]$, $\overline{\text{SPI1_SEL}}[4:1]$, and $\overline{\text{SPI2_SEL}}[3:1]$.

Table 15. ADSP-BF70x Designer Quick Reference (Continued)

Signal Name	Type	Driver Type	Int Term	Reset Term	Reset Drive	Hiber Term	Hiber Drive	Power Domain	Description and Notes
VDD_OTP	s	na	none	none	none	none	none	na	Desc: VDD for OTP Notes: Must be powered.
VDD_RTC	s	na	none	none	none	none	none	na	Desc: VDD for RTC Notes: If RTC is not used, connect to ground.
VDD_USB	s	na	none	none	none	none	none	na	Desc: VDD for USB Notes: If USB is not used, connect to VDD_EXT.

ADSP-BF700/701/702/703/704/705/706/707

Asynchronous Flash Read

Table 33 and Figure 12 show asynchronous flash memory read timing, related to the static memory controller (SMC).

Table 33. Asynchronous Flash Read

Parameter		V_{DD_EXT} 1.8 V/3.3V Nominal		Unit
		Min	Max	
<i>Switching Characteristics</i>				
t_{AMSADV}	$\overline{SMC0_Ax}$ (Address)/ $\overline{SMC0_AMSx}$ Assertion Before $SMC0_NORDV$ Low ¹	$PREST \times t_{SCLK0} - 2$		ns
t_{WADV}	$SMC0_NORDV$ Active Low Width ²	$RST \times t_{SCLK0} - 2$		ns
$t_{DADVARE}$	$\overline{SMC0_ARE}$ Low Delay From $SMC0_NORDV$ High ³	$PREAT \times t_{SCLK0} - 2$		ns
t_{HARE}	Output ⁴ Hold After $\overline{SMC0_ARE}$ High ⁵	$RHT \times t_{SCLK0} - 2$		ns
t_{WARE} ⁶	$\overline{SMC0_ARE}$ Active Low Width ⁷	$RAT \times t_{SCLK0} - 2$		ns

¹ PREST value set using the SMC_BxETIM.PREST bits.

² RST value set using the SMC_BxTIM.RST bits.

³ PREAT value set using the SMC_BxETIM.PREAT bits.

⁴ Output signals are $SMC0_Ax$, $SMC0_AMS$, $SMC0_AOE$.

⁵ RHT value set using the SMC_BxTIM.RHT bits.

⁶ $SMC0_BxCTL.ARDYEN$ bit = 0.

⁷ RAT value set using the SMC_BxTIM.RAT bits.

Figure 12. Asynchronous Flash Read

ADSP-BF700/701/702/703/704/705/706/707

Asynchronous Flash Write

Table 37 and Figure 16 show asynchronous flash memory write timing, related to the static memory controller (SMC).

Table 37. Asynchronous Flash Write

Parameter	V_{DD_EXT} 1.8V/3.3V Nominal		Unit
	Min	Max	
<i>Switching Characteristics</i>			
t_{AMSADV}	$\overline{SMC0_Ax}/\overline{SMC0_AMSx}$ Assertion Before ADV Low ¹		ns
$t_{DADVAWE}$	$\overline{SMC0_AWE}$ Low Delay From ADV High ²		ns
t_{WADV}	NR_ADV Active Low Width ³		ns
t_{HAWE}	Output ⁴ Hold After $\overline{SMC0_AWE}$ High ⁵		ns
t_{WAVE} ⁶	$\overline{SMC0_AWE}$ Active Low Width ⁷		ns

¹ PREST value set using the SMC_BxETIM.PREST bits.

² PREAT value set using the SMC_BxETIM.PREAT bits.

³ WST value set using the SMC_BxTIM.WST bits.

⁴ Output signals are DATA, SMC0_Ax, $\overline{SMC0_AMSx}$, SMC0_ABE_x.

⁵ WHT value set using the SMC_BxTIM.WHT bits.

⁶ SMC_BxCTL.ARDYEN bit = 0.

⁷ WAT value set using the SMC_BxTIM.WAT bits.

Figure 16. Asynchronous Flash Write

All Accesses

Table 38 describes timing that applies to all memory accesses, related to the static memory controller (SMC).

Table 38. All Accesses

Parameter	V_{DD_EXT} 1.8V Nominal		V_{DD_EXT} 3.3V Nominal		Unit
	Min	Max	Min	Max	
<i>Switching Characteristic</i>					
t_{TURN}	$\overline{SMC0_AMSx}$ Inactive Width		$(IT + TT) \times t_{SCLK0} - 2$		ns

ADSP-BF700/701/702/703/704/705/706/707

Mobile DDR SDRAM Read Cycle Timing

Table 43 and Figure 21 show mobile DDR SDRAM read cycle timing, related to the dynamic memory controller (DMC).

Table 43. Mobile DDR SDRAM Read Cycle Timing, V_{DD_DMC} Nominal 1.8 V

Parameter		200 MHz		Unit
		Min	Max	
<i>Timing Requirements</i>				
t_{QH}	DMC0_DQ, DMC0_DQS Output Hold Time From DMC0_DQS	1.5		ns
t_{DQSQ}	DMC0_DQS-DMC0_DQ Skew for DMC0_DQS and Associated DMC0_DQ Signals		0.7	ns
t_{RPRE}	Read Preamble	0.9	1.1	t_{CK}
t_{RPST}	Read Postamble	0.4	0.6	t_{CK}

Figure 21. Mobile DDR SDRAM Controller Input AC Timing

ADSP-BF700/701/702/703/704/705/706/707

Mobile DDR SDRAM Write Cycle Timing

Table 44 and Figure 22 show mobile DDR SDRAM write cycle timing, related to the dynamic memory controller (DMC).

Table 44. Mobile DDR SDRAM Write Cycle Timing, V_{DD_DMC} Nominal 1.8 V

Parameter	200 MHz		Unit
	Min	Max	
<i>Switching Characteristics</i>			
t_{DQSS}^1	DMC0_DQS Latching Rising Transitions to Associated Clock Edges		t_{CK}
t_{DS}	Last Data Valid to DMC0_DQS Delay (Slew > 1 V/ns)		ns
t_{DH}	DMC0_DQS to First Data Invalid Delay (Slew > 1 V/ns)		ns
t_{DSS}	DMC0_DQS Falling Edge to Clock Setup Time		t_{CK}
t_{DSH}	DMC0_DQS Falling Edge Hold Time From DMC0_CK		t_{CK}
t_{DQSH}	DMC0_DQS Input High Pulse Width		t_{CK}
t_{DQSL}	DMC0_DQS Input Low Pulse Width		t_{CK}
t_{WPRE}	Write Preamble		t_{CK}
t_{WPST}	Write Postamble		t_{CK}
t_{IPW}	Address and Control Output Pulse Width		ns
t_{DIPW}	DMC0_DQ and DMC0_DM Output Pulse Width		ns

¹ Write command to first DMC0_DQS delay = $WL \times t_{CK} + t_{DQSS}$.

Figure 22. Mobile DDR SDRAM Controller Output AC Timing

ADSP-BF700/701/702/703/704/705/706/707

Debug Interface (JTAG Emulation Port) Timing

Table 48 and Figure 26 provide I/O timing, related to the debug interface (JTAG emulator port).

Table 48. JTAG Port Timing

Parameter	V_{DD_EXT} 1.8V Nominal		V_{DD_EXT} 3.3V Nominal		Unit
	Min	Max	Min	Max	
<i>Timing Requirements</i>					
t_{TCK}	JTG_TCK Period		20	20	ns
t_{STAP}	JTG_TDI, JTG_TMS Setup Before JTG_TCK High		5	4	ns
t_{HTAP}	JTG_TDI, JTG_TMS Hold After JTG_TCK High		4	4	ns
t_{SSYS}	System Inputs Setup Before JTG_TCK High ¹		4	4	ns
t_{HSYS}	System Inputs Hold After JTG_TCK High ¹		4	4	ns
t_{TRSTW}	JTG_TRST Pulse Width (Measured in JTG_TCK Cycles) ²		4	4	t_{TCK}
<i>Switching Characteristics</i>					
t_{DIDO}	JTG_TDO Delay From JTG_TCK Low			16.5	ns
t_{DSYS}	System Outputs Delay After JTG_TCK Low ³			18	ns
t_{DTMS}	TMS Delay After TCK High in SWD Mode		3.5	16.5	ns

¹ System inputs = DMC0_DQxx, DMC0_LDQS, DMC0_LDQS, DMC0_UDQS, DMC0_UDQS, PA_xx, PB_xx, PC_xx, SYS_BMODEx, SYS_HWRST, SYS_FAULT, SYS_NMI, TWI0_SCL, TWI0_SDA, and SYS_EXTWAKE.

² 50 MHz maximum.

³ System outputs = DMC0_Axx, DMC0_BAx, DMC0_CAS, DMC0_CK, DMC0_CK, DMC0_CKE, DMC0_CS0, DMC0_DQxx, DMC0_LDM, DMC0_LDQS, DMC0_LDQS, DMC0_ODT, DMC0_RAS, DMC0_UDM, DMC0_UDQS, DMC0_UDQS, DMC0_WE, PA_xx, PB_xx, PC_xx, SYS_CLKOUT, SYS_FAULT, SYS_RESOUT, and SYS_NMI.

Universal Asynchronous Receiver-Transmitter (UART) Ports—Receive and Transmit Timing

The universal asynchronous receiver-transmitter (UART) ports receive and transmit operations are described in the *ADSP-BF70x Blackfin+ Processor Hardware Reference*.

Controller Area Network (CAN) Interface

The controller area network (CAN) interface timing is described in the *ADSP-BF70x Blackfin+ Processor Hardware Reference*.

Universal Serial Bus (USB) On-The-Go—Receive and Transmit Timing

[Table 62](#) describes the universal serial bus (USB) on-the-go receive and transmit operations.

Table 62. USB On-The-Go—Receive and Transmit Timing

Parameter		V_{DD_USB} 3.3V Nominal		Unit
		Min	Max	
<i>Timing Requirements</i>				
f_{USB}	USB_XI Frequency	24	24	MHz
$f_{S_{USB}}$	USB_XI Clock Frequency Stability	-50	+50	ppm
